What Are You Looking For
From a Printer and Binder?

Equipment The necessary modern efficient machinery and buildings to economically and speedily produce the printing and binding required.

Personnel An organization of thoroughly trained men and women to operate the plant and deliver according to agreement, both as to time and quality.

Experience Forty-six years of active continuous operation under the same name and management.

Our advice is to place your printing and binding with a firm that you know has these qualifications.

Your inquiries will be given our utmost care and attention.

Gathering Cost-Analysis Data

As a guide to the determination and regulation of production costs, your next purchase of steam-consuming machinery should be influenced in large part by accurate data on the amount of steam used by that type of equipment.

And the facts and figures on steam consumption by department and by each process, must also be known, if a cost-finding system is to operate satisfactorily.

These figures are recorded in graphic, permanent form by the Republic Flow Meter. One of these meters on each boiler shows the amount of steam produced per pound of coal consumed—prevents overloading one boiler while another lags. Do you want more information on this system? Then ask for the free bulletin "Power Plant Cost Accounting."

Congress Guests

It is consistently the policy of the Congress to provide everything that guests desire. In common they want comfortable, economical service. Individually they enjoy the many niceties of attention for which the Congress is famous.

Year after year, season after season, the same people return. It is an exhilarating pleasure to see these persons—many of them men and women of renown—coming back. There is no surer proof of their satisfaction with Congress accommodations.

Not For Fair Play

SOME cross firing has been observed by those interested in business organizations between the Illinois Manufacturers' Association and the Chamber of Commerce of the United States of America in reference to the dates of meetings which have been called by both organizations. The Chamber has something of a reputation for getting on the toes of other organizations, and it seems to have struck a snag in this particular instance.

As early as July 28, 1923, it was publicly announced in practically all the leading newspapers of the United States that the Illinois Manufacturers' Association had under consideration the matter of calling a Farmer-Manufacturer Convention to discuss the problems these two industries have in common and to combat radicalism. The Committee, which was composed of farmers and manufacturers, called the Convention for January 14 and 15. The call was issued on November 22, 1923.

Ten months ago the Chamber of Commerce of the United States of America created five special committees on transportation as follows: "Governmental Relations to Transportation"; "Railroad Consolidations"; "Readjustment of Relative Freight Rate Schedules"; "Relation of Highways and Motor Transport to Other Transportation Agencies"; and "Development of Waterways and Co-ordination of Rail and Waterway Service." These committees were appointed to study the phases of the transportation question each was assigned, and make recommendations. On December 27, the executive officers of the Chamber issued a call for a convention of manufacturers, farmers, bankers and others for Washington, January 9, 10, and 11 to which these committees are to report.

Those having charge of the Convention called for January 14 and 15 thought it was very strange that the Chamber could find no other dates than January 9 to 11, just three days previous to the convention called by the Illinois Manufacturers' Association.

Strenuous efforts were made to induce the Chamber to postpone its conference so that it would not conflict or compete with the more important meeting held in the Middle West, where the farmers live.

The policy of the Chamber has not always been in accord with the manufacturing interests of the United States. There are very few associations of manufacturers that co-operate with it and it has been rather indifferent to the interests of manufacturers.

One would think that if it cared for its constituent members it would be more than willing to co-operate with the Illinois Manufacturers' Association, but it does not seem to be impressed with the good old Anglo-Saxon spirit of fair play.

The Primary

MEN who have money invested in industry and commercial projects are beginning to see the weakness of the primary system in selecting candidates for office. Many are of the opinion that the present method of choosing has more disadvantages than the old system of town meetings.

The primary should be used to select delegates to the conventions and the conventions should name the candidates. It is the opinion of MANUFACTURERS NEWS that, inasmuch as political parties are voluntary organizations, it is unconstitutional to use the taxpayers' money to assist in maintaining them.

The state has no more authority, in our judgment, to pay the costs of running the Democratic or the Republican party than it has to pay the expenses of conducting the Presbyterian Church. The primary is a matter of convenience and not a necessity.

Most business men would like to have a system by which politics could be kept clean without their putting forth any effort, but that is impossible.

Immigrants Needed by the Farmer

SOME people, including some manufacturers, think there are enough aliens in this country now and favor restrictive immigration. They do not seem to realize that the prosperity of the United States has largely been based upon the new blood, energy and progressive intelligence of men from overseas.

Not long ago MANUFACTURERS NEWS called attention to the late Dr. Steinmetz (immigrant), the famous electrical consulting engineer of the General Electric Company. We also have Secretary of Labor Davis, who immigrated from Wales some years back, but does not favor further immigration now that he is here; also Samuel Gompers, another illustrious immigrant.

What we started to do, however, was to make a few comments on a recent editorial in *Manufacturers Record* of Baltimore, Maryland. This editorial states that the Smokeless Coal Association recently passed resolutions to the effect that there is insufficient labor in the country to maintain mining and other essential industries. *Manufacturers Record* stated it is opposed to such resolutions, on the ground that there are too many men engaged in coal mining at the present time. The position is taken, however, that while there are enough coal miners in the country at the present time, and in fact about 200,000 too many, there is not enough labor for other purposes.

MANUFACTURERS NEWS agrees with this position. One of the uneconomic features of coal mining is due to the fact that there are about 200,000 more miners than are actually needed to produce coal. These miners work two or three days a week and expect enough pay to keep them comfortable the rest of the time. Naturally, the public has to pay too much for coal. If these surplus coal miners could be diverted to farming or other lines of work, it would relieve the situation; but, apparently, it is not customary for them to engage in other lines to any extent.

The principal sufferers from the restrictive immigration policy of the United States are the farmers. They are unable to get help, particularly in the South, and when they can hire men they are obliged to pay exorbitant wages for incompetent service.

Increasing Number of Street Accidents

THERE has been much misleading information circulated about the prevalence of industrial accidents in this country. The truth is industrial accidents, as MANUFACTURERS NEWS always has contended, are much fewer in number than automobile and other street accidents and even ordinary falls. Our position, we are pleased to note, has been substantiated by the report of the Committee on Public Accident Statistics of the National Safety Council for the year 1922. During 1922, according to this Committee, there were 75,300 fatal accidents in continental United States, an increase of about 2,000 over the year 1921.

The Committee estimates that each day during 1922, 206 American citizens were killed by accident. Of this daily number, thirty-eight are automobile accident fatalities; thirty-five are caused by falls; nineteen by drownings; sixteen by burns; nine by machinery accidents; five by street-car accidents and the remainder by a varied assortment of special hazards. Each week there are more than 1,400 fatal accidents. The automobile takes a weekly toll of 266 of our fellow citizens; falls are responsible for a weekly average of 245 accidents: drownings for 134 and burns for 115. Street-car accidents take a weekly toll of thirty-four lives on the average throughout the year.

American factories are doing their part in preventing accidents. They have their Safety First committees and every workman is carefully instructed in measures to be taken for his personal safety. The Illinois Manufacturers' Mutual Casualty Association, Incorporated, has a lecturer on accident prevention in the person of Captain G. R. C. Fisher, who is continually talking to the workmen.

When civic organizations take the same trouble for safety in the streets, fatalities from automobiles and similar accidents will be greatly reduced.

How to Get Taxes Reduced

MANUFACTURERS who think taxes are too high for themselves, their stockholders and their employes, should write to their members in Congress favoring the Mellon Tax Reduction Plan. They might profitably follow the example of F. Edson White, President of Armour & Company, who has addressed a letter to Armour stockholders explaining the reductions and the benefit they would be to business and the country in general. Lower taxes will be in the interest of everyone.

Earthquake Aids Business in Japan

Many Leading Industries Stimulated by Curtailment of Supply—Actual Economic Loss Relatively Small

By F. R. ELDRIDGE
Chief, Far Eastern Division,
U. S. Bureau of Foreign and
Domestic Commerce

JAPAN'S financial position is strong, and her economic position has not been seriously affected by the recent earthquake. With the surplus gold in New York, over and above the fully protected note issue, Japan can finance her immediate emergency needs. This gold now totals $134,000,000. If the Diet, which reconvened on December 10 to adopt a plan for reconstruction, decides on a long-time financing plan on the basis of domestic loans, Japan may be able to carry out a plan on a long-time basis without recourse to foreign loans. This seems to be the plan favored by Japanese officials, and is likely to be adopted.

The $134,000,000 of gold in New York was ear-marked to take up the two issues of 4½ per cent Government bonds which come due in 1925. If the long-time policy is adopted, refinancing of these issues would probably be less expensive to the Japanese Government than the floating of a new issue for reconstruction purposes.

While the material loss which Japan has suffered as a result of the earthquake can probably never be accurately estimated, the actual economic loss to Japan is relatively small. Approximately three-fourths of the estimated damage was destruction of buildings and furniture and manufactured goods of distinctly Japanese type. We all know that 80 per cent of any building cost is labor. In addition to this, a large percentage of the new furniture and new stocks of manufactured goods will be supplied by Japanese labor. Strictly speaking, there is no economic loss to Japan involved in this process. The only actual loss to Japan will be the amount of money which will have to be spent abroad for material for reconstruction purposes, less the amount of profit that might have been made by the industries destroyed. What relation this bears to the theoretical material loss is unknown, but it is very much less.

Earthquake Aids Japan's Business

Many of Japan's leading industries have experienced a stimulus from the earthquake. Eight per cent of the silk supply for the year 1923-24, ending next July, was destroyed. As a result of this curtailment of supply, with no curtailment in demand, the price of raw silk has advanced as much as 25 per cent. Assuming that the sale value of the 20,000 bales of silk lost in the earthquake was $20,000,000, it can be readily seen that the increased price for the remaining 300,000 bales to be shipped this year, at $250 per bale, will not only offset this loss, but give Japan a net gain of $55,000,000.

Before the earthquake, Japan's 4,200,000 cotton spindles were running at 80 per cent capacity. Approximately 400,000 spindles, or 10 per cent of the total spindles, have been definitely put out of commission. While it is true that some of the

Proper Analysis of Selling Expense

Various Charts Used In Apportioning Departmental Costs—Highly Centralized System Is Told In Detail

By THOMAS J. NEVINS

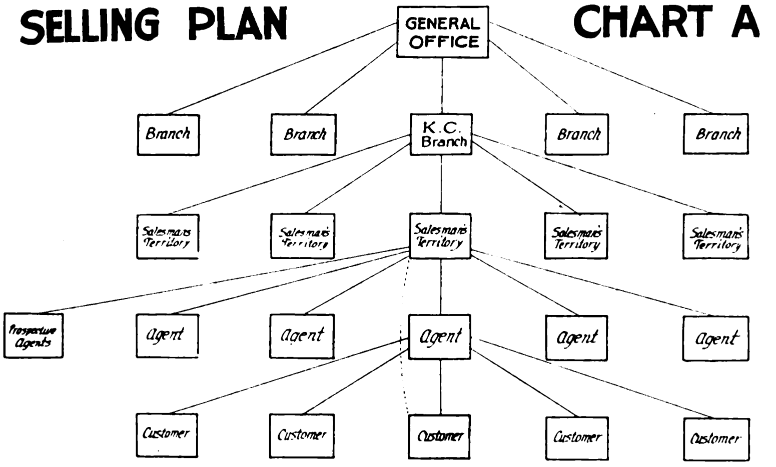
Vice-President, Miller, Franklin, Basset & Company

THIS is the second and final installment of the address delivered by Mr. Nevins before the noon-day meeting of the Illinois Manufacturers' Costs Association on Tuesday, Dec. 18, at the Hotel LaSalle, Chicago.

II.

THE sample set of forms which I here show you were developed for a manufacturer who maintains branch offices, selling through salesmen to the retailers. Each branch operates a warehouse, bills all of its sales and keeps its own customers' ledger. The executive personnel consists of a Branch Manager who supervises the selling activities of the salesmen, and an Assistant Branch Manager who supervises the warehouse and the office.

Now, I want to show you these forms that I have developed. The first one is a simplified chart. I have studied its sales through branch offices. What happened was this: We have our general office, which concerns itself largely in this instance with the manufacture, leaving the selling to be done through the branch offices. It has one executive, who makes a circuit of the branch offices, and is responsible for them. There are various branches. I have shown five here; the exact number does not matter. We are going to talk about one of those branches. Now, that branch has salesmen; I have shown five here. Each salesman has a certain territory. Within that territory are agents, who are the retailers. This product is sold to builders, building contractors, and people of that sort, who buy a large quantity of it; and, therefore, it has customers who buy through the retailers.



SELLING PLAN CHART A

The salesman must sell his agents, and he must also call on the larger customers that his agent has, to stimulate the demand for the product, and uphold the agent's campaign; and he must also call on prospective agents, and people who might handle the line, because every time they add a new agent, they eliminate a good concern that sells their competitor stuff.

Office Expense Analysis

Summarizing this, what we do here is: First, we make an analysis of the expense of this branch office, putting in all items that seem proper; and then out of this analysis we develop a basis for dividing that expense over the sales between salesmen. Then we do the same thing with the salesman's territory. We find a basis for dividing the sales expense. Then we take the agents, and we find out by analysis of an agent's account whether it is profitable or otherwise, and then we work back further and find whether the branch is profitable or otherwise. That is the thing we are trying to show by these charts.

This, you see, is the analysis of the branch houses. What we put down on this analysis is simply the items which seem proper to put down. It is proper to say that each of those branches operated its own warehouse, and had its own customer's ledger, and did its own billing; so we put down the expense under branch expense. Then we have found the cost per item billed, which seems to be the proper basis for allocating that expense.

On Form 1 is listed the cost of warehousing, billing and bookkeeping, in order that a cost per item may be developed. Note that this actual cost per item is compared with a normal, and a gain or loss determined, just as is present good practice in costing the manufacturing. A fluctuation above normal warns the Branch Manager that something is wrong. That gives us a specific mark to shoot at every month, developing the normal or budget cost, or whatever it may be called.

Now, on Form 2, the same thing. We have this for each of the salesmen. We have two of the salesmen on this form. We have salary expense, manager's supplies, numbers of calls made, actual cost per call, normal cost per call, etc. The point of including two salesmen on the one sheet instead of giving each salesman the honor of a sheet to himself, is to make it appear that there may be a different normal cost per call. The normal cost per call is going to depend on the density of population, the number of agents, the extent to which the territory has been infiltrated, and all that sort of thing; and then there is the distance he has to travel; salary, expense, share of management—that is the share of the Branch Manager's salary, the General Office Manager who supervises all this.

Branch Manager's Salary

On Form 2, the cost of each salesman is developed. All of the items are self-explanatory except perhaps "share of management." That is the share of the Branch Manager's salary. That could be divided in a great many different ways. The proper way to divide it is the proper way. That is really the only way to put it. You must find out how he divides his time, and divide his expense as he divides his time. His work in this instance is supervisory. Since his work is supervisory, it can be assumed, in this concern at least, that each salesman receives the same amount of supervision. The total cost is divided by the number of calls made to give an actual cost per call. This is compared with the normal cost and the total gain or loss from normal due to activity of the salesman is determined.

These salesmen call on three classes of people. "Agents" are those retailers now handling the product. "Customers" are contractors and architects who buy in considerable quantities from the agents. "Calls for promotion" are made on retailers who do not handle the product, in the hope of selling them and thus making them "agents." This is just a little form which we put in, on the cost per call.

The calls on each class are costed at normal to give a line on the kind of effort each salesman puts forth. That enables us, you see, with the normal cost, to find out what proportion is chargeable against each of the three classes of solicitation which must be made. A little experience shows for each territory about how many calls a salesman should make on each class. Some salesmen incline to call only on the agents who already handle the line and do not aid their agents with sufficient calls on the agents' customers. Another man is apt to be so keen on selling new accounts that he neglects his agents and loses old agents as rapidly as he sells new ones. This form gives the Manager a quick view of these conditions.

For convenience sake, the daily reports of all salesmen are summarized on Form 3. That is merely informatory data of the number of calls a salesman has made.

Now we get Form 4. To give a line on whether an agent is profitable or not, the cost of selling him and the profit made on him is balanced on Form 4. The charges to him are self-evident but it is worth noting that the normal cost per call is different for each territory. This is due to density of population and facilities for traveling.

Analyze Unprofitable Agent

When an agent shows unprofitable, it is desirable to analyze his account more in detail. As it stands, it shows whether he is being called on too often; whether, considering his purchase, he gets too much advertising; or, perhaps, that if he got more advertising help he would sell more goods.

If still further analysis seems desirable, it is easy to turn to the invoices of goods sold to the agent and find out why the profit is too low. Perhaps he buys only narrow margin goods; perhaps he buys in too small quantities. In either event, the facts developed by the analysis will indicate what steps to take. Of course, the detail of the agent's purchases might be shown on Form 4, but with several hundred agents that would entail a large amount of clerical effort, much of which would be needless. We are interested in the detail of only those accounts which do not show a proper profit. Therefore, it is best to keep clerical effort to a minimum and look into details only when needed.

You see we use here our normal cost per call. We compare our actual cost per call on the preceding report with the normal cost per call. Here we use the normal in finding whether an agent is profitable or not. We put down all expenses chargeable against the sale, the calls made on him, the advertising we do in his behalf, and the billing cost at so much per item, normal cost for the first item. We then develop a movement here which represents what it has cost us to sell that account, to hold that account. Then we put down the amount of sales, and our cost of goods sold.

You can see the cost of goods sold, plus cost of selling, is equal to the amount we have taken in. In other words, there is a loss on that account of $60.36, and a gain on this other account, similarly, of $190.42—thus developing whether each agent is profitable or not.

On Form 5 we work back to the salesman, summarizing for each salesman in the territory the agents the man has, finding out whether the salesman on his territory as a whole gains or loses. Here we have the territory, and it is merely necessary to summarize the information that we bring over from this preceding form, in order to get this information. Gain is profit. That is the significance of gain; the profit made on the different individuals leaves us our net profit on the territory of $1,100.55, which is 16.4 per cent in that instance; the second territory examined has a profitability of 14.6.

The figures developed in the agents' accounts on Form 4 are summarized on Form 5 to give the gain or loss on agents by territories. The percentage of profit on sales may also be determined, to show which salesmen are most profitable.

These territorial gains or losses are again summarized on Form 6 to give the gain or loss for the branch office. Here we have, you see, the same sort of report. We have the branch office, and at the general office we can assemble these data and find just what all of our branch offices are doing. In that way we have a line on what branch offices are profitable, and what branch offices are unprofitable, and we also have our analysis extended to show us why in each case they are profitable or unprofitable.

Form 7, for our guidance, covers the branch office promotion. We have a summary of the information brought forward from the preceding form. That is to say, we have the total direct selling expense for the branch, which is what has already been summarized, and we have the billing and warehousing expense, the total branch office expense. That gives the percentage of branch office expense to sales.

Two Big Speakers at I. M. A. Annual Dinner

DR. NICHOLAS MURRAY BUTLER, President of Columbia University, New York, and New York's candidate for the Republican nomination for President in 1920, has accepted an invitation to deliver an address at the annual dinner of the Illinois Manufacturers' Association on the evening of Jan. 15, 1924, at the Congress Hotel, Chicago. His subject will be "Nation Building—For Peace or War?"

Hon. Cleveland A. Newton, member of Congress from St. Louis, also will speak, his subject being "Waterways of Illinois and the Nation."

Determining Cost of Selling

In setting up these statements, you may have noted that the branch was not charged with a share of the home office administrative and general sales expense. It should be, but conditions in this concern were such that it was decided not to. After all, what I am describing in this paper is the method of determining the cost of selling in such a way as to enable the selling effort to be intelligently directed. I do not purpose to enter into a discussion of the method of distributing these items justly to the various territories because the basis will be different for nearly every business. But I do want to point out that those who now attempt it usually do it wrong. The ratio which the sales of a territory bear to the total sales is seldom the correct way to determine the share of the general sales expenses.

In the concern where the general sales work is highly centralized in the home office, instead of scattered among branches, as in the one I have just described, it may be well to departmentalize the selling activities just as we commonly do the factory in gathering manufacturing costs. So, to gather these expenses, we consider each separate selling activity as a department, and call the sales districts the "productive department" and the general activities "contributory departments." The aim is ultimately to get all of the contributory department expense charged in proper proportion to the various sales districts.

In one concern whose analysis I set up, it seemed necessary to have seven contributory departments: (1) office upkeep; (2) executive; (3) credit department; (4) order department; (5) billing department; (6) cashier and accounting; (7) general handling and sales.

The office upkeep and the office rent are distributed both to the sales districts and to the other contributory departments on the basis of the area occupied by each department. In addition, each contributory department and sales district is charged with depreciation of the furniture and equipment actually used by it.

In order to spread the general executive expense, we occasionally asked the chief executives to keep an informal record of the time put in by them in supervising the various territories and other selling activities of the business. Ordinarily, they would keep notes for a period of a month or so, which would give us a very fair line on the proportion in which they spread their activities over the selling sides of the business.

At first thought, it may seem that the total expense involved for credits and collections is fairly measured by the amount of sales in dollars of the various territories. I feel, however, that it is not at all a fair method, for those year-in-and-year-out customers whose purchases run into large figures are seldom the subjects of much activity on the part of the Credit and Collection Departments. It is the small buyer, who is often of uncertain credit standing from month to month, and the new accounts, which require a Credit Department.

Usually, I believe the most nearly accurate method is to make each account bear the same amount of the credit expense.

Credit Department Costs

Thus, if a concern does business with a hundred merchants and has a total credit expense of $10,000 a year, the cost per account would be $100 a year. A sales territory in which there were ten customers would, therefore, be charged with $1,000 a year for the Credit Department, and one of fifteen customers with $1,500 a year. Admittedly, this method of division is not universal, and it is entirely possible that certain concerns would find that the dollar of sales was the most accurate measure by which to distribute the cost of the Credit Department.

I have already shown that the cost of

handling, billing and accounting for an order should be per item. The inaccuracy of distributing the expense of these departments in proportion to the volume of business in dollars should be evident, for we may have a New York district selling to very large buyers, who place large and easily handled orders, and in the West we may have a great many buyers. The small buyer may give us an order amounting to only $100, but made up of a dozen or more items, while a large New York buyer may give us an order consisting of a single item amounting to thousands of dollars. Obviously the volume of work in these three clerical departments is dependent, not upon the size of the orders in dollars, but upon the number of items on the orders. It is no more difficult to enter, bill and account for an item of $1,000 than for an item of $10. Therefore, at the end of the month, when the total expense of operating these departments has been determined, we divide it by the total number of items, or perhaps of sales book folio pages handled, and this develops a cost of handling per item or per page of billing. Then, for each sales district, the total number of items or of pages of bills which went out to that district is multiplied by this unit price and the district charged accordingly.

You may say that it is not the fault of the Western territory that it must sell to small dealers who order many items at a time, nor is the New York district to be praised for turning in orders of few items but many dollars. The fact remains that so far as the clerical effort is concerned, it costs more to sell in the Western territory than in the New York territory, and it is that which we wish to know.

The General Sales Department will include the salary and expenses of the General Sales Manager, his stenographer and perhaps of a Sales Promotion Department. The manner of distributing this expense to the territories will, however, depend upon just what the activities of the Sales Manager are. If, as is sometimes true, his principal duties are supervising the salesmen, stimulating them by letters, criticising their expense accounts and in general being merely a manager of men, it seems best to make the number of salesmen in a territory the measure of how much of this department's expense each territory shall carry. In other words, with a general sales expense of $20,000 a year, with a total of 400 salesmen, a district containing ten salesmen would obviously have to bear $500 a year of the general sales expense.

If, however, the Sales Manager gives his principal effort to outlining sales policies and solving sales problems as they develop, and is only incidentally a manager of salesmen it is best to record the time spent by the Sales Manager on each territory and make this the basis for distributing the expense of his department.

Spreading Advertising Expense

If considerable national advertising is done, there is need for careful thought in distributing the expense among the territories, but the benefits to be gained are tremendous in dictating the most effective advertising policy.

Newspaper advertising is charged to the district in which it is used.

It is not feasible to describe all of the factors that govern the share of national advertising chargeable to each territory; but, besides the circulation of the magazines, consideration must be given to the number of possible buyers in each territory, and many other things. Here each business presents an individual problem.

It may seem to analyze selling expenses in this way entails an amount of clerical expense which, in a small business, the benefits would not warrant. In the first place, the added work of maintaining such an analysis is more apparent than real. In most concerns it need only take a few hours' time per month of the bookkeeper, who is needed anyway. There are no figures required which are not already available from any properly conducted accounting system. They are merely re-grouped to give new information.

And this new information will be as valuable to most concerns as any they can get, for selling expense is one of the largest items which must be deducted from profits. Not infrequently, it is as large as all of the other overhead expense of a business. But it has never been scrutinized as carefully as factory or general overhead. Non-productive expense is always watched closely to see that it justifies itself in the returns it gives, and it is commonly the first item to be cut out when economy is wanted.

But selling expense has been thought of in the lump, and is usually approached with the paring knife timidly because, perhaps, selling is an intangible, mysterious activity to many men. It is usual to think of any sale as a good sale, any salesman who makes large sales as a good salesman and any advertising that mentions the concern's name and product as good advertising. At least, even though there may be a hazy idea that some selling efforts are better than others, there has been no measure evident.

Such an analysis of selling expense as I have briefly described furnishes the measure. It shows which salesmen and which collateral selling effort produces results and why. It enables the executive to weed out the uneconomical with accuracy. It makes it unlikely that worth-while activity will be discontinued just because it happens to loom large in dollars.

Illinois Coal Operators Ask Cut in Miner's Wage

Illinois coal operators, at a recent meeting in Chicago, voiced a demand for a reduction in the pay of miners in the bituminous fields. This demand will be presented to the United Mine Workers, which will meet at Indianapolis on Jan. 22. The Illinois operators also decided to join with operators from Indiana, Ohio and Western Pennsylvania in trying to effect a joint agreement for what the trade knows as the "Central Competitive Field."

Panama Canal Competition With Mid-West In Figures

That Panama Canal competition is "a condition, not a theory," as expressed by Charles Donnelly, President of the Northern Pacific Railroad, and that this coast-to-coast competition offers a serious problem for shippers of the Middle West, is substantiated by the following analysis of the traffic passing through the Panama Canal during the fiscal years 1922 and 1923, says *Trade and Transportation Bulletin.* Unless relief is granted to the carriers serving the Middle West, either the markets of the interior will have to forego a large share of this traffic or the carriers serving them must seriously shrink their total revenue by a reduction in rates to all intermediate points as well as to the coast cities.

Traffic passing through the Panama Canal during the fiscal year 1923 has been analyzed and tabulated with the following result:

Atlantic to Pacific

Origin:
71.0%—East coast of U. S.
20.7%—United Kingdom and Europe.

Destination:
45.3%—West coast of U. S.
26.7%—Far East.
15.1%—West coast of S. A.

Pacific to Atlantic

Origin:
59.7%—West coast of U. S.
26.6%—West coast of S. A.
4.8%—West coast of Canada.

Destination:
64.5%—Eastern and Gulf Seaboard of U. S.
28.2%—United Kingdom and Europe.

Commodities which aggregated more than 100,000 tons are listed below:

Atlantic to Pacific

Commodity	Fiscal Year 1923	Fiscal Year 1922
Cement	113,726	48,301
Coal and coke	280,343	404,389
Cotton	122,728	198,684
Manufactured goods		
Iron and steel	1,499,842	1,068,361
Machinery	153,031	88,731
Railroad material	173,259	139,428
Textiles and other	193,458	106,891
Metals, various	270,703	165,104
Oils, various	1,065,184	988,829
Sulphur	117,084	100,449
Sugar	38,635	155,409

Commodities which aggregated more than 100,000 tons are listed below:

Pacific to Atlantic

Commodity	Fiscal Year 1923	Fiscal Year 1922
Barley	379,542	418,234
Canned goods (fish, fruit, vegetables, etc.)	489,461	344,621
Lumber	1,539,340	720,622
Metals, various	347,715	179,582
Nitrate	1,664,751	470,796
Oils, various	4,388,909	296,394
Ores, various	712,681	156,136
Sugar	296,471	257,967
Wheat	816,392	804,736
Wool	106,111	148,103
Flour	66,833	130,217
Food products in cold storage	106,058	193,586

Real Estate Men to Meet

The National Committee of the National Association of Real Estate Boards will meet in Augusta, Ga., on Jan. 17 to 19 inclusive. Officers and directors of the Association for 1924 will assume their new duties at that time. H. R. Ennis, of Kansas City, is the new president.

Armed Truce In Bonus and Tax War

House Advocates of Conflicting Measures Awaiting Developments; Gen. Dawes' Appointment Proves Popular

By JOHN M. TOWNSEND

Washington Correspondent, Manufacturers News

Washington, D. C., Jan. 2—Political lines in Congress are being solidified during the holidays preparatory to a lively parliamentary battle over taxation, the bonus, railroads, and farm relief legislation throughout the balance of the session. When Congress reconvenes, the House will undertake a revision of its rules before proceeding to legislative business other than appropriation bills; but in the meantime the House Ways and Means Committee is paving the way to financial legislation and the Interstate Commerce Committee is working on the railroad problem. Extended hearings and consideration will be necessary before any of this legislation reaches the floor of the House.

TAX AND BONUS LEGISLATION—While the lines on tax legislation are tightening to the extent that the Democrats have now publicly expressed their readiness to support the Mellon Tax Reduction Plan in principle, and the lines on bonus legislation have been so sharply drawn that Senator Smoot now believes the Senate will fail to overturn a presidential veto on a bonus bill by a margin of two votes, nevertheless the whole situation affecting both of these measures is such as to make it impossible at this time to forecast definitely the details of the measures which will be presented for consideration. Furthermore, the conditions are so unsatisfactory and the state of mind in Congress so varied as to make it certain that a host of amendments will be offered for both bills on the floor of both the Senate and the House when they come up. As matters now stand, the House Ways and Means Committee has under consideration merely the administrative features of the tax bill, with an understanding that on Jan. 10 it may again take up the question as to whether or not a bonus bill is to take precedence over a determination of the tax rates to be carried in the tax reduction measure. In other words, the present arrangement is a form of armed truce between the bonus advocates and tax reduction advocates in the House, with the real issue to be determined at some later date.

HOOVER AS BUSINESS PROPHET—Secretary of Commerce Herbert Hoover regards the economic outlook for the United States for the next year as bright, and the outlook for the world in general as hopeful during the coming year. While the balance of the world has been making steady progress toward a recovery since the war, Europe is still suffering from the Ruhr invasion with its ramifications and the failure of the Allied Powers and Germany to come to any agreement on reparations. This condition has produced unbalanced governmental budgets, inflation, unemployment and a falling off in buying power which has especially affected the nations most interested and has indirectly affected the United States. Now that new conferences have been called to consider the European problem, Secretary Hoover is hopeful that conditions there may shortly show progress, and that an improvement will continue and eventually become permanent. So far as this country is concerned, productivity, employment, wages, savings, construction, and increased facilities have attained in 1923 the highest figures since the war, and the absence of speculation, overstocking, and inflation has been encouraging. Foreign trade for the year will show a favorable balance of $300,000,000, liquidated almost entirely by the importation into this country of $260,000,000 of gold and silver. With tax reduction in sight, Secretary Hoover has no hesitancy in predicting that "the odds are favorable for 1924."

McLaughlin, Michigan; Frank Crowther, New York; Clayton Morris, Committee Clerk (standing, left); Wm. B. Green, Iowa, Chairman (standing, center); H. T. Rainey, Illinois; J. W. Collier, Mississippi; J. N. Garner, Texas; W. P. Martin, Louisiana; A. W. Gregg, Assistant Secretary of the Treasury (standing, right); C. C. Dickinson, Missouri; Cordell Hull, Tennessee; W. A. Oldfield, Arkansas; C. R. Chindblom, Illinois; H. H. Watson, Pennsylvania; L. H. Hadley, Washington; G. M. Young, North Dakota; W. C. Hawley, Oregon.

PUBLIC VERSUS PRIVATE RIGHTS—The Senate Committee now investigating government oil leases on Naval reserves to private oil corporations has again raised the question as to the extent to which a congressional body can go in prying into the private affairs of citizens. This issue was raised last Spring by the LaFollette Investigating Committee which sought to learn from Harry F. Sinclair the details of the making of his lease with the Government for the Teapot Dome Reserve; and then, going a step further, sought to learn what Mr. Sinclair had done with the stock he received from the holding corporation organized to carry out the terms of the lease. Mr. Sinclair was entirely frank with the Committee relative to all transactions leading up to his procurement of the lease and of the lease itself, but he drew the line against discussing with the Committee the details of the private transactions of himself and his associates in the matter of disposing of his securities. As a matter of fact, Mr. Sinclair furnished the Committee with evidence that he, personally, owned a large majority of the outstanding stock in the operating corporation at Teapot Dome and he had testified before the present Committee that he still owned that controlling interest. He is also operating under the Government lease to the satisfaction of the Government, and has furnished evidence to that effect. The principle for which he is now contending, and concerning which more will be heard as the investigation proceeds, is the right of an Investigating Committee to go beyond the scope set forth in its appointment and investigate his private affairs, as well as to require him to testify regarding the private

421637

affairs of his associates. This issue has been raised by congressional committees repeatedly, in the past, without getting anywhere except to make business men who go into partnership with the Government in anything decide once for all that one experience is enough. Mr. Sinclair appeared twice before the LaFollette Committee and five times before the present Committee, which, so far as he is concerned, appears to be engaged in a political "fishing" expedition, pure and simple.

RUSSIA—Those members of Congress headed by Senator Borah, of Idaho, and Representative Frear, of Wisconsin, who want the United States Government to recognize Russia, are to have an opportunity to develop their case before a Congressional Investigation Committee which will probably be appointed by the Senate, with Senator Borah in charge, to hold a public hearing on the subject. If the Committee is able to make out a case favorable to recognition, it is proposed that the decision shall be made the basis for a resolution of the Senate, advising the President that the Senate thinks the time for recognition has arrived. This proposition, however, is not as easy for the friends of recognition as it would appear from this simple statement of the situation. President Coolidge and Secretary of State Hughes have clearly enunciated their opposition to recognition until such time as Russia recognizes the sanctity of contract, both governmental and private, recognition of the legitimate foreign debts of Russia, and ends for all time the secret propaganda being carried out by organizations within Russia clearly allied with the Soviet Government, which has for its purpose the breakdown of the institutions of outside governments. There is evidence that, after Senator Borah and his associates have produced all the evidence they have favorable to Russian recognition, the Administration will furnish the Investigating Committee with facts known to it which bear on the issue before the Committee. Whether or not Secretary of State Hughes, or the officers of the Department of Justice, cognizant of the activities of Russian propagandists in this country, will appear as witnesses, will be determined later. In any event, those who wish to talk about Russian recognition will have ample opportunity to air their views.

INTERNATIONAL CONFERENCES—The definite selection of General Charles G. Dawes, of Chicago, Olin H. Young, of New York, and Charles Robinson, of Los Angeles, as the American citizens who will unofficially represent the United States in the coming European conferences to stabilize German finances and currency, has apparently met with general approval, not only in Washington but throughout the country. General Dawes' wide experience as a banker, government budget officer, and as finance officer of the Army in France during the war, has caused his abilities to be rated so highly abroad that he will doubtless be officially tendered the Chairmanship of the General Committee on the German budget. All of the American selections are bankers who have the confidence of the sections of the country which they represent, and, inasmuch as any European agreement affecting reparations must satisfy American financial interests which will be called upon to help finance any decision reached, the importance of their work is apparent.

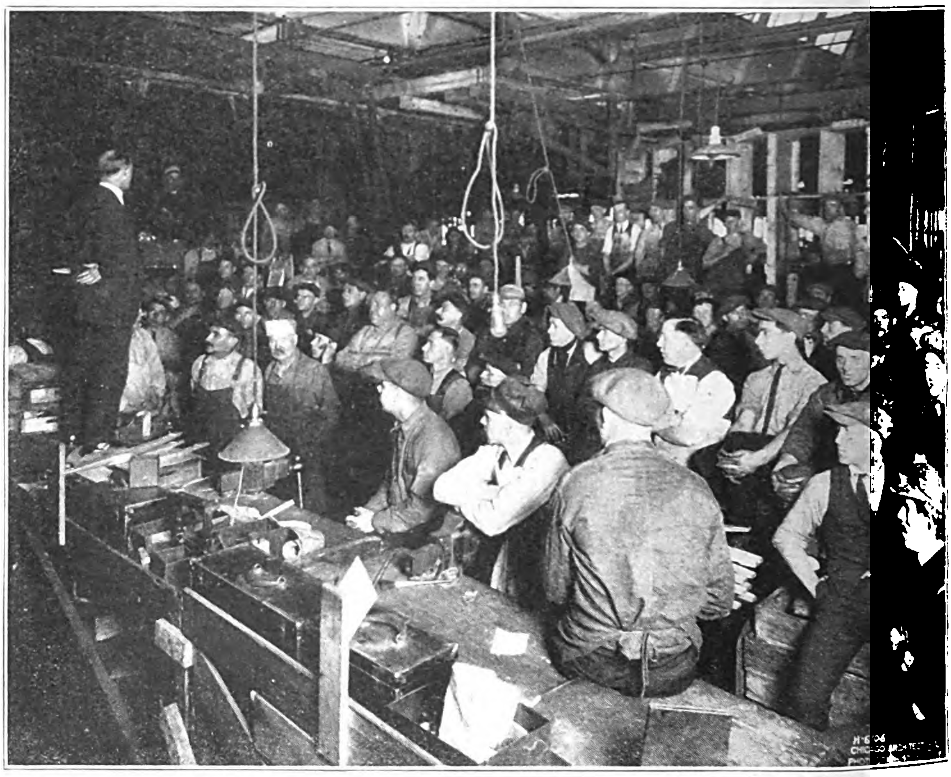
Safety and Accident Prevention Work By I. M. M. C. A. Approved by Employers

PARTICULAR emphasis is being laid upon safety and accident prevention in manufacturing plants by the Illinois Manufacturers' Mutual Casualty Association through a course of lectures given employes and executives under the direction of the Association.

Capt. G. R. C. Fisher, of the Inspection and Safety Department of the Association, is the specialist through whom the work is being done and who is conducting the campaign. The accompanying photograph is a fine illustration of this work among the policy holders of the Association. The splendid group of workmen shown in the illustration are employes of the Delta Star Electric Company and, through the courtesy of Allen S. Pearl, the Secretary-Treasurer, Capt. Fisher has had the privilege of holding five such meetings of twenty-five minutes each on Company time. No little cost to the Company, but, as Mr. Pearl expressed it, "it pays."

At the moment when this photograph was taken Capt. Fisher was "hewing to the line" on their own recent accident reports dealing particularly with the question of eye injuries. The attention which the men are paying to the speaker is quite marked and little wonder since they are hearing some startling facts from medical science as to what eye accidents really mean. This is what the Captain is telling them:

"Any injury to the surface of the body, if conditions are right, will not only heal, but nature will actually restore any tissue which was destroyed. But if one suffers an injury to the pupil of the eye, even though the scar will heal, *yet every such healed spot is for all time a blot on the vision.* Men, suppose one suffers many such injuries, can't you imagine just what that means? What is the moral to draw from this startling fact? Need I tell you? Now, then, it is up to you to see to it that you suffer no such injuries."



"HEWING TO THE LINE" ON ACCIDENT PREVENTION
Capt. Fisher, (Standing on Bench, at left) Addressing Employes of the Delta Star Electric Company

To Celebrate Cigar Anniversary

The Tobacco Industries Exposition will be held in New York Jan. 28 to Feb. 2 inclusive, and one of the principal events on the program will be the 125th anniversary of the making of the first American cigar, which was produced by a woman, Mrs. Prout, of Windsor, Conn. The first experimental cigar, it is said, was made by her in 1799, and the cigar as it is known today was put on the market in 1801. Since then the output has increased to more than 10,000,000,000 per year.

"Conjunction" Key to R. R. Service

Co-ordination and Alignment to Produce Competitive Through Lines, Should Be Dominating Regrouping Plan

FOR some time past the Interstate Commerce Commission and executive officers of the leading transportation systems of the country have been trying to find some way to increase the efficiency of management of the great railroads of the United States. Numerous hearings have been held and the Commission has formulated a tentative plan for regrouping the lines. There is much discussion of this proposed plan, some railroad men favoring and others opposing it.

The following article, by Samuel Russell, Secretary to United States Senator William H. King of Utah, presents a new phase of the subject that is both interesting and constructive. It was sent to MANUFACTURERS NEWS by Mr. Russell, and its unique plan should prove interesting to readers of this magazine.—Editor's Note.

IT is the conjunction, not the combination, of railroads which holds the key to the accommodation of the railroad traffic requirements of the country. The history of railroad development has shown a constant struggle by the leading systems to extend themselves to important ports and traffic centers. And it is in the application of this principle, that the proper solution of the railroad problem is to be found. Facility of traffic from the interior of the country to the seaports should be the cardinal and controlling factor in the new co-ordination and arrangement of the railroads. No railroad having entry into one of the great ports should be permitted to combine with another railroad having an entry into the same port. The separate lines entering important ports should be brought into conjunction with separate lines which stretch out into the country and originate the freight which moves to the seaboard.

The problem of the short line, local, and feeder railroads, is a secondary problem. They should have the connections permitting the traffic originating on them the greatest facility of movement to its designation, preference in connection being given according to the direction and route of the preponderance of the traffic.

Co-ordination and alignment, in order to produce great competitive and through lines must, therefore, be the dominating principle in the regrouping of the railroads. The plan which has been prepared for the Interstate Commerce Commission, as well as the tentative grouping adopted by the Commission, does not make sufficient application of this properly controlling principle. The Commission Plan is rather one for regional combination, and is not primarily a plan for the conjunction and articulation of lines for more perfect through service to carry the traffic from the great centers of production in the Mississippi and Ohio Valleys to the important ocean ports.

It needs to be emphasized that it is the continental conjunction of railroads, and not the regional combination of railroads, which will alone meet the traffic requirements of the country. Regional combination, such as is proposed and urged in some quarters, will only create local monopolies under the patronage of the Government; whereas, the conjunction of the railroads, end to end, will afford more extensive and competitive service by through routes between the traffic centers and ports of the country. The joining of routes together for this purpose constitutes the only sound transportation policy.

It must be recognized that Chicago is the central railroad terminal of this country. The primary problem, therefore, is to connect Chicago by direct and independent competitive services with the ports of Boston, New York, Philadelphia, Baltimore, Norfolk, Charleston, Savannah, Brunswick, Jacksonville, Pensacola, Mobile, Gulfport, New Orleans, Galveston, San Diego, Los Angeles, San Francisco, Portland, Seattle and Tacoma.

Grouping for Traffic Problem

In the application of this principle, the following grouping of railroads is arranged as a practical accommodation of the traffic problem of the country:—

CHICAGO AND NORTH ATLANTIC PORTS.

1. Chicago to New York:
    - Pere Marquette
    - Lehigh Valley
2. Chicago to New York:
    - Erie
3. Chicago to New York and Boston:
    - New York Central
    - Boston & Albany
4. Chicago and St. Louis to New York:
    - Nickle Plate
    - Clover Leaf
    - Lake Erie & Western
    - Delaware, Lackawanna & Western
5. Chicago and St. Louis to New York, Philadelphia and Baltimore:
    - Baltimore & Ohio
6. Chicago and St. Louis to New York, Philadelphia and Baltimore:
    - Pennsylvania
7. Chicago and St. Louis to New York, Philadelphia and Baltimore:
    - Wabash
    - Philadelphia & Reading
    - Central Railroad of New Jersey
    - Wheeling & Lake Erie
    - Akron, Canton & Youngstown
    - Dayton, Toledo & Chicago
    - Pittsburgh & Lake Erie
    - Western Maryland
    - Buffalo, Rochester & Pittsburgh

(This will create a powerful new trunk line through Youngstown and Williamsport)

CHICAGO, SOUTH ATLANTIC AND GULF PORTS.

8. Chicago to Newport News:
    - Chesapeake & Ohio
    - Hocking Valley (Toledo)
9. Chicago to Norfolk:
    - Chicago, Indianapolis & Louisville (Monon Line)
    - Norfolk & Western
    - Western Ohio (to Toledo)
    - Cincinnati, Indianapolis & Western (to Springfield)
10. Chicago to New Orleans and Southern Ports:
    - Chicago & Eastern Illinois
    - Louisville & Nashville
    - Nashville, Chattanooga & St. Louis
    - Savannah & Atlanta (Savannah)
    - Atlanta, Birmingham & Atlantic (Brunswick)
    - Georgia & Florida
    - Norfolk Southern
    - Piedmont & Northern
    - Tennessee Central
11. Chicago to New Orleans and Southern Ports:
    - Illinois Central
    - Central of Georgia (Savannah)
    - Gulf & Ship Island (Gulfport)
    - Gulf, Mobile & Northern (Mobile)
    - Cotton Belt Route (St. Louis to Ft. Worth)

CHICAGO AND PACIFIC PORTS.

12. Chicago to Los Angeles and San Francisco:
    - Chicago & Alton
    - Frisco Lines
    - Southern Pacific
    - San Diego & Arizona
    - El Paso & South Western
13. Chicago to Los Angeles and San Francisco:
    - Santa Fe
14. Chicago to San Francisco:
    - Chicago, Rock Island & Pacific
    - Denver & Rio Grand Western
    - Western Pacific

(The Rock Island, with terminals in Minneapolis, Chicago, Omaha, Kansas City, St. Louis and Memphis, can sustain and strengthen this languishing but potentially important line to San Francisco)

15. Chicago to San Francisco:
    - Chicago & North Western
    - Union Pacific
    - Central Pacific
    - Kansas City Southern (to Port Arthur)
    - Louisiana Railway & Navigation (to New Orleans)
    - Missouri & North Arkansas (to Memphis)
    - Fort Smith & Western (to Oklahoma City)
16. Chicago to Seattle, Tacoma and Portland:
    - Chicago, Milwaukee & St. Paul
    - Spokane, Portland & Seattle
17. Chicago to Seattle, Tacoma and Portland:
    - Chicago, Burlington & Quincy
    - Northern Pacific
18. Chicago to Seattle, Tacoma and Portland:
    - Minneapolis, St. Paul & Sault Ste. Marie
    - Minneapolis & St. Louis
    - Great Northern

CROSS COUNTRY CONNECTIONS.

19. Washington to Jacksonville and Southern Ports:
    - Atlantic Coast Line
    - Atlanta & West Point
    - Western Railway of Alabama
    - Alabama & Vicksburg

TRANSPORTATION

Government-Owned Railroads of the World Approximate 750,000 Miles—None in U. S., England, or Spain

PUBLISHED reports that certain European countries are considering the advisability of sale of their governmentally owned railways with a view to the utilization of the proceeds for other purposes lend interest to a compilation regarding the railways of the world and the share owned by the respective governments. The total length of the world railways, says the *Trade Record*, according to the latest figures of accepted authorities, now approximates 750,000 miles against about 700,000 miles in 1913, 500,000 in 1900, 400,000 in 1890, 250,000 in 1880, and 25,000 in 1850, these figures being of course in very round terms.

The share of the world's railways owned by governments, according to high authorities of the railroad world, is in 1923 about 35 per cent against approximately 33 per cent in 1913, 28 per cent in 1906 and 24 per cent in 1896.

Governmental ownership, however, differs widely in the various countries and continents. In Europe as a whole about 50 per cent of the railroads are governmentally owned, in South America approximately 33 per cent, in Africa 50 per cent, in Asia 70 per cent, in Australia 90 per cent and in North America, exclusive of the United States, about 49 per cent. In the United States and Great Britain, as is well known, governmental ownership of railways does not exist and this is true also of Spain.

On the other hand, in the newly erected country of Poland all railways are owned by the government, in Germany about 92 per cent, Italy approximately 73 per cent, Belgium 59 per cent and in France about 22 per cent.

Outside of Europe conditions also differ widely. In India, including the native states, the share owned or controlled by the Government is about 85 per cent, Japan 67 per cent, Canada approximately 50 per cent, British South Africa 82 per cent, and British Australasia 98 per cent.

The growth of the world's railways since the beginning of the war is, according to very high authorities in world railway matters, approximately 50,000 miles, the total for 1913 having been, according to that generally accepted German authority, Archiv fur Eisenbahnwesen, 690,133, and for 1920-21, as stated by the 1923 edition of the London Railway Year Book, 747,667, while the known additions made in 1922 and 1923 would apparently justify the assertion that the world total at this time is approximately 750,000 miles against 700,000 at the beginning of the war.

The world's next duty in the matter of railway construction, adds the *Trade Record*, is the construction of railways in the undeveloped sections of the globe, especially the tropical areas having untold producing possibilities but lacking transportation facilities to move their products to the water's edge. The railways in temperate zone United States average 83 miles to each 1,000 square miles of area and in Europe 62 miles of line per 1,000 miles of area; while, on the other hand, South America, chiefly tropical, has but 7 miles of line per 1,000 square miles of area, Asia 4 and Africa 3 miles per thousand.

B. & O. Re-elects Officers

At the meeting of the Board of Directors of the Baltimore & Ohio Railroad Company, held in New York recently, Daniel Willard was re-elected President of the Company, and other executive officers re-elected were as follows: Senior Vice-President, George M. Shriver; Vice-President and Executive Representative in Chicago, F. C. Batchelder; Vice-President, in charge of operation and maintenance, C. W. Galloway; Vice-President, in charge of traffic, Archibald Fries.

C. M. & St. P. Secretary Resigns

E. W. Adams, for twenty years Secretary of the Chicago, Milwaukee & St. Paul Railway, and for twenty-seven years an employe of the road has resigned. In announcing his retirement, Mr. Adams gave as his reason a slight decline in health. He will seek rest and health in Los Angeles, he said. The resignation of Mr. Adams came as a surprise to officers and directors of the road.

C. R. I. & P. Official Dead

Martin A. Patterson, General Freight Agent of the Chicago, Rock Island & Pacific Railway for six years and for forty years an active figure in the railroad world, died recently at Santa Barbara, Cal. Heart disease was given as the cause. He was born at Mackinaw, Ill., 65 years ago, and lived at 10943 Homewood Avenue, Morgan Park.

October Freight Service

Freight cars were handled more expeditiously in October than at any time since the compilation of such records began in 1917, according to reports recently filed by the railroads of the country with the Bureau of Railway Economics. The average daily movement per freight car for the month was 30.7 miles.

Compared with October last year it was an increase of 4.1 miles, and with October 1920, in which year freight was the heaviest in history except for 1923, it was an increase of 3.9 miles. The average was an increase of 1½ miles over the result for September, 1923.

The average movement per car per day for the first ten months of year was 27.9 miles, compared with 22.9 miles for the corresponding period last year or an increase of five miles.

The average load per freight car in October amounted to twenty-seven tons, or seven-tenths of one ton less than the same month last year and two and nine-tenths tons less than in October, 1920. It was also two-fifths of a ton less than an average for September this year.

C. & N. W. Has New "Limited"

The Chicago & North Western Railway Company placed in service recently a new all-steel "North Western Limited," with equipment consisting of the latest models of standard Pullman sleeping cars, open-section and compartment, drawing-room sleeping cars, buffet-lounge cars, free reclining chair cars and dining cars. This train will operate over the shortest route between Chicago, Minneapolis and St. Paul, leaving Chicago daily at 6:30 p. m.; Milwaukee, 9 p. m., and arriving St. Paul at 7:05 a. m., and Minneapolis, 7.40 a. m. The same service will also be maintained Southbound. Special attention has been given to the electric lighting and also to ventilation throughout the entire train.

I. C. Employes In Illinois

Employes of the Illinois Central Railroad who live in Illinois, together with the dependent members of the their families, constitute a population greater than that of any city in the state outside of Chicago, according to a statement by President Charles H. Markham. The system in 1923, President Markham says, employed 29,000 persons living in Illinois. Figuring an average of four dependents to each worker, this gives a total of 145,000. The payroll for 1923 for Illinois Central employes in Illinois amounted to $47,700,000.

W. N. Doak, Vice-President of the Brotherhood of Railway Trainmen, has been appointed a member of the Research Council of the National Transportation Institute, as a representative of labor.

Conjunction” Key to R. R. Service

(Continued from page 13)

20. Detroit to Charleston:
    Detroit, Toledo & Ironton
    Carolina, Clinchfield & Ohio
    Charleston & Western Carolina
21. Toledo to Norfolk:
    Toledo & Ohio Central
    Zanesville & Western
    Kanawha & Michigan
    Ann Arbor Railroad (to Frankfort)
    Virginian
22. Minneapolis to Galveston:
    Chicago & Great Western
    Missouri, Kansas & Texas
    San Antonio & Arkansas Pass (Corpus Christi)
    Texas Mexican Railway (Laredo)
    Louisiana & Arkansas
    Gulf Coast Lines (Brownsville to New Orleans)

REGIONAL SYSTEMS.

23. Southern Railway System—For the Service f the great quadrangle between Washington, St. ouis, New Orleans and Jacksonville:
    Southern Railway
    Seaboard Air Line
    Mobile & Ohio
    Chesapeake & Ohio, from Louisville to Ashland and from Clifton Forge to Washington, with trackage rights over the Chesapeake & Ohio between Ashland and Clifton Forge for the operation of a through line from St. Louis to Washington.
24. Missouri Pacific System—For the service f the great quadrangle between St. Louis, Den- er, El Paso and New Orleans:
    Missouri Pacific
    Texas & Pacific
    Kansas, Oklahoma & Gulf
    Colorado & Southern
    Ft. Worth & Denver City
    International & Great Northern
25. Big Four System—For the service of the Ohio Valley, with gateways at Chicago, Peoria, St. Louis, Cairo, Evansville, Louisville, Cincinnati, Columbus, Cleveland, Toledo and Detroit:
    Cleveland, Cincinnati, Chicago & St. Louis
26. New Haven System—For the service of Lower New England:
    New York, New Haven & Hartford
27. Boston & Maine System—For the service of Upper New England:
    Boston & Maine
    Rutland
    Delaware & Hudson
    Maine Central
    Bangor & Aroostook
    Central Vermont

(The Boston and Maine to have entry into New York City from Chatham over the New York Central, and the New Haven to yield to the Boston & Maine the through route from Boston to New York by way of Willimantic in order to provide a competitive through route between Boston and New York.)

28. Florida East Coast Railway—Jacksonville to Key West with gateway at Jacksonville.

Gives Facility of Traffic

The foregoing plan creates eighteen competitive lines connecting Chicago and the important ocean ports of the country, four independent cross-country lines, and six regional systems; all co-ordinated and articulated for the convenient interchange of cars at junctions and the gateways. The purpose is to provide facility of traffic and competition in service. Some minor accommodations and rectifications will be necessary to complete the co-ordination, articulation and arrangement of the various systems. It will be necessary in some instances to transfer sections of track from one system to another, and this should be done in any and every case where a section of track, presently subjected to only local uses, may, by transfer to another system, facilitate through service and shorten connections and communications. And in every case where a railroad holds duplicate or parallel tracks to prevent a competitor from entering a particular gateway or terminal, one of such lines of track should be transferred in the interest of better connections and competition.

The essential and necessary thing for each system is unity of operation. Unity of ownership is desirable and important, but this will take time for its consummation.

1923 Meat Production Sets New Mark In Industry

Meat production during the year just closed has been the greatest in the history of the nation, and wholesale meat prices have been the lowest of a decade, or more, according to a review of the 1923 trade by Charles E. Herrick of Chicago, President of the Institute of American Meat Packers, Vice-President of the Brennan Packing Company and Chairman of the Committee on Foreign Trade of the Illinois Manufacturers' Association. He estimated that the production of meat for the year, owing largely to the increase in pork production, would exceed that of 1922, the year of greatest production hitherto, probably by one and one-half billion pounds.

"This enormous amount of meat—750,000 tons—would suffice the population of the United States for nearly a month. To distribute it would require 68,000 refrigerator cars," he said. "When so great an increased production can be marketed successfully, it speaks well for the conditions of the country."

The producer of livestock, Mr. Herrick pointed out, is receiving more for his cattle, sheep and lambs than he did ten years ago, but, in keeping with the lower prices of such products as pork loins, fresh pork shoulders, spare ribs, bacon, and all dry salt meats except fat backs, he is receiving somewhat less for his hogs than he did in 1913. The stockman was hard hit by deflation and is still suffering from its effects.

"I feel," continued Mr. Herrick, "that the packer accomplished a remarkable piece of work in merchandising so efficiently the products from the great numbers of hogs which the producers raised and marketed. During 1923 the American packers, whose traditional policy has been to take everything that the producer sends to market and pay for it on the spot, have bought and handled nearly 10,000,000 more hogs than they did during 1922."

Congressman McKenzie to Retire

John C. McKenzie of Elizabeth, Ill., Representative in Congress from the 13th District, and a member of the House Committee on Military Affairs, has announced that, with the expiration of his present term, March 4, 1925, he will not be a candidate for re-election.

FOREIGN TRADE

Study of Export Trade in Agricultural Products by Department of Commerce—Report Ready for Distribution

BECAUSE of the unsatisfactory conditions under which the farmers of this country have been laboring during the past three years, the 67th Congress ıcluded, in a bill providing for a study f raw material sources, a provision authoring the Department of Commerce to make thorough study of the export trade in agcultural products. Secretary Hoover apointed a committee, consisting of farmers, epresentatives of farm organizations and gricultural institutions, exporters, bankers, nd the United States Department of Agiculture, to assist in planning the work and n drawing constructive conclusions from he results. The preparation of the report, long the lines laid out and approved by he Committee, is being carried out by the taff of the Department of Commerce, both n this country and abroad.

This Department, by reason of its established staff of Commercial Attaches and Trade Commissioners in all the important foreign markets, is in possession of a large amount of information with regard to foreign trade in these commodities. The authority granted by Congress has enabled the Department to assemble further facts with regard to the flow of trade in the important farm products between all the principal countries as well as much information with regard to methods and conditions connected with export marketing.

These studies, which are now approaching completion, will be presented in a series of bulletins giving the important facts in the form of tables and diagrams, and discussing the changes which have taken place compared with the pre-war period.

These investigations will show where our exports of farm products have been going, where the exports from competing countries go, where the principal consuming countries get their supplies and the changes since the war. Questions as to how our export trade is actually carried on, how exporters buy and sell these products, how our exports are financed, will all be discussed. Other questions dealing with transportation, storage, warehousing, ocean freight, method of distribution in foreign countries, foreign import duties, the economic conditions, the purchasing power, the food and clothing requirements in the principal importing countries, will all be covered.

It is believed that these bulletins will contain much information of value to the farmers of this country and will enable them to have a clearer perception of the importance of foreign trade in these products and the conditions which affect them. It is the Department's desire to distribute these publications to leaders in agricultural thought throughout the country so far as the supply will permit. Upon request the Department of Commerce will be glad to place the names of persons interested in these publications on the mailing list to receive them.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

ALGERIA—8722, iron hoops, for casks; pipes, sheet iron.

AUSTRALIA—8724, equipment for regrinding shop; 8719, canvas, 100,000 yards, 36 inches wide, 16 ounces per square yard, not less than 52 yards in length.

AUSTRIA—8749, pyroxylin plaster (cellulose acetate base).

CANADA—8712, overcoats, underwear, shirts, ties, sweaters, etc., for men and boys.

CHINA—8707, drillings, cotton.

CZECHOSLOVAKIA—8763, tools, small, for metal workers; varnishes for metals and wood.

EGYPT—8703, shoes for children, cheap grade.

FRANCE—8718, boots, rubber; 8733, fruits, fish, especially apples; 8718, wearing apparel, army.

GERMANY—8750, asphalt, pure natural; 8709, canned corned beef, canned fruit; 8711, milk; 8720, canned meats; fats, edible; 8709, fruits, dried and canned; 8711, fruits, dried and fresh; 8720, grain; 8672, gasoline; kerosene; lubricating oils; oil products.

MEXICO—8721, barrels, oak, for liquid; 8716, cigarette-making machinery; 8728, engines, marine, low-speed, 10 to 16 horsepower.

NEW ZEALAND—8702, lumber, especially ready-cut.

PANAMA—8704, engines, gasoline or kerosene, for operating dairy equipment; dairy equipment of a daily capacity of 10,000 to 15,000 pounds of milk.

PORTUGAL—8748, machinery for manufacture of safety pins; machinery for manufacturing paper clips; machinery for manufacturing clamp buttons; machinery for manufacturing pen points; machinery for manufacturing shoe eyelids.

SCOTLAND—8766 tar and bitumen, for roads.

SOUTH AFRICA—8717, machinery for manufacturing ventilators and lead lights; 8714, milk bottle stoppers for quart and pint bottles; 8706, organs, low-priced; 8744, tennis rackets.

SPAIN—8754, sporting goods, including footballs, hockey balls, hockey bats, golf balls, and clubs, and tennis rackets; 8731, airplane engines, 25 to 100 Liberty 400 horsepower; 8765, blotting paper for offset printing; 8713, raisins.

URUGUAY—8742, machinery for making paraffine paper milk bottles.

Porto Rican Regulations

A. H. Bull & Company, General Agents for the Bull-Insular Line, Inc., with weekly Porto Rico sailing service, has issued the following bulletin of interest to Porto Rican shippers:

"The regulations of the United States Customs Service require us to file a complete return of properly executed Shipper's Export Declarations within the time prescribed by law after the sailing of a vessel. We therefore request your co-operation in assisting us to avoid the penalties imposed by filing these documents with us promptly.

"It will greatly facilitate the issuance of Bills of Lading, if shippers will attach a duly executed copy of Shipper's Export Declaration to the Bills of Lading when submitting Bills of Lading to us.

"We also wish to call your attention to the fact that, effective on and after Feb. 18, 1924, all ocean freight and other charges must be prepaid. No cargo will be accepted for shipment to Porto Rico 'Freight Collect.'"

Russia's Foreign Trade

The total imports of Soviet Russia during the fiscal year 1922-23, according to *Izvestia*, a Moscow publication, declined to 152,100,000 gold rubles, against 282,300,000 rubles in 1921-22. This decrease in imports, coupled with an increase in exports (from 63,900,000 rubles in 1921-22 to 133,200,000 rubles in 1922-23), resulted in reduction of the unfavorable trade balance, from 218,400,000 rubles in 1921-22 to 18,900,000 rubles in 1922-23, says the Department of Commerce.

U. S. Imports of Footwear

In the first nine months of 1923 the United States imported 1,338,206 pairs of footwear, other than rubber, valued at $1,196,606, and the Department of Commerce states these consignments comprised 671,938 pairs of dutiable footwear, valued at $221,839, and 666,268 pairs of free (261,733 pairs of boots and shoes and 404,535 pairs of slippers), valued at $974,767.

SALES MANAGEMENT

"Impossible Territory" Challenges Ingenuity and Imagination of Real Salesmen—Few Businesses Too Small

THE sales territory may be divided into three classes—(1) the easy, (2) the possible, and (3) the impossible, says Glen Buck in *The Stencil*. The first two will respond to the regular analysis and methods. It is the third class that challenges the skill of the salesman with imagination, for in that group may be found some novel sales outlets and thrilling adventures.

We have heard jokes about selling fans to Eskimos and snowshoes in the South Sea Islands, but we must not be too literal about it. It is in the unexplored territory that discoveries are made and many an alert saleman has found it possible to sell coals in Newcastle.

A new angle of interest is often the key to unsuspected sales.

A better and more economical manner of accomplishing any task is always desired, but it often requires real imagination on the part of the salesman to arouse the interest of the man who cannot conceive "what it's all about."

A recent story tells of remarkable sales of Victrolas to Chinese laundry-men in the city of Rockford, Illinois. Not a likely outlet, one might think. But when the sound of their native tongue appealed to the Chinese they flocked to buy machines and all the records published.

One could enumerate a long list of uses to which the Mimeograph has been put. But, even so, let us put no limitation on its potential field. Few businesses are too small to find some use for it and many untried uses are sure to be found for more machines in the larger business. Let us, while we are traveling the regular sales highways, look down the byways for new adventures.

Sets Special Hours for Salesmen

A practical difficulty which many jobbers encounter is found in establishing contacts with visiting store buyers. A statement of the difficulty and a solution are suggested in a letter recently sent to the Merchants' Association.

"We have found that it is the established custom in the trade that salesmen call at the resident offices between 8:30 and 10:00 A. M. Their reason for this is twofold—one, to see the city office buyer; two, to see the visiting store buyers," says the letter.

"As our first duty is to serve our clients, our buyers are frequently occupied in conferences with out-of-town buyers until 10 A. M., and therefore cannot give sufficient time to the interviewing of salesmen. Client store buyers, of course, have every facility for seeing salesmen between 8:30 and 10 A. M., but it is their prerogative as to whether they desire to interview the salesmen during that time or any other time. There are a larger number of buyers who spend a great deal of time interviewing salesmen that call at the office with merchandise, because in that manner they can extend the scope of their market information.

"We have discussed the problem for several weeks at the weekly conferences of our buying staff, and at the last conference we evolved a plan that we feel will be practical and at the same time convenient to both buyer and seller.

"Our plan is as follows: If a buyer cannot interview a salesman between 8:3 and 10 A. M. an appointment will be arranged for the same day, or within a few days following, in the afternoon between 4 and 5 o'clock. A special appointment card will be given to the salesman and he will positively be accorded an interview when he calls. Only a limited number of appointments will be made for the afternoon, so that each salesman will have sufficient time to discuss his proposition with our buyers. Manufacturers can feel free to write to us requesting appointments, and they will be assured that all specific appointments will be kept."

Silk Salesmen Organize

The sales directors of the Broad Silk Division of the Silk Association of America, who have functioned, heretofore, as a part of that division, have organized as a distinct group within the Association, and plan to undertake a definite program of activity. The objects of the group are the prevention of trade abuses, encouragement of the use of the uniform contract, the establishment of uniform terms and the education of the trade regarding technical facts affecting sales. W. H. Yelland, of the Carl Schoen Silk Corporation, is Chairman of the group.

U. S. Pensions Paid in 1923 Amounted to $263,012,500

According to the annual report of the Commissioner of Pensions for the fiscal year ending June 30, 1923, $263,012,500 were paid out for pensions in the fiscal year 1923 as against $253,807,583 in 1922. The cost for maintenance and expense of the pension system in 1923 was $1,992,063. The report states that the number of pensioners on the roll June 30, 1923 was 539,756, as against 547,016 on June 30, 1922. Of the pensioners on the roll, 168,623 were Civil War veterans, 264,580 Civil War widows, 68,393 Spanish War veterans and 13,167 Spanish War widows. There are yet on the pension roll forty-nine soldiers of the Mexican War and forty widows whose husbands served in the War of 1812.

By classes there were on the pension roll at the close of the fiscal year 253,605 soldiers, 278,700 widows, 2,333 minor children, 931 helpless children, 4,106 dependents of soldiers, and 81 female army nurses. During the year 25,452 Civil War veterans died, as against 25,082 in the previous year, and 23,974 widows, as against 21,259.

The total disbursements to pensioners under the pension system, which practically dates back to 1790, have been to the close of the fiscal year $6,606,356,621, of which $6,224,106,631 have been paid out on account of the Civil War and $105,533,496 on account of the war with Spain.

Armour & Co. Buys Soap Business of B. T. Babbitt

The well-known corporation of B. T. Babbitt has sold its soap, cleanser and soap powder business, with its factories at Babbitt, N. J., to Armour & Co. The lye, caustic and chlorinated lime portions of the business will be continued by the present controlling interests, Mendleson & Sons, of Albany, under the well-known brand names.

Armour & Co. will take possession of the New Jersey plants and continue the sale of the leading lines, such as "Babbitt's Best" soap, "Babbitt's Cleanser," "1776 Soap Powder," etc., while the Mendlesons, who have for several years past owned control of the Babbitt stock, will merge those brands with those made in their Albany plant for many years past.

143,406 Pennsy Stockholders

On Dec. 1, there were 143,406 holders of Pennsylvania Railroad stock, a new high record and an increase of 879 over the November total. The average holding on Dec. 1 was 69.63 shares, the smallest total since the present number of shares has been outstanding and a decrease of 3.42 since a year ago.

arthquake Aids Japanese Trade, says F. R. Eldridge

(*Continued from page 5*)

indles destroyed were efficient units and hers inefficient units, still the net result Japan's cotton industry has been a capac- production during succeeding months, that today, with only 90 per cent of her evious spindlage, Japan is producing at e rate of 9,000,000 pounds of cotton yarn excess of pre-earthquake production. The arket for this cotton yarn is being found China, where conditions are not only im- roving, but where the boycott against panese goods has been definitely de- ared off as a result of the earthquake.

Economic Condition Improved

Before the earthquake, Japan's economic ndition was not sound. The ever-in- easing population was demanding larger nports of foodstuffs each year, and mar- ets for Japanese manufactured goods, uilt up during the war, were rapidly windling under competitive conditions in orld markets. But cotton yarn is the rincipal manufactured product which Ja- an exports, and with this industry in atisfactory shape, and with the stimulated demand for Japan's chief agricultural roduct, raw silk, it is difficult to believe hat Japan has not improved economically s a result of the disaster.

The United States Department of Com- merce, believing in Japan's financial strength, and perceiving an industrial boom of unprecedented proportions, is taking steps to interest American manufacturers and exporters actively in the Japanese market. Recently it has called together the presidents of various trade associations and impressed upon them the immediate market for reconstruction materials, such as lumber, iron and steel, hardware, plumbing and sanitary equipment, etc., and further pointed out to them the possibility of making the emergency demands for these materials the entering wedge for permanent market developments in Japan. In order to do this successfully, we must have permanent representation, and the Department is suggesting not only combinations of noncompetitive lines with single sales representatives, but also pointing out the advantages of the Webb-Pomerene Law for combinations of competitive lines of manufacture for export. Our motto for this work has been—"Japan has the money; the business is there; go get it."

East St. Louis Shows Big Jump In Property Taxes

The Department of Commerce announces that the costs of government for the City of East St. Louis, Ill., for the fiscal year ended Dec. 31, 1922, amounted to $2,282,283, which was a per capita cost of $33.13. In 1917 the per capita cost was $19.43, and in 1914, $16.07, the totals for these years being $1,256,089 and $998,377, respectively. The per capita costs for 1922 consisted of expenses of general departments $17.45; payments for interest, $2.71; and for outlays, $12,97.

The total revenue receipts for 1922 were $2,107,510, or $30.60 per capita. The per capita excess of governmental costs over revenue receipts is largely on account of permanent improvements, the costs of which were met by the issuance of debt obligations.

Property taxes represented 59.5 per cent of the total revenue for 1922, 53.8 per cent for 1917, and 52.8 per cent for 1914. The increase in the amount of property taxes collected was 9.6 per cent from 1914 to 1917, and 89.4 per cent from 1917 to 1922. The per capita property taxes were $18.21 in 1922, $10.24 in 1917, and $9.73 in 1914. Business and nonbusiness licenses were 6.5 per cent of the total revenue for 1922, 18.4 per cent for 1917, and 19.4 per cent for 1914.

The net indebtedness (funded and floating debt, less sinking fund assets) was $35.68 per capita for 1922, $26.01 for 1917, and $21.57 for 1914. For 1922 the assessed valuation of property subjected to ad valorem taxation for the city corporation was $24,012,321. The levy for all purposes for 1922 was $2,209,489, this being a per capita of: Total, $30.62; city corporation, $7.43; school district, $11.84; park district, $1.63; sanitary district, $4.81; state, $1.57; and county, $3.35

In all of the data shown for this city the transactions of the independent school, park and sanitary districts are included.

A congress of Chambers of Commerce of the British Empire will be held in London in 1924.

AUTOMOBILE—AVIATION

Minimum Production of Automobiles and Trucks in 1924 Is Set At 3,500,000—Decrease of 12½% from 1923

PREDICTIONS that a minimum of 3,500,000 automobiles and trucks will be manufactured in 1924 are made in the annual survey and analysis of automotive conditions recently issued by the Motor and Accessory Manufacturers' Association. The figures are based on questionnaires sent out by the Association.

Replies to these questionnaires showed wide divergence. Less than 5 per cent of those answering held out hope for a production in excess of 4,000,000 cars and trucks, the 1923 total; about 20 per cent looked forward to maintenance of that production for the year; another 20 per cent expected a drop to approximately 3,000,000, and most of the rest—or a substantial majority—figured that 1924 production will be about 3,500,000 cars and trucks.

A production of 3,500,000 motor vehicles in 1924 would be the largest in the history of the industry with the exception of 1923. Although it would be a drop of 12½ per cent from the 4,000,000 mark, it would be 33 per cent above the 1922 total, which established a new high record at that time.

The figures for the last few years follow:

Year—	Cars and trucks.
1916	1,583,617
1917	1,868,949
1918	1,153,638
1919	1,974,016
1920	2,205,197
1921	1.661.550
1922	2.659.064
1923 (estimated)	4,000,000

It is estimated that there are now about 17,000,000 automobiles and trucks in operation throughout the world, 14,000,000 of them being in the United States.

Danger of Auto Gas in Winter

Warning to motorists that, with the coming of Winter, it is imperative to guard against the deadly hazard which may be encountered when automobile engines are permitted to run in closed garages, is given by the Department of the Interior. Numerous articles have been published at various times by the Bureau of Mines and other agencies in which great stress was laid on the extremely poisonous properties of the gas, carbon monoxide, which is one of the products formed when gasoline is burned in an automobile engine. In spite of these repeated warnings, cases of asphyxiation continue to be reported in the daily press when the advent of cool weather causes the closing of garage doors and windows in order to retain heat.

Four-tenths of 1 per cent of carbon monoxide, that is, 4 parts per 1,000, will kill an ordinary man in one hour, and a higher concentration will prove fatal in a much shorter time. Automobile tests made at the Pittsburgh Experiment Station of the Bureau of Mines show that the amount of carbon monoxide present in the exhaust gases varies from 2.4 to 9.5 per cent and, consequently, that the air in a closed garage will reach the danger point in a very few minutes.

It is a common practice among motorists on cold days, to allow the engine to idle for five or ten minutes before leaving the garage, in order to warm up the oil and cooling water. This is an extremely dangerous practice and cases are reported frequently where the driver is found dead at the wheel. If it is desired to warm up the engine, all windows and doors should be opened, or better still the car should be driven into the open air where the toxic exhaust gases are quickly dissipated.

R. E. Olds Retires

R. E. Olds has retired as President of the Reo Motor Car Company, the directors electing R. H. Scott to that position. Mr. Scott for years has been Vice-President and General Manager. Mr. Olds was named as Chairman of the Board.

No Holiday Layoff for Olds

Owing to the exceptionally large demand for the Oldsmobile Six, the Olds Motor Works was forced to eliminate all holiday layoffs, with the exception of Christmas and New Year's days, and will not shut down for inventory this year. The factory is running close to the limit of its present capacity, and efforts are being made to further increase production during January. The last quarter of 1923 was one of the best three-month periods ever enjoyed by the Company. Sales during that time more than doubled those of the same month of 1922—over 11.000 in 1923 compared to 5.000 in 1922.

Auto Exports Show Gain

During October a total of 10.464 passenger cars were exported from the United States, according to statistics compiled by the Bureau of Foreign and Domestic Commerce. In the same month last year 6.446 pasenger cars were exported. Trucks totaling 2.311 were exported in October as compared with a total of 791 in the corresponding month of the preceding year.

Total value of October's passenger car shipments was $8,088,832, as contrasted with $5.093,712 in October, 1922. Value of trucks exported during the month was $1,415,419. This is compared with $789,955 in the corresponding month of last year.

For the ten months ended with October passenger cars numbering 106.099 and valued at $74,671,859 were sent abroad. This is compared with 54,774 passenger cars valued at $42,125,847 shipped abroad in the corresponding period last year. Trucks exported during the ten-month period totaled 19,867 and were valued at $11,591,265. This is in contrast to the first ten months of 1922 when 8,871 trucks valued at $6,803,655 were exported.

Fokker Planes Round-the-World

The round-the-world flight to be attempted early in 1924 by Commander Secadura Cabral and Admiral Gage Coutinho of the Portuguese Navy will be made by Fokker seaplanes. The route of the flyers, as originally outlined, is Lisbon to Japan, via India, to Newfoundland, via Alaska, and to Lisbon by way of the Azores. According to later advices this route may be slightly changed to include the United States.

Big Auto Sales in California

Total sales of all automobiles in the State of California for the first nine months of 1923 exceeded the same period of 1922 by 57 per cent. The sales of Buicks showed an increase of 72 per cent, while Ford's increase was 60 per cent. This is according to figures released by the *Motor Registration News*, a statistical journal published at Oakland.

hysical and Dental Examination of Adults Is Object of New Association

HYSICAL and dental examinations of every adult in Illinois, at least once a ar, in the interest of better health and ngevity, will be the object of the Illinois sociation for the Promotion of Periodic ealth Examinations, organized at a meetg at the Hotel LaSalle, Chicago. Repsentatives of state and local medical and ntal societies, American Red Cross, Illiis State Tuberculosis Association, Illinois ate Department of Health, Chicago Dertment of Health, various organizations evoted to health, civic and industrial enrprises, were present. Dr. Leroy P. Kuhn the Illinois Manufacturers' Mutual Caslty Association, acted as Chairman. The llowing Directors were elected:

Dr. Robert Hayes, Illinois Tuberculosis ssociation.

Dr. Isaac D. Rawlings, Director, Illinois epartment of Health.

Dr. Charles J. Whalen, Editor, *Illinois tate Medical Journal.*

Mrs. Theodore Sachs, Business Manager, hicago Tuberculosis Institute.

David F. Tilley, Secretary, American Red ross.

George R. Meyercord, Advisory Comittee, Illinois Manufacturers' Association.

Arthur D. Black, Dean, Northwestern ental College.

Officers will be elected at a future meetng of the directors. The work will be educational and persuasive. Individuals and organizations will be asked to join in the movement.

"Americans have the best teeth in the world because they have the best dentists and because they have been taught to have their teeth examined at regular intervals," declared Dr. Edward H. Ochsner, President of the Illinois State Medical Society. "Regular physical examinations will do the same thing for the public's general health. This movement will be in the interest of the public, the laboring man, employers and casualty companies as well as the physicians. If we can reduce the average day's illness, three, two or even one day a year millions of dollars will be saved as well as profoundly beneficial results obtained in the heath of the community."

Dr. Archibald Church, President of the Chicago Medical Society, said that annual physical examination of adults would greatly benefit public health. He referred to the many cases of impaired health of young men examined physically during the war.

J. Reynolds Klein of the Health Department of the Hamilton Club, expressed the belief that every club in the state would approve the movement.

Fyffe on Public Library Board

Colin C. H. Fyffe, General Counsel for the Illinois Manufacturers' Association and formerly counsel for the Board of Election Commissioners of Cook County, has been appointed a member of the Chicago Public Library Board by Mayor Dever. Other appointments to that Board were Michael Iarussi, Max Henius, Anton J. Kolar, Jr., and Louis Severson. All have been approved by the City Council of Chicago.

Homes for 379,348 Families Built In 1922, Says Report

Homes for 379,348 families in the United States were provided by the national building program of 1922 in cities and towns with a population of 25,000 or more. A detailed compilation of all building in the country by the Department of Labor has just been completed. It does not include farm dwellings and those in the small communities.

"Unless American families are multiplying faster than census figures indicate, however, the housing situation in the country is being met," says the Department's report.

The Department figures show an increasing tendency on the part of urban dwellers to concentrate in apartment houses and two-family dwellings. The figures cover 272 of the 288 cities with 25,000 or more of population. They show that more than half of the building construction, 51.6 per cent, was for residence purposes and that residence buildings ran 64.6 per cent of the total cost of a building construction program which ran nearly $2,000,000,000."

BUSINESS AND FINANCE

Federal Income Tax Returns for 1923 Are Due; Branch Offices Established—Simpler Forms Are Provided

JANUARY 1, 1924, marks the beginning of the period for filing income-tax returns for the year 1923. The period ends at midnight of March 15, 1924. Heavy penalties are provided by the revenue act for failure or willful refusal to make a return and pay the tax on time.

In the 7th District, of which Miss Mabel G. Reinecke is Collector of Internal Revenue, a number of branch offices where forms for making out the income tax may be obtained and filed have been established. Five others than in the Federal Building have been set up in Chicago, with additional branches at Aurora, Joliet, Rockford, Peoria and Rock Island.

Forms are also available at the offices of the Internal Revenue Collector downtown in the Federal building, Chicago, where they may be obtained by mail.

Form 1040A, heretofore used for filing returns of individual net incomes of $5,000 and less, from whatever source derived, has been revised and simplified in the interests of the largest class of taxpayers, salaried persons and wage earners. The new form will be used for reporting net income for the year 1923 of $5,000 and less derived chiefly from salaries and wages.

Reducing to a minimum the problem of correctly making out an income tax return, Form 1040A consists of a single sheet in (which space is provided for answers to only three questions in relation to income: salaries, wages, commissions, etc.); interest on bank deposits, notes, mortgages and corporation bonds, and "other income." On the reverse side are instructions. Formerly Form 1040A has consisted of six pages, the questions pertaining not only to salaries and wages, but to income from business, professions, sale of real estate and other sources. It is estimated that for the year 1923 more than 4,000,000 persons, or 70 per cent of those who annually are required to file income tax returns, will use the new form.

Persons, any part of whose income for the year 1923 was derived from business or profession, farming, sale of property or rents, regardless of the amount, will be required to use the larger form, 1040. The use of Form 1040 will be required, also, in cases where the net income was in excess of $5,000, whether from salary, business, profession or other taxable sources. Formerly Form 1040 was used only for reporting individual net income of more than $5,000.

Forms for filing individual returns of income will be sent to persons who filed similar returns for the year 1922. It being impossible to determine this year the form desired by the taxpayer—whether he be a man whose income was derived chiefly from salary or wages or from business, profession or other taxable sources—the taxpayer will receive both forms and is advised to note carefully the instructions regarding their use.

Chicago F. R. B. Election

The recent balloting for Directors of the Federal Reserve Bank of Chicago resulted in the re-election of E. L. Johnson of Waterloo, Iowa, by banks in Group 3 to serve as a Class A director, and Robert Mueller of Decatur, Ill., by banks in Group 2 to serve as a Class B director. Each of these directors will serve for a term of three years, beginning Jan. 1, 1924.

Stock of Money in Circulation

The Treasury Department at Washington has issued a statement showing the stock of money in the country and the amount in circulation after deducting the moneys held in the United States Treasury and by Federal Reserve banks and Agents as of Dec 1. They show that the money in circulation at that date (including what is held in bank vaults) was $4,923,157,751, as against $4,616,508,059 at the corresponding date of the previous year, but comparing with $5,628,427,732 on Nov. 1, 1920. Just before the outbreak of the European war, July 1, 1914, the total was only $3,402,115,427.

To Form Foreign Trade Bank

The creation of a Federal Reserve Foreign Bank of the United States, under the supervision of the Federal Reserve Board, to be located in New York, is contemplated in a bill introduced in Congress by Senator Owen of Oklahoma. This bank would have an authorized capital of $1.000.000.000, and would be authorized to begin business with a paid up capital stock of $500.000.000 in gold. The stock is to be taken at par by the reserve banks pro rata according to their capital and surplus to be paid for in gold.

The bill carries permission for the issuance of banknotes to the extent that it has a coverage of a minimum of 20 per cent in short term bills, indorsed by member banks in good standing.

456 Farm Loans in Year

A total of 456 applications for loans for agricultural and live stock purposes aggregating $34,061,000 were approved by the War Finance Corporation during the past year, according to the annual report of that agency transmitted to Congress by Managing Director Meyer. The report covered the year ended Nov. 30 last.

Of this sum $1,980,000 represented advances authorized to 144 banking and financing institutions, $7,581,000 to thirty-six live stock loan companies and $24,500,000 to five co-operative marketing organizations. Under these commitments, as well as under commitments made prior to November 30, 1922, $1,450,000 was actually advanced to banking and financing institutions, $6,644,000 to live stock loan companies and $14,048,000 to co-operative marketing associations, making a total of $22,142,000.

In addition, the corporation approved during the year 4,671 applications from banks and 483 applications from live stock loan companies, for the renewal of outstanding loans totaling $100,479,000.

From Dec. 1, 1922, to Nov. 30, 1923, the repayments on the corporation's agricultural and live stock loans aggregating $101,406,000, of which $54,763,0000 was repaid by banking and financing institutions, $26,472,000 by live stock loan companies, and $20,171,000 by co-operative marketing associations. In addition, $995,000 was repaid on the corporation's loans, bringing the total repayments during the year to $102,879,000, or an average of $8,573,000 a month.

At the close of business on November 30, 1923, the corporation had outstanding, on loans of all classes, a total of $104,646,000, as follows: War loans, $27,186,000; export loans, $1,065,000; agricultural and live stock loans, $76,395,000.

ew Air Landing Field for Chicago, Is I. M. A. Committee's Announcement

HICAGO is to have an aircraft landing field fifteen minutes from the loop or s, by motor car. It will be at Grace reet and will be equipped with runway, ngars, repair shop and will be properly arked so that aircraft can readily distingsh it day and night.

This announcement was made at a recent eeting of the Aircraft Production Comittee of the Illinois Manufacturers' Assoation by M. L. Bromberg, of the Chigo Trunk & Leather Goods Company, who ated that he had been definitely promised e landing field by the Lincoln Park Board Commissioners. It was decided also to k Mayor Dever and other city authories to take favorable action regarding a unicipal landing field at 63rd Street and icero Avenue. This property can be obained from the Board of Education on a asis of $500 annual rental.

"The hangar rental fees will more than ay the cost of improvements at these elds," said Mr. Bromberg. "Chicago needs everal landing fields. 'Checker Board' eld is no longer available and was not ractical because it was so far away from own-town Chicago."

A survey made by the Aircraft Producion Committee indicates there are at least ,700 firms in Illinois who can supply aterial entering into aircraft production. o special machinery is needed, simply igs and dies.

The United States Government has an aircraft building program providing for he expenditure of $10,000,000 a year for aircraft for the next ten years.

"All that is needed to make Illinois the center of aircraft production in the United States," said I. F. Dains of the Western Stoneware Company, Monmouth, Chairman of the Aircraft Production Committee, "is an active interest in landing fields by the public. We have the best field in Illinois at Monmouth and it is one of the four best fields in the United States. We have four hangars, a machine shop and other facilities, and the Midwest Airways Corporation has students in training for commercial aviation. Frequently we make two trips to Chicago daily and we make regular trips to Terre Haute, Ind., Springfield, Peoria, Bloomington, Ottawa, Ill., and Davenport and Burlington, Iowa. Not long ago we had an offer of $2,000 to take a man to Honduras. We make regular trips sixteen miles distant to the Mississippi River, charging $5 for the round trip, four passengers to the car."

The Committee took steps to emphasize the need of uniform Federal regulations for flying, providing for licensed pilots and regular inspection of aircraft by competent persons. It was stated at the meeting that "stunt flying" should not be encouraged, as it detracted from the commercial possibilities of aircraft.

W. D. McHugh, Harvester Co. General Counsel Dead

William Douglas McHugh, General Counsel and Director of the International Harvester Company and former Judge of the United States District Court of Nebraska, died recently at his home, 232 East Walton Place, Chicago. He had been ill for several months but continued his personal direction of the Company's legal affairs until within a few days of his death.

Judge McHugh was born at Galena, Ill., in 1859. He first learned the shoemaker's trade, which he followed for several years. Later he entered the Illinois State Normal School at Normal, Ill., and became a school teacher. He studied law and was admitted to the bar in 1883, practicing first at Galena. When only 37 years old he was appointed Judge of the Federal District Court of Nebraska, resigning the following year to open practice in Omaha, where he remained until he became General Counsel of the International Harvester Company in 1920.

He was married in 1888 and is survived by his widow and two children, Mrs. Adele Baird and William D. McHugh, Jr., both of Omaha.

Wire Tax Repeal Is Before Congress; Manufacturers Should Demand Action

MANUFACTURERS NEWS has been active in waging a campaign to secure the repeal, by Congress, of the tax on telephone and telegraph messages, holding that since similar taxes on freight, passenger and express charges—all war measures—were long ago repealed, this tax forms an unnecessary and heavy burden on industry and commerce and should be abrogated by Congress with as little delay as possible. Scores of organizations in all parts of the United States approved the campaign of MANUFACTURERS NEWS, adopted resolutions calling for the repeal of these taxes, and sent these resolutions to their Congressional representatives.

Both President Coolidge and Secretary of the Treasury Mellon have endorsed the repeal of these taxes. The President mentioned it briefly in his message to Congress, and again at greater length in his message transmitting the annual budget to Congress. Secretary Mellon has incorporated it in his proposed Treasury Bill. It is now an administration measure, and is formally before Congress.

One of the organizations which has been working for the repeal of these taxes, and which endorsed the campaign of MANUFACTURERS NEWS, is the Grain Dealers National Association of Toledo, O. Under its leadership, supplementing the work of MANUFACTURERS NEWS, Representative William M. Morgan of the 17th Ohio District, and Senator Frank B. Willis of Ohio, have introduced similar bills in Congress asking for the repeal of these taxes. Congressman Morgan's bill has been referred to the Ways and Means Committee of the House, and is known as H. R. 91.

Recently the Grain Dealers National Association issued a letter to 247 associations and trade organizations asking support of these two bills, saying in part:

"It is gratifying to know that Secretary of the Treasury Mellon has recommended in his report to Congress that certain taxes can be reduced and certain others abolished, provided Congress does not pass a Soldiers' Bonus Bill. One of the taxes to be abolished is the tax on telegraph and telephone messages.

"Mr. Mellon, in his proposed new Treasury Bill, which will be referred to the Ways and Means Committee, will advocate the repeal of the tax on telegraph and telephone messages. No one knows at this time just what will happen to the Treasury Bill. The Ways and Means Committee may recommend it to Congress in substantially the form in which it was submitted, or the Committee may greatly emasculate it, depending largely upon the pressure brought to bear upon Congress to pass a Soldiers' Bonus Bill.

"The tax on telegraph and telephone messages was a war tax and is indefensible in peace times. The tax amounts to $30,000,000 annually and is a heavy burden upon commerce. The taxes upon freight, passenger and express charges, which were also placed in the revenue bill in war time, have long since been repealed and there is no reason why the telegraph and telephone taxes should not also be abolished.

"If the Soldiers' Bonus fight places the Mellon recommendations for tax reduction in jeopardy, we want the tax on telegraph and telephone messages abolished anyway.

"You are, therefore, asked to give your aid in securing the repeal of the tax. Ask your members to help you and write to their Representatives and Senators, as well as the members of the Ways and Means Committee, urging the passage of the Morgan and the Willis Bills. This will keep before Congress the important fact that the business interests want the wire tax repealed, no matter what is done about the Revenue Bill."

The membership of the Ways and Means Committee of the House numbers twenty-six; the address of each is simply "House Office Building, Washington, D. C.," and their names are:

REPUBLICANS: William R. Green, Chairman, Iowa; Willis C. Hawley, Oregon; Allen T. Treadway, Massachusetts; George M. Young, N. Dakota; James A. Frear, Wisconsin; John Q. Tilson, Connecticut; Isaac Bacharach, New Jersey; Lindley H. Hadley, Washington; Charles B. Timberlake, Colorado; Ogden L. Mills, New York; Henry W. Watson, Pennsylvania; Frank Crowther, New York; Charles C. Kearns, Ohio; Carl R. Chindblom, Illinois; James C. McLaughlin, Michigan.

DEMOCRATS: John N. Garner, Texas; James W. Collier, Mississippi; William A. Oldfield, Arkansas; Charles R. Crisp, Georgia; John F. Carew, New York; Whitmell P. Martin, Louisiana; Peter F. Tague, Massachusetts; Cordell Hull, Tennessee; Clement C. Dickinson, Missouri; Henry T. Rainey, Illinois; John J. Casey, Pennsylvania.

This Committee will handle all tax legislation in the present Congress.

Col. Pelouze Again Heads Illinois Waterway Body

The Illinois Deep Waterway Commission, the personnel of which was recently completed by Governor Small, is again headed by Col. William Nelson Pelouze, President of the Pelouze Manufacturing Company, Chicago, who was re-elected Chairman at a meeting on Dec. 28. M. K. Northam was re-elected Vice-Chairman, and State Representative Ben L. Smith, of Pekin, Ill., was elected Secretary.

Other members of the Commission are Joy Morton, John T. Pirie and Everett C. Brown of Chicago; State Senator Martin Bailey of Danville, State Representative Charles E. Moore of Hindsboro, and State Representative Harry Wilson of Pinckneyville.

The Illinois Deep Waterway Commission is appointed by the Governor in the interests of the Great Lakes-St. Lawrence deep waterway project which was recently approved by President Coolidge in his message to Congress.

Building Contractors of U. S. to Meet in Chicago

Three important meetings of building contractors will be held in Chicago during January. The first will be that of the National Association of Building Trades Employers on Jan. 7 and 8. The second will be the Associated Building Contractors of Illinois the following week, Jan. 14, 15 and 16. At the same time the annual convention of the Builders' and Manufacturers' Mutual Casualty Company will be in session. The third big convention of contractors will be the Associated General Contractors of America at the Hotel LaSalle on Jan. 21, 22 and 23. This will be the fifth anniversary of the National organization, which was organized in Chicago in November, 1918.

Among the speakers will be:

"The Purpose and Progress of Equipment Standardization": C. E. Bement, President, Novo Engine Co., Lansing, Mich.

"Standard Highway Contracts a Public Service": Gen. R. C. Marshall, Jr., General Manager, Associated General Contractors of America.

"Economic Aspects of Day Labor Construction": Arthur S. Bent, Bent Brothers, Los Angeles, Cal.

"Bonds As a Gauge of Responsibility": N. F. Helmers, of Siems, Helmers & Shaffner, St. Paul, Minn.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

AMUEL INSULL, head of many public utility concerns in the Middle West, luding the Commonwealth Edison Comny, the Middle West Utilities Company, Public Service Company, and the Peo s Gas Light & Coke Company, in a re nt article in *Utility Investors News*, ad essing the employes and stockholders of ose corporations on the subject, "The esent Public Utility Situation, and the ture," said:

"I thought it might interest you to know w much cash has been invested since mistice Day, 1918, in the various utilis that are connected with our group. In d immediately around Chicago, there ve been $113,250,000 invested in that me. If you will include the subsidiaries the Middle West Utilities Company, in e various states of the Union, it brings e total cash investment since Armistice ay, 1918, up to $160,000,000.

"It might interest you to know what we e spending just at this time. I have given ou the figures of what has been spent ver the period from Armistice Day, 1918, p to date. In the year 1923, our various ompanies within the Chicago area will ave spent for new plant nearly $42,000,00. In 1924 they will spend $46,000,000. nd if this is included in the rest of our roup—that is, the Middle West Utilities ompany's subsidiaries—our total expendtures for plant purposes in 1923 will mount to just under $55,000,000, and in 924, to just over $65,000,000.

"The various concerns which I have harge of, including the subsidiaries of the Middle West Utilities Company, have 133,548 stockholders at this time. The Commonwealth Edison Company has 37,689 stockholders; the Public Service Company has 18,889; the Middle West Utilities Company and its subsidiaries, 65,300 stockholders; the Peoples Gas Light and Coke Company, 9,451 stockholders; and the Northern Indiana group, 2,319 stockholders.

"We are great believers in the community owning these properties. We think that is the solution—the answer—to municipal ownership."

Biggest Hydro-Electric Plant

The world's largest hydro-electric power unit was placed in commercial operation at Niagara Falls recently, in the new power plant of the Niagara Falls Power Company on the American side of the Niagara River. The generating unit is a 65,000 kw-a. 107 r. p. m., 12,000 volt, 25 cycle vertical waterwheel driven generator, driven by a 70,000 h. p. hydraulic turbine, with a total weight of over 1,750 tons. It is the first of two such units now being installed by the General Electric Company and the William Cramp & Sons Ship & Engine Building Company of Philadelphia. The station, when completed, will have a rated capacity of 454,000 horsepower. The unit just installed uses 3,500 cubic feet of water per second with an efficiency of at least 93 per cent. Using the same amount of water formerly used by seven 5,000 horsepower units, it delivers energy equivalent to the output of fourteen such units.

Utilities to Be Merged

The New York Central Electric Corporation, a new organization, has been granted permission by the Public Service Commission of that state to purchase six public utility companies in the vicinity of Rochester, all of which will be united in one system. The companies to be taken over are:

The Perry Electric Light Company; Warsaw Gas & Electric Company; Hornell Electric Company; Dansville Electric Company; Yates Electric Light & Power Company and the Wayne Power Company.

The Company is capitalized at $1,685,000, which will consist of $800,000 of 7 per cent cumulative preferred and $885,000 of common stock. Officers of the corporation are: President, George W. Olmstead; Vice-President, E. L. Phillips; Secretary, Henry R. Frost; Treasurer, R. S. Van Dorn.

24,738,758,739 "Talks" By Phone

Telephone messages or talks numbered 24,738,758,739 last year, it was estimated by the Census Bureau, which recently announced its report of telephones for 1922. There was an increase of 2,893,036,404 messages or talks, amounting to 13.2 per cent over 1917.

Operations of the telephone companies showed $684,904,736 in revenue, including assessments of mutual companies. That was an increase of 75.8 per cent over 1917. Value of plants and equipment was placed at $2,205,121,610, an increase of 47.8 per cent. Employes numbered 312,137, an increase of 18.8 per cent, and wages and salaries paid aggregated $553,263,801, an increase of 101.1 per cent.

There were 57,248 systems or lines, an increase of 7.5 per cent; 37,265,528 miles of wire, an increase of 29.3 per cent; 14,346,701 telephones, an increase of 22.4 per cent, and 19,254 public exchanges, a decrease of 9.1 per cent.

Approves New Telephone Plant

The Executive Committee of the Illinois Bell Telephone Company has approved an expenditure of $562,778 for a new plant in the City of Chicago, and $37,017 for Illinois outside of Chicago, making a total of $599,795. The total approved this year is $19,697,504.

Facts About City-Owned Plants

A nation-wide survey just completed by the National Electric Light Association, based on compilations of the United States Census Bureau, shows the following facts regarding municipal ownership:

The majority of the municipal plants are in towns of 1,000 population or less, where funds cannot be raised except by pledging public credit.

The municipal plants produce only 4 per cent of the electricity generated in this country, and this percentage is constantly decreasing.

The average rate of all municipal plants is more than twice as high as the average rate of all companies reported by the census.

There has been a great increase in the number of municipal plants which have shut down their generating plants since 1917.

"Of the population of the United States served with electricity, the companies serve 93.8 per cent and the municipal plants 6.2 per cent," says the survey. "The average city tax rate in 1921 in cities over 30,000 having municipal plants doing commercial business was $19.31. The average city tax rate for the non-municipal plant cities nearest in population to the above was $15.50. Exempting municipal plants from taxation necessarily means that the tax rate on other property must be increased. Approximately 8 per cent of the gross incomes of private companies is paid direct in taxes and about 11 per cent additional goes to the tax man through taxation on its securities."

Electric Railways Gain

Although great difficulties have confronted the electric railways of the country in the last ten years, particularly in keeping the cars running, the industry is growing stronger daily, James W. Welsh, Secretary of the American Electric Railway Association, says. In proof of his statement, Mr. Welsh offers these facts:

In 1922 there were 117 electric railway rides sold for every man, woman and child in the United States. In 1917 only 109 were sold and in 1912 only 100.

More than 13,000 new cars have been put into service during the last five years.

There are 80,000 electric railways cars operating in the United States.

About $250,000,000 will be spent for improvements this year.

Much useless track has been done away with in recent years and supplemental bus service added.

"Electric railways have come back again," Mr. Welsh says.

United Light Sale Details

Details in connection with the proposed sale of all of the assets of the United Light & Railways Company to the United Light & Power Company, newly organized, have been made known to stockholders of the former company. The authorized capitalization of the new company consists of 500,000 shares each of Class A and Class B preferred and 250,000 shares each of Class A and Class B common, all of no par value. The funded debt of the United Light & Railways Company will be assumed.

How to Insure Sales for Your Product!

The chief asset of any business is the demand for its product. As long as that demand continues, the business is on a sure foundation. But let that demand subside, and every other asset of the business is in danger of becoming a liability.

IN times of prosperity and a rising market there is a general demand for the products of industry that comes to be accepted as a matter of course. It is seldom listed among the assets of the business—it is simply assumed that it will always be there.

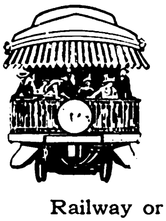
But, overnight, conditions may change—as they have done before—and the matter-of-course demand becomes conspicuous by its absence. The business, once strong and flourishing, is suddenly found to be in a very tight place. The demand had not been insured—and yet the entire business depended upon its continuance.

The modern, economical way to insure the market for any reliable product is by Advertising to the public which consumes it. Advertising creates a steadily increasing number of customers who desire the product, and ask for it by name.

Changes in business conditions have little effect on a steady consumer demand for trade-marked articles of common use. The dealer may carry a lighter stock, and for a short time the demand through the jobber may seem curtailed; but just as sure as customers are calling on the dealer for the product, he is sure to supply it, and orders soon begin to flow in to make up for the temporary curtailment. The total consumption continues about the same.

Any manufacturer who has an article for popular consumption that can be trade-marked has the opportunity to insure his consumer market and retail sales by means of Advertising.

During the present business condition the manufacturers who have insured their demand by Advertising are in a far better position—in every way—than those who have trusted to the current demand that was not of their creating.



In your travels—

Business or Pleasure

At Luncheon—

THE busiest business man enjoys quiet relaxation at lunch time. The cuisine must be satisfying; the service must be prompt and unobtrusive; and the atmosphere of the dining-room may be a pleasing feature.

The Pompeiian Room emphasizes all of these factors so important to a luncheon. It is as delightful here at noon time as during the dinner hours, or after the theatre. Clyde Doerr's band plays attractive syncopation, and in every minute way the hour is made completely enjoyable.

Headquarters

Is it some heavy timbers you need? Something about 30 x 30, and 120 feet long? Or piling up to 80 foot lengths? Perhaps just some crating lumber? Whatever it is, in any wood, size or amount, we can fill your order with no delay.

Our stocks of some 75 million feet in our Chicago yard of 45 acres are constantly maintained by our own mills operating in our own forests. Unequaled railroad facilities and a mile of waterfront give us shipping accommodations without equal.

In Chicago and suburbs, our own twenty branch yards mean quick deliveries and smaller delivery costs.

Wire us, phone us, write us for anything any time. Our facilities make us national headquarters for lumber.

Immigration and Know-Nothingism

SOME interesting figures on immigration and naturalization have been prepared by the United States Department of Labor, at the request of Senator Reed of Pennsylvania, on admissions and naturalizations based on the census of 1910. Senator Reed says his only objection to the 1910 census is that so many persons do not seem to understand why Congress should go back so far as is provided for in the Johnson-Lodge measure fixing the annual admittance at 2 per cent.

It is Senator Reed's idea that people who come to this country to be Americans should be given the preference. The census of 1910 shows that the following nations would be entitled to a quota of 5 per cent because more than half of their immigrants have become naturalized citizens of the United States:

Denmark, 69.2 per cent; France, 56.7; Germany, 72.8; Great Britain, 64.4; Luxemburg, 72.5; The Netherlands, 56; Norway, 67.3; Sweden, 69; Pacific Islands, 50.1, and Switzerland, 64.9.

Those nations whose percentage of naturalized American citizens falls below 50 and which would, therefore, be entitled to the smaller quota are:

Czechoslovakia, 45.8; Jugoslavia, 25.2; Austria, 37.7; Hungary, 29.1; Poland, 28; Finland, 41.3; Spain, 9.9; Roumania, 41.1; Greece, 16.8; Turkey in Asia, 25.1; Turkey in Europe, 20.2.

It seems to us that there are a great many people, especially among the employers, who have not given careful consideration to the question now before the country. Leaving out the matter of the necessities of the manufacturing plants, which is a minor consideration when compared with the interests of the general good, the main thing is to get a workable law which will admit those who wish to cast their lot with America because they are for American principles and because they wish to improve their condition.

We have no sympathy with know-nothingism.

Tax Reduction Progressing

FEDERAL tax reduction now appears a certainty. Some compromise between the Mellon Plan, which has the active and firm backing of President Coolidge, and the "substitutes" proposed by the Democrats and the LaFollette Radicals, has been suggested, but it is hoped will not become necessary. Tax reduction is steadily advancing.

A month ago the Mellon Plan appeared impossible. Many members of Congress declared it impossible, especially as they wanted the Bonus Act to come first. Senator Smoot was pessimistic. Within a fortnight Congressmen declared the bonus simply could not fail to take priority over tax reduction.

Yet the House of Representatives has given the Mellon Plan priority over the bonus, has refused to set a definite date for consideration of the latter, and Senator Smoot is now an optimist for tax reduction.

To the National Administration and to the people of the United States must go the credit for this situation, which has caused a large block of Federal Representatives to change their views.

Neither the Federal Administration nor the general public is in a humor to weaken in this matter; so, though the battle goes merrily on, Federal tax reduction now appears a certainty.

The I. M. A. Annual Meeting

THE twenty-sixth annual meeting of the Illinois Manufacturers' Association has come and gone. It was one of the most successful meetings ever held in the long list of annual conventions staged by the Association and was well attended.

The addresses delivered at the annual banquet were of more than ordinary interest and timeliness. Dr. Nicholas Murray Butler's statement that international controversies of the future must be settled by justice and arbitration rather than by force, voiced the general sentiment of his audience. The subject of waterways in the Mississippi Valley is one close to the hearts of manufacturers of the great Middle West, especially as high rail freight rates, coupled with low water rates via the Panama Canal, have taken much business from this section of the country. Representative Cleveland A. Newton's address was forceful and clear, and demonstrated beyond question the right and necessity of diverting from Lake Michigan into the Chicago Drainage Canal, and thence down the Illinois and Mississippi Rivers to the Gulf, of 10,000 cubic feet of water per second.

Art in industry is a subject to which too little attention has been paid; the business men of the country have been too busy to think along this line, but the address of Dudley Crafts Watson put another thought in the minds of those who heard him which should lead to many improvements in buildings and surroundings.

President Heidrich, who has given a fine administration during the past year, was honored by the Association by returning him for another year to lead the work of the manufacturers of Illinois. The installation of the new officers for the ensuing year was also of great interest and each was given hearty applause as he was introduced to the audience.

Farmer-Manufacturer Convention

THE thinking farmers of the nation—several hundred of them from thirty-five states—spent two days at the Congress Hotel this week at a Farmer-Manufacturer Convention under the auspices of the Illinois Manufacturers' Association.

They discussed immigration, marketing, advertising, transportation, waterways, legislation, taxation, foreign trade, the Constitution, socialism, cost of production, and other subjects which are just as vital to the manufacturer as they are to the farmer.

When they came to adopt resolutions, which, in a way, were a declaration of principles, it was discovered that there was not much difference in the viewpoint of the men who raise the grain and live-stock and cotton and the men who converted raw products (50 per cent of which come from the soil) into finished commodities of commerce.

Co-operation along constructive, helpful lines was the big idea of the Convention. And, better than anything else, the manufacturers and farmers, who had two luncheons and a dinner together, got acquainted and established an esprit de corps for future years.

The friendships made at this meeting and the familiarity with each other's point of view will be productive of far-reaching results in the interest of the two greatest industries of this country.

Permanent plans for the benefit of farming and manufacturing will be built on the splendid foundations laid at the Farmer-Manufacturer Convention.

Nation Building—For War or Peace?

International Controversies Must Be Settled by Rule of Justice or Force—Has World Learned War Lesson?

By **NICHOLAS MURRAY BUTLER**
President, Columbia University,
New York City, N. Y.

NATIONS, like individuals, are subject to moral laws and moral obligations nd should endeavor to live in peace with heir neighbors, in the opinion of Dr. Nich- las Murray Butler, President of Columbia University, New York City, who was one of e speakers at the Annual Dinner of the llinois Manufacturers' Association, held the Congress Hotel, Chicago, on Jan. 15. r. Butler is known the world over as an ducator, author and authority on politi- l economy, and in 1920 was the candidate the State of New York for President of e United States before the Republican ational Convention. The following ar- cle is an abstract of Dr. Butler's address efore the Illinois Manufacturers' Associa- on.—Editor's Note.

THE many and various problems that now vex and distress the whole world cannot be clearly understood unless seen in their relation to the age-long pro- ess of nation-building. These problems re all incident to the building of nations nd to the fact that nations, when built, nd themselves under the necessity of liv- ng together in mutual interdependence.

History records three different and dis- nct ideals of the world's political organ- zation. First of these is the ideal of a niversal empire under one dominion. This was the vision before the great mili- ary captains of the ancient world, and it was realized for centuries, so far as the Western world was concerned, by the rule of the Roman Empire.

Second is that which may be described as the ultra-nationalistic ideal of wholly eparate, competing, and often warring tates, each of which is dominated solely by self-interest and by a desire for terri- orial aggrandizement and material enrich- ment. This ideal, when attained, is at the ost of huge armaments on land, on sea, and in air. Industry, trade and commerce develop, as it were, on sufferance, and may be snuffed out in a moment like a candle by the stupidity of a government or the passion of a people.

Third is the ideal of separate and distinct nations, each of which is guided and con- rolled by moral forces and which seeks, hrough co-operation with other nations, to formulate rules of international law and conduct, to multiply the avenues and processes of travel, trade and commerce, and constantly to find ways and means of removing the causes and chances of international war and of extending the rule of that spirit of justice and concord which is the only sure basis of international peace.

It is perhaps not easy to define a nation, or even to describe it. Normally, a nation must occupy territory which has reasonable geographic unity; it must control adequate economic resources for its support; and it must rest upon that unity of tradition, race or religion which binds men together in so many ways. The migrations of men across Asia and Europe have been caused by the search for national homes that should be geographic unities and that should possess adequate economic resources. The Hispanic Peninsula beyond the Pyrenees is a typical geographic unity. So is Italy, bounded by the Alps on the North and on the other three sides by the Adriatic and Mediterranean Seas. The British Isles offer geographic unity, but not adequate economic support. This fact explains the history of the development of the British Empire and has made the British people a seafaring, a trading, and a manufacturing people who must import not only the greater part of the raw material for their manufactures, but the greater part of the food supply. The fact that Italy lacks coal and that Great Britain has coal to sell explains much of the trade relations and political sympathies that have so long existed between the British and the Italian peoples.

Dr. Nicholas Murray Butler

Unity Is Vitally Important

A large part of European history is to be explained by the roving and restless search of peoples for a geographic unity to inhabit which shall provide adequate economic support for a growing population.

Given geographic unity and adequate economic support, there remains the vitally important matter of unity of race or speech or tradition. This unity is never wholly gained but many peoples approach it in large measure. Where this unity is seriously lacking, there arises the problem of minorities such as have distressed and still distresses the nations of Eastern and Southeastern Europe and is represented among us by the Negro problem in the Southern and Southeastern States. Out of these conditions arise economic, social and political difficulties which have to do first, with the happiness or satisfaction of peoples themselves as regards their internal policy and, second, with those incidents of international competition and friction which, unless adjusted, lead to international war. It is easy to offer illustrations of all these conditions and circumstances drawn from the history of the last one hundred years.

If a people, in building their nation, come under the domination of that political philosophy which teaches that a nation is an end in itself, that it has no other aim than increase of power, wealth and population, then the nation so built must sooner or later be involved in wars of conquest against its neighbors. If, on the other hand, the people who build a nation are dominated by that philosophy which looks upon a nation, like an individual, as subject to moral laws and moral obligations, then the nation will not seek to aggrandize itself at the expense of its neighbors but will endeavor to live up with them in peace and steadily developing international relations of every sort. It is always true that a nation's foreign or international policy is built upon and is really a part of its internal policies and its dominating political ideals.

Must Rule by Justice or Peace

Differences between nations, like differences between individuals, will always arise. Such differences may be either composed by negotiation or by the intervention of a common friend, or they may be settled by the impartial application of the rules of international law and conduct or by force of arms on the field of battle. In the last resort there is no method of settling controversies between nations save through the rule of justice or the rule of force. The rule of justice means a body of international law and a court to declare and interpret it. The rule of force means war, with all its horrors and its devastations.

It still remains to be seen whether the fearful lessons of 1914 to 1918 have been learned by the modern world. If so, the outlook for international peace is assured.

If not, one must tremble for the life of civilization itself, for it could not withstand another such shock as the last.

License Fee Ordinances of Chicago Killed by Council

Chicago's City Council recently repealed a number of license ordinances which have been consistently opposed by the Illinois Manufacturers' Association on the ground that they were intended for revenue purposes only and that manufacturers and other business men are already taxed high enough without this additional burden. The license ordinances repealed were on the following occupations:

Advertising agencies
Publishers' representatives
Candy sales agencies
Commercial collection and claim agencies
Insurance adjusters
Employment agencies
Automobile sales rooms (this ordinance covered dealers in automobile accessories)
Wholesale mercantile establishments
Wholesale dry goods stores
Wholesale crockery, glass and glassware stores
Wholesale hardware stores
Wholesale paper and stationery establishments
Dealers in waste, cotton, wool and tailors' trimmings
Manufacturers of and wholesale dealers in pianos and other musical instruments
Manufacturers of and wholesale dealers in coffins and undertakers' supplies
Wholesale florists
Wholesale commission florists
Wholesale seed merchants
Jewelers
Retail merchandise stores
Dancing schools
Restaurants

Due to the effective work done by the Association, Governor Small vetoed a bill passed by the last Legislature which sought to legalize ordinances passed by municipalities that would make it possible to collect license fees based upon the number of employes.

C. R. Frederickson Heads Ohio Mfrs. Assn. for 1924

Charles R. Frederickson, President of the American Art Works, Coshocton, O., has been elected President of the Ohio Manufacturers' Association. Mr. Frederickson has been an active member of the Association since 1911, has been on the Board of Directors and last year was First Vice-President. Other officers elected were:

First Vice-President, George F. Dana, Cincinnati; Second Vice-President, Frederick M. Black, Newark; Third Vice-President, Charles R. Clappe, Toledo; Executive Secretary, Malcolm Jennings.

W. S. Elliott New Counsel for Harvester Company

William S. Elliott has been elected General Counsel of the International Harvester Company, to succeed the late Judge William D. McHugh, according to an announcement by Cyrus H. McCormick, Chairman of the Board. Mr. Elliott has been in the service of the Company for twelve years. He is 43 years old, was born at Jacksonville, Ill., graduated from Princeton in 1900 and Harvard Law School in 1903, and was appointed on the Company's legal staff in 1912.

Common Sense Immigration Law Needed; Revision of Present Act Is Essential

By HON. JAMES J. DAVIS

Secretary, United States Department of Labor

THERE has been some criticism of the Immigration Service and the Department of Labor because of the administration of the contract labor provisions of the immigration laws. It has been asserted that officials of the Bureau and the Department have so construed the law as to practically prohibit the importation of skilled labor under contract. The fault lies not in the administration of the law, but in the provisions of the law, which is probably as rigid and inelastic a statute as there is in our whole body of immigration law. It allows no discretion to any administrative officer, and its requirements are clear and unmistakable. In order that labor may be imported under contract two conditions must be met:

1—The labor must be classified as skilled labor.

2—It must be determined that labor of like kind cannot be found unemployed in the United States.

Both of these conditions are exceedingly difficult to meet. The question as to whether the labor sought to be imported falls within the classification of "skilled labor" is one which raises difficulties not easily understood by those unfamiliar with the law. Its determination requires efficient and expert officials, for applications for the importation of labor cover a range of employment as varied as the whole structure of American life.

The verification of the statement that labor of a like kind to that sought to be brought in cannot be found in this country, is a matter of painstaking and thorough investigation. When we consider the size of the United States and the extent and diversity of its industries, it is plain that in almost any given case it would be difficult to sustain the burden of proof as to this statement.

The iron-clad character of the contract labor law arises naturally out of the conditions which led to its enactment. It was written at a time when men and management in industry looked each upon the other with distrust, when hatred and strife were generally accepted as the natural attitude of employer and employe toward each other. There had been charges, more or less justified, that workers from Europe had been imported by employers to oust American workmen from their jobs, and to beat down the level of wages in American industries. There had been charges, more or less justified, that foreign workers had been imported to act as strike breakers. These and other evils led American labor to insist upon a law that would put an end to practically all labor importations.

We ought to have a common sense contract labor law that will operate for the best interests of both workers and management in American industry. Employer and employe are today realizing more than ever before the community of interests which exists between them. They know that if either is to succeed both must succeed, and that what injures one injures both. In the light of this growing spirit of co-operation between men and management, we should revise our contract labor law. I have talked with both employers and workers on this subject, and they seem to realize the need of reform in this direction.

It is clear that the importation of strike breakers should not be allowed. American employers and employes ought to be able to settle their own differences in the light of reason, without resort to force and the intervention of foreign elements.

We want all of the labor we need to keep American industry functioning at its highest efficiency for the benefit of both management and worker, as well as for the prosperity of the country generally. But we do not want a single worker more than we need. Our workers today realize that the lack of a single skilled worker may throw scores of other workers into idleness. They know that the true balance of labor in industry must be maintained. Employers, too, realize that nothing can be gained by maintaining a throng of unemployed at the factory gate, an incubus on the earning power of industry and workers who are taxed to support the idle worker. They know that cheap labor is the most expensive labor, and that cutting wages by a huge labor turnover is a burden on industry benefiting only the dictatorial straw boss and the venal employment agent.

It seems to me that representatives of American management and American workers might well sit down together and work out a contract labor law which would operate for the best interests of both, and to the detriment of neither.

S. M. Hastings Presides at Southern Ill. Costs Meet

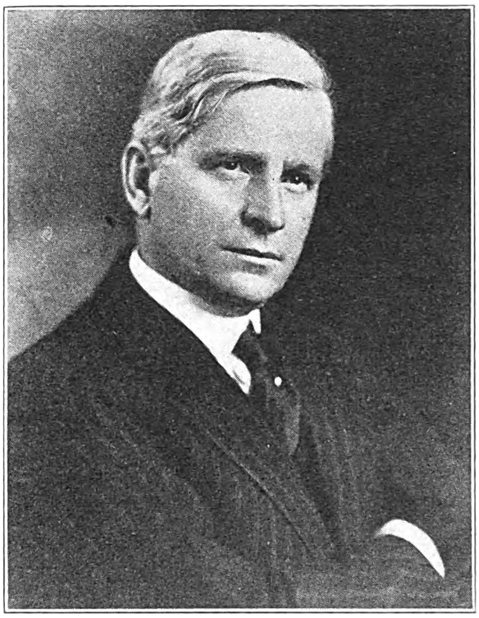
Samuel M. Hastings, President of the Dayton Scale Company, Chicago, and former President of the Illinois Manufacturers' Association, presided over the January meeting of the Southern Illinois Manufacturers' Costs Association, held at the Missouri Athletic Club, St. Louis, on Friday, Jan. 18. The speakers were Warren Sapp, in charge of plant accounting for Armour & Co., Chicago, on "Necessity of True Costs for Successful Management," and Arthur F. Barnes, Vice-President, Mercantile Trust Company, St. Louis, on "Reorganizations and Mergers of Corporations."

Marketing Products of the Farm

Greater Efficiency In Operation of Farms Essential; Present Selling Methods Satisfactory, Says Speaker

THERE is no subject of more importance or interest to the average farmer of to-ay than that of getting the products of his irm to market. Innumerable investiga-ons, both political and economical, have een made with the object of finding some ethods better than those practiced at pres-nt. Mr. White, head of one of the great-st packing concerns of the world, whose iterests are closely identified with those f the farmer and who has long been a areful student of economic and industrial onditions, handles his subject with thor-ugh knowledge of basic existing condi-ons. The following article is an abstract f his address on "Marketing the Products f the Farm," delivered on Jan. 15 before he Farmer-Manufacturer Convention, held nder the auspices of the Illinois Manufac-urers' Association, at the Congress Hotel, Chicago, and was one of many notable ddresses delivered at that two-day meet-ng.—Editor's Note.

By F. EDSON WHITE
President, Armour & Company, Chicago, Ill.



F. Edson White

AS a result of post-war readjustments, the farmer faces two equally important problems today. The first is connected with the efficient production of the different agricultural commodities—livestock, milk, grains, cotton, etc.—and the second with the disposal of these products at a price that will make his investment and labor worth while. Before the war, the greatest degree of attention was devoted to the production problem, but since the period of deflation began, the greatest interest has developed in the marketing side.

In order to make money in farming, crops must be produced as well as sold in the most efficient way possible. For three years, the country has been alive with the cries of farmers in distress; the livestock men, the cotton growers, the wheat growers and the range men successively facing conditions that seemed unbearable. So has also been the situation of a great many men engaged in industry and business, but this fact has been less advertised as recourse has not been taken to political pressure for special legislation to secure relief. There is no question, however, but what the economic status of thousands of farms is very poor.

The discovery, therefore, of what is really the matter with the business of agriculture is quite important. As is commonly charged, are the market agencies at fault in not paying a price which leaves the farmer a margin of profit over the cost of production? Or, does not the fault lie partly, at least in inefficient and non-plastic methods of farm operation?

The economic problem of disposing of products at a profit is quite similar for both the manufacturer and the farmer. In order to make money, the manufacturer must produce a commodity for which there is a demand corresponding to his volume of production; he must operate efficiently with the right kind of materials and machinery; he must keep his overhead expenses in line with the volume of his business; he must secure the right kind of a selling organization. Failure may result from deficiency in any of these items. It is possible to produce many commodities for which there is no particular demand, and it frequently happens that one may strike a market which is oversupplied and unable to absorb his immediate production. The manufacturer may struggle along, except in times of stress, with production and plant methods that are not up-to-date, with operating procedures that are inefficient, and with costs of production too near prevailing selling prices to admit of survival in the face of price depression. Finally, a manufacturer may invest in equipment far too expensive, in proportion to prospects of sale, or may show poor judgment in choosing the time and place for disposing of his goods.

The situation is much the same with the farmer. Regardless of what may be most practicable or most convenient for him, he must meet the same responsibility of producing in accordance with consumptive demand. We, today, face the situation of having so many hogs and so much wheat in national and international commerce that it is utterly impossible to find buyers who can be induced to pay prices profitable to the farmer. Furthermore, in the case of hogs, we find great numbers of them of thin inferior quality being shipped to market and being forced into trade with a most depressing effect on the few superior hogs available. It is inevitable that large volumes of agricultural products of a lower standard than consumptive demand requires will force prices to abnormally low levels in order that they shall be disposed of. The obvious answer to calls for better hogs is that the producer cannot take a chance, because of the high price of corn and consequent high production costs. But who is in position to say whether the total loss from lack of quantity is not as great or greater than the loss might result from feeding?

One must recognize and admire the splendid progress that has taken place in agricultural production in this country, but at the same time it must be admitted that the management of large numbers of farms is not nearly as efficient as it could be. Too many scrub sires are still in use, too many sows are weaning only one or two pigs, too many calves are stunted by lack of sanitation and poor feeding, and too many fields are so badly managed that they do not contribute at all to the farmer's income.

Farm Land Values Too High

Not all the difficulties of agriculture arise from this type of inefficiency. The fundamental difficulty in farming today lies in the over-valuation of land and equipment in terms of the income that may be received. Land is an increasing liability in exact proportion to the value at which it is held over what it can produce. Four hundred dollar land helps only the assessor, the tax collector, and the man who is collecting interest on loans, if the income really warrants only a $150 valuation. How many farmers are in trouble today because $250 to $400 valuations on their acreage have resulted in passing road bond issues, school bond issues, etc., which $150 land would never have suggested?

To complete the parallel with the manufacturer, the methods of marketing which the farmer employs must be of a type that will insure full success to his operations. In farm management and methods, in financing his business, and in marketing his products, the farmer cannot follow his individual fancies and ideas independently, with hope of profit. He must correlate every item in his business with that of his fellow producers, because his operations constitute an almost infinitesimal part in an enormous and widespread business, which can alone be successful when each individual, like a well trained soldier, contributes his part to the common end. Only when individual farmers are willing to submit to this discipline, will the efforts of the farm organizations, the Department of Agriculture, and the different nationally operating businesses which process and distribute farm products, assist the farmers in producing more business-like results.

The subject assigned to me for discussion at this meeting involves primarily the last mentioned item in efficient production; namely, the marketing of farm products. This is the feature in farm operations with which the farmers most commonly find fault, largely because it involves the activities of men and agencies other than themselves, who are easily exposed to criticism.

Years ago, the farmer usually sold his products directly to the ultimate consumer, one of the two parties doing the very necessary processing. Nowadays, the practice of the farmer hauling his products to town for peddling or local sale has well nigh disappeared over the greater area of the country. Instead, the road from producer to consumer has been improved, but made indirect, by a number of commercial agencies which perform a variety of services. The first path to the small manufacturing towns led from the surrounding agricultural territory, but today we find the channels of trade in agricultural products leading from one end of the nation to the other.

This improved transportation and distribution has permitted different sections of the country to specialize in particular crops or classes of livestock, to whose extensive and economical production they are well adapted. We thus get a wheat-belt, a corn-belt, a cotton-belt, fruit belts, dairy regions, hog regions and range areas, with many other specialized sections too numerous to mention. On the other hand, we find consuming centers, particularly in the industrial regions of the East, to which agricultural supplies, originating on distant farms, flow regularly.

Exports Complicate Marketing

Some of our most important agricultural products, furthermore, are raised in such quantities that a smaller or larger proportion must be marketed abroad. This is particularly true of wheat, pork, lard and cotton. Such a condition naturally complicates the process of marketing to a considerable degree, and also makes our national price level for these products dependent on economic conditions in the world at large. Our present tariff policy has a protective effect, so that it is possible to establish a price and wage level, and corresponding standard of living, which is a great deal above that of other countries. No foreign products which can seriously depress this level are allowed to enter this country without paying a tariff sufficiently high to operate practically as an embargo. As soon as we have a surplus to dispose of in countries outside our own protected boundaries we are forced to operate on the world price level and in competition with all other producers of the same commodities.

Unsettled conditions in Europe are not to blame for all our present export troubles. There are other causes why our products do not sell in all cases at a satisfactory price abroad. One reason is that we cannot produce a particular commodity as cheaply as other surplus producing countries, and that we, therefore, are handicapped in competition. Another cause of unsatisfactory trade is that our products are not of the exact quality and grade which is in greatest demand on the markets we supply. Outstanding examples of this last mentioned condition are our long-staple cotton exports and our British bacon trade.

Much discussion has developed in agricultural circles over the fact that the quotations on American bacon are regularly much lower than those on the bacon produced by our competitors. In fact, the prejudice against American bacon in England has been developed to such a point that many stores display signs in their windows advertising the fact that there is "no American bacon sold here." This dislike for our bacon reached a critical point at the close of the war when the British Food Ministry bought and stored great quantities of American pork (prepared for early consumption), which deteriorated excessively before it reached the ultimate consumer. Despite this aggravating fact, however, we must admit that we do not produce in this country uniform quantities of bacon of the particular type which the British prefer and for which they are willing to pay a high price.

If we are to capture this high class trade, we must take such measures as will secure an export quality of bacon which will equal or excel the products of other countries. There is nothing in the American trade demand to indicate that for the next generation our pork supply will be based on other than the best type of butcher hogs, but it would be a wise thing in suitable farming sections to produce sufficient quantities of English-type bacon to dominate our surplus for export. We would thereby receive higher prices for our outgoing bacon goods than we do now, and the producer would share in this reward. Furthermore, our international trade balance would be favorably affected, a most welcome contribution to our international stability as the financial dominance we held at the close of the war gradually diminishes.

Processing Affects Marketing

Second to this feature of distribution in the present day marketing of agricultural products is the fact that practically everything coming from the farm must be graded or processed before it reaches the ultimate consumer. In the old days, much of this was done at home or in small local shops, and the cost was in labor rather than in cash; but today, due to the nation-wide scope of business, most of this processing is done by large concerns in central plants.

A third characteristic of present day marketing is the storage problem. The demand for most agricultural products is fairly uniform throughout the year, but the transfer of the supply to the public markets is primarily limited to short periods. The bulk of the grain is harvested within a few months, while cotton and almost all other feed and fiber crops occupy an even shorter period. The run of livestock also is unevenly distributed over the year, the cattle and sheep from the range, for instance, arriving on the market in the Fall, and those from the feed lots in the Spring. Similarly, hogs develop two seasons of excessive runs—one from December into March, and the other from May into early July.

Although it is possible, to some extent, to regulate production in accordance with demand, still it remains one of the important and difficult tasks in marketing of agricultural products to make the necessary provisions for storing and distributing the products evenly over the year. This process not only requires large amounts of capital, but also involves a speculative element due to the necessity of buying on the basis of prices expected to develop in the future.

It is apparent from what has been said of the characteristics of modern marketing that the road from the producer to the consumer has been lengthened considerably in recent years. This condition is partly due to the evolution of the economic structure of the country, but it has been accentuated by the more exacting requirements of the consumer for a high-grade and expertly processed produce delivered at his house with the least expenditure of effort on his part. The services of large numbers of agencies and men are required to attain this result, each of which involves a separate cost and the total of which becomes a very impressive item in the consumer's price for the finished product. The most important requirement in marketing, viewed by the producer as well as the consumer, is that the road from the one to the other be as direct and economical as is consistent with a wide-spread, efficient and high-quality service; such as, I believe, may justly be credited to concerns like the large packers, with nation-wide operating facilities.

The first problem in a direct and economical service involves the transportation from the farm to the first place of sale. Generally, this includes hauling and railroad transportation. It is a fundamental fact in our national agricultural economy that transportation costs may provide the differential factor in the competition between the various producing sections of the country. Transportation costs, next to the productive nature of the soil, are basic in determining land and product values in the different states. It, therefore, frequently happens that transportation costs become the limiting factor in determining the type of agriculture to be followed, and the present agitation among farm organizations for lower freight rates is explainable on this basis rather than on the basis of an ingrained hostility to railroad earnings. The ideal freight rate is the lowest one consistent with efficient transportation

How to Build Industrial Production

Co-ordination of All Departments Needed for Success; Strong Sales Organization and Policy Are Essential

By **W. A. LAYMAN**

President, Wagner Electric Corporation, St. Louis, Mo.

THE following article is the first of two installments of an address recently delivered by W. A. Layman, President of the Wagner Electric Corporation before the Southern Division of the Illinois Manufacturers' Costs Association, meeting at the Missouri Athletic Club in St. Louis.

I.

THE functions of a manufacturing company, such as that with which I am identified, naturally arrange themselves into three distinct divisions:

a. Distribution or Sales,
b. Manufacture or Production,
c. Financial and Accounting.

Your Chairman has asked me to speak particularly upon the production phase, but preliminary to doing so, permit me to make brief reference to the other divisions very essential to, and closely allied with, production.

No great industrial production enterprise can be successful without a strong sales or distribution organization. An industry may create and produce splendid and widely needed devices; it may be organized internally with every provision for production in volume at low cost; and yet may languish and die because of weak and inadequate sales organization and sales policy.

Some of our greatest industrial enterprises—of which the Ford Company is an example—are popularly supposed to be so successful because of extraordinary genius and efficiency of production methods. I think it will be found to be true, quite generally, that outstanding internal efficiency in such institutions has been possible by a greater genius, or at least a preceding success, in sales exploitation. From its inception until the business depression of 1920-1921, the sales of the Ford Company so constantly exceeded productive capacity, that internal pressure always prevailed upon the factory organization for greater quantity of output. An ever expanding combination of excess volume of sales at a profit made production efficiency not only imperative, but almost inevitable.

It may be added also that very aggressive sales policies avoided possible financial embarrassment to the Ford Company during the depression of 1920-21. You will recall the report then current that the Ford Company then found itself in need of substantial additional cash sums. Many industrial institutions at that time were in a similar position and looked to their banks for financial support. The Ford Company inaugurated a great sales campaign for the liquidation of its heavy inventory, and not only were bank loans avoided, but also manufacturing embarrassments, by this process of internal liquidation.

May I set the stage for my remarks on production by assuming that the manager of the industrial institution has the distribution division well organized, and therefore has no sales distribution problems to worry him; that, on the contrary, he has the background of an adequate and continuous sales demand upon which to build a production organization and production facilities which exemplify, in a reasonable measure, those ideals of good management which we all seek to establish in our various companies.

Let me further assume, for the purpose of this discussion, that the financial and accounting division of the business is strongly organized. In a large industrial institution, the head of this division would be the Comptroller, reporting direct to the President or Manager. Under the jurisdiction of the Comptroller would come the Treasurer (whose principal duties center around the matter of credits and collections) and the Auditor (whose jurisdiction would extend to all accounting problems of the company). In a small business, the financial and accounting operations would be divided between a Treasurer and an Auditor, both reporting direct to the President of the company.

In either a large or a small business, the system of accounts should be so arranged that detail factory costs tie into the general ledger of the company in such a manner as to permit of a monthly balance sheet and operating statement—these to show profits or losses by class of apparatus, and thus to be an effective means in the hands of the President or Manager for constant production control.

A Business Weather Vane

In general the financial and accounting division of the business must carefully and accurately sense the commercial tendency not only of the business itself, but of the times in general. It should be the weather vane of the institution, injecting the element of restraint as the suggestive premonitions of trade recession appear on the commercial horizon, but with equal readiness and facility encouraging adequate financial preparation for a dawning prosperity.

Coming down to the question of direct plant production, I feel that sound organization policy dictates the placing of full responsibility for production on the shoulders of some one executive officer of the company. Such an officer should be responsible for controlling the following departments of production work, all of which require expert ability and must be co-ordinated closely if satisfactory results are to be obtained at minimum cost. By satisfactory results, I mean constant delivery of the product in accordance with schedules agreed upon in the distribution division; a quality of production which will at no time create sales resistance; and low cost of production permitting successful competition in the market:

1. Engineering and Design;
2. Scheduling or Planning (sometimes popularly called Production Department);
3. Direct Manufacture, controlling all manufacturing operations and labor employed;
4. Inspection.

Each of these departments should, of course, be under a divisional chief. In a business sufficiently large to justify it, the scheduling and manufacturing departments should be combined under the direction of a general superintendent.

Without attempting to go deeply into particular forms of procedure, may I deal with the several phases of production above referred to from the standpoint of the executive in charge, pointing out some of the guiding principles which experience and observation have indicated to me as very essential to satisfactory results:

ENGINEERING AND DESIGN—It should be the duty of the Engineering and Design Division to provide the scheduling, manufacturing and inspection divisions not only with complete designs, but also with complete specifications for each of the various articles of manufacture. These specifications usually take the form of a bill of material on which is listed the drawing numbers of all parts entering into the article, the kind of material used for the part, and the quantity of rough stock per unit.

In these days when interchangeability of parts for any device is necessary for replacement and repair, drawings listed on such specifications should carry commercial working limits which are possible of attainment. In our company we emphasize the requirement that working limits should be commercial, for the reason that working limits unwisely rigid often involve excessive first cost of operations and an excessive amount of scrap produced.

Creative Design Work Necessary

It is upon this point that the executive officer in charge is very frequently called upon to make decisions as between conflicting recommendations of Chief Engineer, General Superintendent, and Chief Inspector which determine the cost of manufacture and the commercial quality of the article produced.

In addition to the responsibility for providing specifications for the article in current manufacture, the Engineering and Design Divisions of every important industrial institution have the problem of creative design work. The original devices or products which constitute the foundation on which most businesses are built require continuous engineering and design evolution, if the institution is to maintain its vitality. The pace of modern advancement, the continuous necessities for anticipating shift in the character of trade demand, and the avoidance of complete obsolescence of product, compel the maintenance of a strong creative organization. The great businesses of the country are constantly looking so far ahead that many industries have always in hand new products fully developed and ready for introduction into manufacture as and when the tides of public demand make the injection of new products necessary.

Upon the Engineering and Design Departments also rests the responsibility of passing on changes in design and manufacturing methods which may be initiated either by themselves or other departments of the business with a view to effecting cost reductions or improvement of product. Such changes usually involve the obsolescence of certain parts in process or manufacture and raw material on hand and provision for the disposition of such parts and material should be made at the time such changes are authorized and receive final approval of the officer in charge of production in order to keep the inventory on a sound basis.

SCHEDULING OR PLANNING DEPARTMENT—In most manufacturing institutions the factory is called upon to produce two general classes of output:

a. Standard apparatus (which is subject to packed stock allowance and to more or less continuous production activity).
b. Special apparatus (which may or may not embody parts of standard manufacture).

Standard production can readily be handled by the establishment of stock allowances not only on the raw materials entering into the product, but also on parts which may wisely be carried in stock as such and drawn upon to complete the assembled articles of which they form a part. It is the duty of the Scheduling Department to place requisitions for the purchase of all raw materials required, and specify on these requisitions the necessary delivery dates at the plant. It is also the duty of the Planning Department to place work orders for manufacture of such parts and finished apparatus as are subject to stock allowances.

These work orders should carry on their face the quantity required, amount of raw material required, the drawing number or specification to which the apparatus is to be built, the proper account number which it is assigned by the Accounting Division and the names of the various operations and departments performing the work. It should be understood that in a well-organized plant, absolutely no work can be performed without a production order.

The Accounting Division should maintain classified store ledgers readily accessible to the Planning Department. Such a record should show for each item, the amount on order, amount received, amount reserved for particular orders, quantity available, values, etc. This record should be subject to constant physical check and, therefore, give a reliable perpetual inventory value of stores. Such a record should insure adequate material supply, which is vitally essential to successful production.

Conference on Special Work

For all special apparatus, the Planning Department should receive from the Engineering Department a complete specification, and upon its receipt should call into conference a representative of the Accounting Departments, the Division Superintendent directly responsible for the manufacture, the master mechanic, and a representative of the Inspection Department. In this conference committee meeting, the specification should be examined, part by part, and after the Scheduling Department has made the delivery requirements and quantity to be made, an operation sheet should be prepared for each part on which is shown the various manufacturing and inspection operations required to complete the parts according to the drawings. When these operations are laid out, the necessary jigs and fixtures should be decided upon, and, where standard fixtures cannot be used, requisition should be at once initiated for the special fixtures required.

At this point, the character of the fixture—that is, whether for permanent use, and hence relatively expensive, or for temporary use and relatively cheap—should be agreed upon, and dates when needed determined. Having thus decided when, where and how the equipment essential to this special product is to be made, it becomes the duty of the Planning Department to place all the necessary work orders and arrange through their follow-up system to see that all time schedules are met as nearly as possible. Also, to make provision that when time schedules are not met, special measures are to be initiated for overcoming the delays that have been incurred. Men on follow-up work should have initiative and ingenuity, and an ability to deal with all classes of people, as they will be thrown in contact with all types, from officials of supplying concerns down to railroad switchmen in congested freight terminals.

(The concluding section of this article will be published in MANUFACTURERS NEWS in the next issue of Jan. 26.)

Over 230,000 Farmers Lost Farms Since 1920, Says U. S.

More than 8½ per cent of the owner-farmers in fifteen corn and wheat producing states lost their farms with or without legal process between 1920 and the Spring of 1923, the United States Department of Agriculture has learned through a special inquiry to which 2,400 farmers in the Upper Mississippi Valley replied. In addition, more than 15 per cent of the owners were in fact temporarily insolvent, but held on through the leniency of creditors.

The 2,400 farmers, each reporting for a specified area, made returns on 69,000 owner-farmers. It was shown that of these owner-farmers 2,800 lost their farms through foreclosure or bankruptcy; 3,000 lost their farms without legal process, and 10,400 farmers held on through the leniency of creditors.

Of 26,000 tenant-farmers in the areas covered, 1,900, or more than 7 per cent, lost their property through formal proceedings; 2,000, or more than 7 per cent, went under without legal formality, and 5,500, or more than 21 per cent, were spared such losses only through the leniency of creditors.

Applying the percentages of losses obtained in the inquiry to the 1920 census figures for owners and tenants in the States covered, it is estimated that out of a total of 2,289,000 owner and tenant-farmers, more than 108,000 lost their farms or other property through foreclosure or bankruptcy; over 122,000 lost their property without legal proceedings, and nearly 373,000 retained their property through the leniency of creditors.

U. S. Farm Organizations Do $2,000,000,000 Business

More than $2,000,000,000 of business was done by farmer business organizations in 1923, according to estimates made by the United States Department of Agriculture. The estimates are based upon reports from 6,639 organizations which did a total business of $1,200,000,000. Reports have been received from 8,313 associations and additional reports are yet to come in from approximately 2,000 organizations.

Of the 8,313 organizations reporting, approximately 90 per cent were primarily engaged in selling farm products, and about 10 per cent in the collective purchasing of farm supplies. Grain marketing organizations comprised more than 30 per cent of the associations; dairy products 22 per cent; livestock 14 per cent, and fruits and vegetables 11 per cent.

Two thousand six hundred grain organizations did a total business estimated at $490,000,000; 1,841 dairy products organizations a total business of $300,000,000; 1,182 livestock shipping associations a business of $220,000,000, and 956 fruit and vegetable associations a total business of $280,000,000. Seventy-eight cotton cooperatives did $100,000,000, and fourteen tobacco organizations $132,000,000.

Mexican Trade Meet Postponed

The trade conference, scheduled to be held in Mexico City Feb. 11 to 15, under the auspices of the American Chamber of Commerce of Mexico, has been indefinitely postponed on account of the present unsettled conditions in that country, according to an announcement by William Flewellyn Saunders, Secretary of the Chamber.

Public Demand Wins For Tax Relief

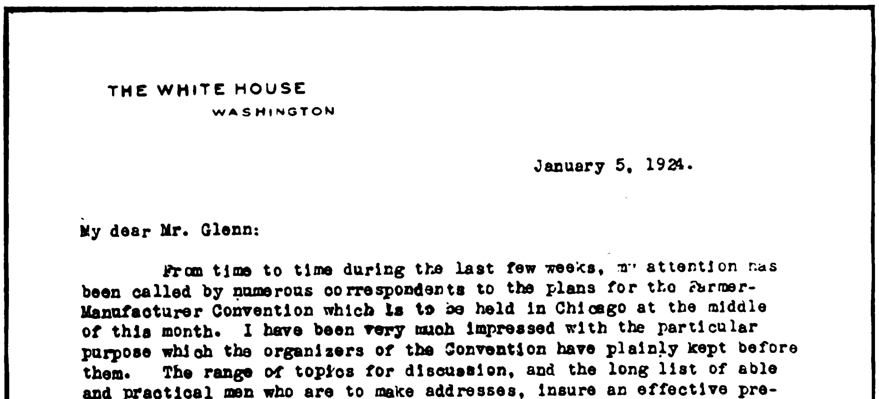
Congressmen Convinced Opposition to the Mellon Plan, In Favor of Bonus, Would Jeopardize Own Re-election

By JOHN M. TOWNSEND

Washington Correspondent, Manufacturers News

Washington, D. C., Jan. 16—Victory for the administration forces in the Republican House conference on the Tax Reduction and Bonus Bills, while won by a narrow margin, nevertheless tands out as the most mportant achievement or the new leadership in he House this session. While keeping aloof from vielding the big stick or ringing pressure to bear n individual members of Congress, the tactics and trategy pursued by President Coolidge went far oward bringing this issue o a successful conclusion n the first open test ween the tax reductionists and the bonus advocates. While the fight is not yet concluded for all time at this session, nevertheless the Administration and the House leadership have joined hands in repulsing the first attack in a way that is encouraging, at least.

COOLIDGE TAX TACTICS—"Be sure you are ight, then go ahead" sums up in one sentence the tactics of President Coolidge in forcing the issue on tax reduction in this Congress. While Congressmen who favor bonus legislation over tax legislation, or, favoring tax legislation, object to certain details of the Mellon Plan, complain about "propaganda" in favor of he Administration program, the fact remains that the constant reiteration of the merits of the Mellon Plan by the President and Secretary Mellon has so far captured the support of the country that Congress can no longer resist the demand. The victory of the Administration forces in the House conference, not only assuring completion of the Tax Reduction Bill before a Bonus Bill can be taken up, but declining o fix any time for consideration of bonus egislation by the House itself, marks a urnover of at least fifty Republican votes n the House from immediate bonus to immediate tax reduction legislation. Not only has the President remained firm in his demand for tax reduction legislation in accord with the principles of the Mellon measure, but that very firmness has won him such support throughout the whole country as to convince many of the House Republicans that he will be unbeatable for the presidential nomination in the Republican National Convention next year. The gain in Administration support in the House on this issue represents this conviction on the part of members who frankly say they would jeopardize their own chances of re-election next year if they opposed the President and the popular demand for tax reduction in their districts at this time.



THE WHITE HOUSE
WASHINGTON

January 5, 1924.

My dear Mr. Glenn:

From time to time during the last few weeks, my attention has been called by numerous correspondents to the plans for the Farmer-Manufacturer Convention which is to be held in Chicago at the middle of this month. I have been very much impressed with the particular purpose which the organizers of the Convention have plainly kept before them. The range of topics for discussion, and the long list of able and practical men who are to make addresses, insure an effective presentation of the supremely important idea of real cooperation among the varied interests of the nation. It is perfectly apparent to all of us that we shall not have real and permanent prosperity for the whole country, nor for the greater part of it, so long as any large and vitally important section of its productive industry is unable to prosper. The plight of the farmers in recent years has been and will continue, until we find means of relieving agriculture, a menace to the prosperity of every other element in the community. It is most gratifying to know that such vigorous and intelligent efforts as this Convention represents are being directed to enforce realization of the full situation. A correct diagnosis is the first preliminary to remedying any grave disorder. Your Convention, with its central purpose of true cooperation among the business elements, is an evidence that the right diagnosis has been found, and that alone is occasion for great encouragement.

I have wished that I might have the privilege of being present at some of the sessions of the Convention, but this has been found quite impossible owing to the requirements of public business here, so I am writing to express my hope for the complete success of the gathering.

Very truly yours,

Calvin Coolidge

Hon. John M. Glenn,
Secretary, Illinois Manufacturers' Assn.,
76 West Monroe St.,
Chicago, Illinois.

A MESSAGE FROM THE WHITE HOUSE

President Coolidge Extends Felicitations to the Farmer-Manufacturer Convention in Chicago

TAX BATTLE ONLY BEGUN—While there is still no change in the tax fight in the House relative to the determination of all parties and blocs to vote a heavy tax reduction in favor of the small, earned-income taxpayers, the fight has only begun over the details of the tax bill which is to be enacted. The Mellon Plan still represents the cleanest cut, most scientific and logical measure before Congress for consideration. Behind it the President stands firm as to its general principles. The Democratic substitute indorses, for the most part, the changes in administrative features proposed by the Mellon Plan, but advocates a further reduction in the lower brackets of income and a maximum surtax of 44 per cent based on incomes in excess of $54,000. Likewise, the LaFollette program in the House proposes even greater relief for the small taxpayers, a retention of the surtaxes on higher incomes as at present, an increase in inheritance taxes and on gifts and taxation of stock dividends and excess profits, besides legislation to forbid the further issue of tax-exempt securities. The Farm Bloc group has contented itself with offering to accept a surtax maximum rate between 37 and 42 per cent.These proposals, together with the suggestion in Democratic quarters that enough revenue ought to be raised to provide tax reduction as well as to pay the bonus bill, indicate that both the Democrats and the LaFollette group, at this time, have in mind a shifting of the burden of taxation on the rich in such a way as to produce more rather than less revenue from that quarter. This raises the question at once whether or not their plans are not in violation of the fundamental principle of the Mellon Plan relative to the release of new capital for industrial and trade purposes. So convinced are many Democrats of this fact that they are reading the last Democratic National Platform to the Democratic members of

Congress, the tax plank of which pledged that party to reduce taxes in such a way as to put an end to the investment of capital in tax-exempt securities by encouraging it to go into productive enterprises. Furthermore, the political leaders of the Democratic party, who are watching the effect of the tax fight in Congress on the next presidential election, are utterly opposed to any amalgamation between the Democrats and the LaFollette group, but are in favor of a compromise with the Administration forces, as far as possible, so as to take the tax reduction issues out of the campaign. This group of Democrats is convinced that there will be tax reduction at this session of Congress and that their party, after making its record in accord with Democratic principles, should then swing in and vote for the bill.

LaFOLLETTE GOES OVER—When Senator Robert M. LaFollette led Senator Brookhart, the two Non-Partisan League Senators and the two Farmer-Laborite Senators from Minnesota, into the Democratic camp this week and elected Senator Ellison D. Smith of South Carolina Chairman of the Interstate Commerce Committee over Senator Albert B. Cummins of Iowa, he brought some fear and trepidation to the Democrats with him, a great deal of chagrin to those Democrats who want no alliance with him and he helped the Republicans demonstrate to the country, that, for partisan purposes, this group cannot be relied upon to help the Administration on any real issue involving taxation, bonus or transportation legislation. If there is any lesson contained in the LaFollette move it is that no conservative legislation along the lines the President has recommended can be passed unless conservative Republicans and Democrats join hands to enact it; that unless this is done all legislation of this session will either be the result of compromise between radicals and conservatives of one or all parties, or will be defeated in the absence of such a compromise. While the election of Senator Smith gives the Democrats and radical Republicans control of the Interstate Commerce Committee, nevertheless that control, if it amounts to anything, must result in a compromise between the LaFollette group and the Democrats. It does not mean that LaFollette can have all he wants done to the Esch-Cummins Transportation Act. While the Committee has ten Republican members, of whom four go part way with LaFollette, at least two out of the seven Democrats will not follow him at all. These are Senators Underwood and Bruce, and others are doubtful on some of the radical LaFollette proposals. In any event the Committee is close and, so far as the Senate is concerned, the question again arises whether the big issues of the session are to be settled on a partisan basis, by combinations or on a non-partisan basis. If the radicals and conservatives ever divide on that basis there is no question as to the outcome in either house.

SHIPPING BOARD ROW AVERTED—After having, as he thought, reached an agreement with the Shipping Board last week whereby a separation of the duties of the Board from those of the head of the Emergency Fleet Corporation was to be accomplished in such a way as to give Rear Admiral Leigh Palmer absolute control over the operation of the government-owned merchant marine, President Coolidge found early this week that the Shipping Board was balking at passing the resolution proposed to carry out the President's plan. The Board labored on the resolution for four days in executive session and finally reported to the White House that the resolution could only be passed if modified. The President was not satisfied with the exact wording of the resolution but consented to permit the Board to retain the authority to discharge the head of the Fleet Corporation, retaining for himself the inherent right to "fire" the Shipping Board whenever necessary.

Relation of Farm Income to Values; Striking Results of Inquiry by U. S.

HOW incomes from farm lands are related to farm land values has been worked out by the United States Department of Agriculture from data collected in the census of 1920. It is believed the results of this study will be of considerable practical benefit to farm owners and farm tenants, and also to investors in farm mortgages. Land income should not be confused with the farmer's total income. It is only that part of the total farm income which is received from the land.

One of the most striking results of the industry is the variation shown to exist between the proportion borne by farm rents to land values in different parts of the country. In Iowa, for example, cash rents were only 3.2 per cent of land values, compared with 5.6 per cent in Ohio. Rents in the more recently developed agricultural states are generally considerably lower in proportion to land valuations than in the older farming sections. Land values generally have increased faster than rents.

This is due, say department economists, to the fact that land values are based not only on actual present income but on expected increases in that income. In the older states, the period of rapid expansion in farm income has passed, and valuations are almost exclusively capitalized current earning power. Rents in these states constitute a relatively high annual return on land values, because the latter do not include any material allowance for anticipated future increase in farm income.

In States where a large percentage of the value of farm land is based on expectation of future increase in farm land income, rents constitute a relatively small current return on the valuation. In Iowa, the ratio of rent to land value has only averaged 3½ per cent since 1910. The ratio in Eastern Nebraska and Southeastern South Dakota in 1920 was only 2.2 per cent. In Southern Minnesota it was only 2.1 per cent. These rentals, when compared with the 5½ per cent interest charge commonly demanded on farm mortgages, show that the current income from land in rented farms in the states in question was considerably less than what might be considered a fair return on the capital value of the farms.

It is revealed, in short, that the ratio of rents to land values for any one year does not show the rate at which land incomes, current and prospective, are capitalized. Nor does it show the percentage return received by the land owner on his investment in the long run. What it shows is the return obtainable by the landowner out of current earnings. If he sells his land he can get, in addition to this current return, a sum representing the capitalization of his prospects of increased future income.

When land values are rising, their value at any given time is higher than the capitalization of their current earnings, and it is this fact which explains the apparent discrepancy between rentals and interest rates on mortgages in the rapidly developing agricultural States. In other words, a low percentage of return on the valuation of land in a given year is to be explained for the most part by a relatively high anticipated increase in income.

It is noted that farm tenancy is greatest where land values have been increasing most rapidly. There is a considerably larger percentage of tenancy in Iowa, for example, than in Ohio and Indiana. This is believed to be due to the way the land values are made up, rather than to their absolute amounts. Where the valuation is based on large expected increases in earning power, rather than on actual current earning power, tenancy gains because the purchase of land at prevailing valuations involves interest charges exceeding the current return. This does not necessarily mean that buying would be an unprofitable investment in the long run. Economists believe, however, that it does suggest the possibility of encouraging land ownership by a policy of graduated interest payments, under which the annual charges would rise with the rise in the income from the land.

Variations have been found to exist between the farm rentals paid by white and by colored and Japanese tenants, but it is thought these differences do not actually indicate any modification of the fundamental laws of farm rent. Negroes, it is pointed out, pay more rent than white tenants because they usually need considerable supervision from the landlord. For this supervision the landlord receives a wage or fee concealed in the rent. The Japanese are required to pay more rent than white tenants as a premium to set aside the prejudice against letting farms to them. They make up the difference by putting in longer hours and working their children harder than white farmers ordinarily do.

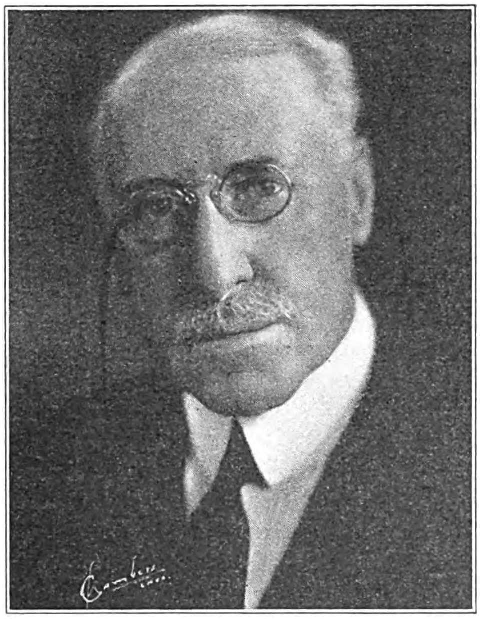
Plea for a Sane Income Tax Policy

Consumer Pays Levy Heaped on Industry, While Capital Seeks Tax-Free Securities—Supports the Mellon Plan

LEXANDER H. REVELL, Chairman of the Board of Alexander H. Revell Co., Chicago, manufacturers and retail- of home and business furniture, etc., d a member of the Illinois Manufac- ers' Association, recently sent a letter to ry Senator and Representative in Wash- gton supporting the Mellon Tax Reduc- n Plan. With the letter he enclosed a tement setting forth his views of the tter, with arguments supporting the Mel- Plan. Attached is Mr. Revell's state- nt in full.—Editor's Note.

By **ALEXANDER H. REVELL**

Chairman of the Board of Directors,
Alexander H. Revell & Company



Alexander H. Revell

SENATOR HIRAM JOHNSON, in his Cleveland, Ohio, speech of January 3rd, attacked the Mellon Tax Reduction Plan, if quoted correctly, in the fol- wing manner:

> "The concern of this tax scheme is not for the an of small income who can least bear the bur- n, but the concern is for those of large incomes o can best bear the burden." * * * * *

It is apparently the Senator from Cali- rnia's aim to aid the man of small means freeing himself of a portion of the tax rden which now drains his pocket-book -an aim with which no sane man will uarrel. Viewed in such a light, however, e opening sentence of the extract just uoted may be criticised severely.

The Senator has launched a subtle plea r the support of the average voter who dissatisfied with existing taxes, but his nowledge of economics is either willfully r unintentionally faulty.

To begin with, all taxes are paid either irectly or indirectly by the consumer. o adequate means of assessment has yet een devised, nor is it likely that there will e, which will prevent the great bulk of the ederal, state and municipal taxes being assed along by the industries upon which hey have been originally levied.

Let us trace the course of a tax as an xample:

A tax is placed upon the plant, good vill, or income of a wholesale manufac- uring concern. The added expense is com- uted in the cost of production and added, herefore, to the wholesale price of every rticle manufactured.

The increased wholesale price of the article is absorbed temporarily by the jobber, only to be passed along with his own increased expense through taxation to the retailer.

The retailer has his own tax levies to meet on his store, his stocks of merchandise, and, indirectly a portion of the landlord's through increased rent. The retail price, therefore, is a composite of all these increased costs which the merchant must meet or retire from business.

So the customer—the consumer—pays them all.

Consider, too, the effect of income taxes placed upon the industrial plant.

The investor demands a higher yield for his money in order to meet his own increased taxes. If he does not get his rate, the funds go into tax-exempt, or nearly exempt, securities.

Faced by this competition, the market values of the stocks and bonds of the corportation fall until they represent a satisfactory return. Or, if the concern is so fortunate as to be able to do it, the operating profits are increased to the point where the securities may be maintained at par through the payment of a higher interest yield and thus offset the advantages of the tax-exempt issues by municipal, state, and federal agencies.

Either the credit of the company must be impaired or the dividend rates must be marked up. There is no other alternative.

It is apparent that in either case, the result must be higher prices to the customers of the concern—increases which are passed along and pyramided, as I have already outlined, to the ultimate purchaser of the article, be he millionaire or taxi driver.

The effect of taxation upon rents has been hinted at. As the man of small income is, in most instances, a tenant, it will be well to analyze this phase to a greater extent.

He who lives in a rented house or apartment must necessarily pay a rental that includes the taxes paid by the owner. As the tax rate increases, the rental rate must be advanced to cover it. There may be exceptions, but they are rare.

The only widespread reversal of this rule might come through a large surplus of living quarters. In such a case the owner would lose the income from his rentals. Capital, however, would no longer be attracted to the construction industry and building would halt until the increase in population compelled a return to more just rentals from the investor's viewpoint.

Such a surplus, however, is out of the question for many years to come. Despite the tremendous building activity of 1922 and 1923, the National Association of Real Estate Boards, in a recent survey, found only one center of population with a surplus in any type of living quarters. That center was New York City and the surplus existed only in expensive residences and apartments. The man of moderate means, whom Senator Johnson seeks to benefit, is as badly off as ever, and helping to pay his landlord's taxes in full.

Consider the existing taxes from still another angle.

Taxes on Big Incomes Popular

The levies against large incomes, simply because they are large, has won a great deal of favor in the minds of some who at the same time are opposed to the existing social order and seek revolutionary panaceas as remedies.

This theory has driven large incomes into the tax-exempt security field with a vengeance. In 1922 the most careful estimates indicate, 19.6 per cent of all national wealth was exempt from taxation. Of this, 12.9 per cent, or $33,600,000,000 was in exempt property other than real estate. The bulk of this it is fair to assume, was in tax-exempt securities.

Figures compiled by the National Industrial Conference Board from Federal sources, show that in 1916, the Bureau of Internal Revenue received 1,742 returns scheduling incomes of more than $300,000. In 1921, only 246 returns in this class came in.

In 1916, the Federal Government derived nearly $1,000,000,000 in revenue from this income group; in 1921, only $153,000,000. The decline was nearly 90 per cent.

Even after allowing for the effects of the post-war deflation the drop is a startling proof of the growth in favor by tax-exempt securities among the rich—a situation which leaves the man of comparatively moderate means to meet the tax bill of the nation.

These huge incomes were formerly available for investment in the securities of new

(Continued on page 21)

TRANSPORTATION

Federal Control of Railroads Has Cost Government $1,696,000,000 To End of 1923, Says Director General Davis

IT cost the United States Government $1,696,000,000 to take over and operate the railroads of the country during and after the war, according to James C. Davis, Director General of Railroads, in a report submitted by him to President Coolidge covering the period of Federal rail control to Dec. 31, 1923.

Since the carriers were turned back to the owners, claims for compensation have been paid by the Government amounting to $763,106,521. Tentative agreements, looking toward final adjustment, are included in this amount. These settlements cover 99 per cent of all the mileage taken over and actively operated by the Director General.

Assets of the Railway Administration are set down at $645,161,766, while obligations are placed at $308,237,900, this latter amount bearing 6 per cent interest. As important claims requiring large cash expenditures have been adjusted, receipts from interest on these obligations and collection of assets in the field should be more than sufficient to liquidate and adjust all outstanding claims growing out of Federal control, including all overhead, and from January 1, 1924, the Railroad Administration will be an income producing asset of the Government instead of a liability, according to the Director General's report.

Shipping in Mexico Normal

Officials of the National Railways of Mexico, operated under the Mexican Government Administration, announce that freight and passenger service over these lines, from all border crossings, and also from the port of Tampico, are entirely normal. The statement authorized by E. Ocaranza Llano, Director General, and issued by S. W. Fisher, General Agent at Chicago, says:

"We are ready to handle foreign freight through Brownsville, Laredo, Eagle Pass or El Paso, Texas, and the port of Tampico, for all stations on our system, except those south of Oriental and South of Cuautla (Puebla Division), and stations on the Oaxaca Division, South of Puebla.

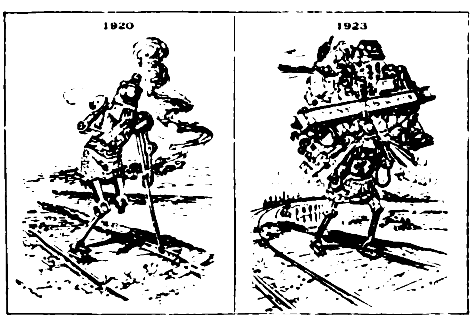
"Trains are moving locally between San Geronimo and Suchiate (Pan-American Division), as well as between Salina Cruz and Puerto Mexico (Tehuantepec Division), but there is no through service between Mexico City and these points on account of interruption of service to Vera Cruz.

"While all traffic has been restored on the Guadalajara Division as far as Penjamo, service to Guadalajara proper is still interrupted, but we are expecting momentarily to be advised that conditions in this section have also been restored to normalcy.

"We have the usual surplus of empty freight cars at the port of Tampico, insuring prompt despatch for all traffic moving via that port. The interchange of foreign cars at Brownsville, Laredo, Eagle Pass and El Paso, Texas, is normal. The necessary motive power to meet all requirements is also available.

"For these reasons United States shippers can feel confident that their shipments to all points in the Republic of Mexico, with the exceptions outlined above, when routed in care of the National Railways of Mexico and Operated Lines (Government Administration), via Brownsville, Laredo, Eagle Pass or El Paso, Texas, or via the port of Tampico, will be handled expeditiously and arrive at ultimate destination safely."

Why Not Continue the Treatment?



In 1920 the Nation's Railroad Servant was Wobbling along on one leg; three years of the Transportation Act Has Brought Him Into Good Health Again

Locomotive Output Doubled

Shipments of new locomotives from manufacturing plants in the United States during the eleven months ended Nov. 30, 1923, were 2,860, of which 2,680 were for American railroads and 180 for foreign roads. This is more than double the number turned out in the same eleven months of 1922, when 862 domestic locomotives and 202 for foreign use were built and shipped by American locomotive shops. Unfilled orders on Nov. 30 showed a reduction from those of Oct. 31. At the end of November, there were unfilled orders for 656 domestic locomotives and 35 for foreign use, a total of 691, while at the end of the preceding month the total of unfilled orders was 977. At the end of November, 1922, the locomotive shops had unfilled orders for 1,619 locomotives the last quarter of 1922 having been marked by more active buying than the last quarter of 1923.

Railway Dining Cars Costly

The Illinois Central System owns thirty-seven dining and cafe cars and nine buffet cars. Five new dining cars are being built. The investment in these cars and in two commissaries, one at Chicago and one at Memphis, is approximately $1,500,000. A modern dining car costs about $50,000. without supplies or equipment. Standard equipment consists of 3,881 articles costing $4,700, including silverware, linen, glass and china, crockery and cooking utensils. A dining car crew consists of from nine to eleven men, and the cost of one crew on the New Orleans-Chicago run amounts to $14,200 a year. Illinois Central dining cars travel nearly 4,000,000 miles and serve about 750,000 meals a year.

C. & N. W. Testing Train Controls

New automatic train controls, that practically eliminate any chance of wrecks or head-on collisions are being tried out on the Chicago & North Western railroad between Elgin and West Chicago. The new device, which automatically stops trains, is operated by electric controls. In case engineers should fall asleep or signals should be misunderstood, the control will stop the train instantly.

An experiment conducted recently proved a novel feature. Two trains were started toward each other but as they came within a few hundred feet both were stopped automatically by the controls.

The Interstate Commerce Commission has issued a rule that railroads will be fined $100 a day, beginning Jan. 1, 1925, if they do not have automatic controls.

High Speeds by Locomotives

Unofficial compilations of train speeds show that the fastest run on the American continent of over 100 miles is made by the Michigan Central's "Detroiter" Westbound, which covers the 109.6 miles between St. Thomas and Windsor, Ont., in 113 minutes, an average of 58.2 miles per hour. The fastest run in the United States for a similar distance is said to be made from Camden, N. J., to Atlantic City, which is the only stretch scheduled at more than 60 miles an hour. The run is made by both the Reading and the Pennsylvania.

Farmer-Manufacturer Meeting Adopts Resolutions; Provides Permanent Body

URGING reduction of taxes by Federal, state county and local governments; asking adoption by Congress of an immigraion policy "limited not by number but by quality and in accordance with our economic needs"; supporting the St. Lawrence River and Lakes-to-Gulf waterways; opposng government ownership or operation of railroads, mines, public utilities, farms or factories, and calling upon the citizens of he United States to renew their loyalty to he Constitution of their country, are maters of vital importance passed on by the Farmer-Manufacturer Convention, called by the Illinois Manufacturers' Association, n a set of resolutions adopted just before the Convention adjourned on Tuesday afternoon, Jan. 15, after a two-day session. The Convention also recommended the creation of a permanent Farmer-Manufacturer Committee for discussion of common problems and common action for their solution.

The full text of the resolutions adopted is as follows:

Preamble

Farmers and manufacturers from many states, assembled in Chicago at the call of the Illinois Manufacturers' Association, after two days of discussion and conference declare our belief that agriculture and industry are interdependent and their common interest best promoted by co-operation. Agriculture, for its own sake and for the good of all the people, needs stabilization. The object of this convention is to consider measures for the promotion of economic and governmental stability. We recommend the creation of a permanent Farmer-Manufacturer Committee for discussion of common problems and common action for their solution. We adopt the following recommendations and authorize the appointment of a committee to present them personally to the President of the United States and to Congress:

I.

We oppose government fixing of prices of agricultural or other commodities.

II.

We approve of co-operative marketing of farm products as offering the most practicable means of stabilizing agriculture on a profitable basis. We urge American universities and colleges, public schools, and especially our State Agricultural Colleges and Agricultural High Schools, to establish regular and special courses in marketing, and that courses in farm cost accounting be stressed.

III.

We commend the Department of Agriculture and the Department of Commerce for the work they are doing in the foreign marketing field and we also urge that it be continued and enlarged in their respective fields.

IV.

In the development of the power at Muscle Shoals, the production of fertilizer should be the primary but not the sole object.

V.

We favor a movement which will encourage the reforestation of thousands of acres of land which should never have been denuded of their timber, and desire to assist in the scientific cutting of our still standing trees.

VI.

We favor a material reduction of the taxes now being imposed by the Federal, state, county and local governments. We commend the efforts which have been made through the Director of the Budget to curtail expenses of the national government. We urge budgetary procedure upon all other governmental units.

VII.

We urge that Congress shall adopt, as a permanent immigration policy, admission of applicants limited not by number but by quality and in accordance with our economic needs. If a system of national quotas be retained by the present Congress, we favor such flexibility of administration that in time of agricultural and industrial expansion enough may come in and time of depression not too many. Selection should be made at the point of origin.

VIII.

We favor an American merchant marine owned and operated by American citizens and directed by agents of American citizens at home and abroad. We favor the patronage by American citizens of American ships. We urge the repeal or modification of our present laws affecting navigation to enable the American merchant marine to operate successfully in competition with the vessels of other nations.

IX.

We favor waterway projects through the Mississippi Valley and other parts of the country as in the interest of farmers and other shippers, particularly the St. Lawrence River and the Lakes-to-the-Gulf proposals.

X.

We congratulate the railroads on their prompt recovery from the disorganization consequent upon Federal control and the vigor and success with which they carried the record tonnage of 1923. National prosperity requires the continued provision of adequate, economical and efficient service. This depends upon the ability of the roads to finance additions and betterments. Enlistment of capital in turn demands stability of government policy sufficient to sustain investors' confidence in the net income of the railways. We favor further trial of the Transportation Act of 1920, without amendment by the present Congress.

XI.

We oppose government ownership or operation of railroads, mines, public utilities, farms or factories. The pledge of less government in business and more business in government met with endorsement by the citizens in 1920. We urge the Federal Administration and Congress to observe this pledge.

XII.

We denounce all legislative projects designed to impair property rights and deprive the industrious and the thrifty of the fruits of their toil and self-denial. We call upon the citizens to renew their loyalty to our constitution, which aims to preserve individual initiative and energy as the basis of a progressive civilization.

XIII.

We oppose every attempt toward depriving the United States Supreme Court of its primary function, to determine the validity of Congressional action threatening the rights of person or property guaranteed by the Constitution. We condemn the proposal to require more than a majority vote of the Court to void any act of Congress, which would give the minority a controlling voice.

XIV.

In behalf of the farmers and manufacturers of the United States we desire to express our appreciation of members of the Illinois Manufacturers' Association and other interests who organized this Convention. We also desire to thank the speakers and all others who, by their efforts and attendance, contributed so largely to its success.

The Chairman of the Committee on Resolutions was John G. Brown, President of the National Live Stock Producers' Association.

King George Honors Heroic Captain of British Vessel

When Capt. Samuel Robinson, R. N. R., the new commander of the Canadian Pacific liner "Empress of Canada," arrives in New York with his ship Jan. 25 to start the Empress' round-the-world voyage he will find awaiting him a letter from Premier Baldwin of Great Britain announcing his appointment as Commander of the British Empire in recognition of his heroism in the Yokohama earthquake, when he saved his ship, the "Empress of Australia," which was at the dock when the cataclysm occurred, and rescued 3,000 refugees. Threatened by repeated shocks, by fire ashore, by blazing oil on the water and by a big steamer drifting out of control, Capt. Robinson escaped repeated perils by quick thinking and masterful maneuvering. As a reward he was placed in command of the "Empress of Canada" for her round-the-world and round-America cruises.

News of Capt. Robinson's recognition by King George was received by Chairman G. M. Bosworth, Canadian Pacific Steamships, in a cablegram from Sir Thomas Fisher of London.

Edward Morris With Produce Firm

Edward Morris, who was President of Morris & Co. prior to its purchase by Armour & Co., has gone into the produce business, being associated with Sherman, White & Co. at Fort Wayne, Ind.

Why not a profit— instead of a loss on your rags?

Forty-nine tons of rags saved in a single year was the record made by one big printing plant with its Troy Rags and Waste Reclaiming System.

How many *Tons* of rags ($) a year are you burning each year?

Our equipment will enable you to *re-use your rags* many times—thereby showing you a *profit* where a loss now exists.

Are you burning your rags, simply because they are grimy, dirty, or oil soaked, when we can show you a far better and more profitable disposition of them by our Reclaiming System?

FOREIGN TRADE

Growing Taste for Precious Stones Shows Imports Amounting to $82,000,000 in 1923—Diamonds Are Most Popular

DIAMONDS imported into the United States in the calendar year 1923 exceeded those of any year except 1919. The total value of diamonds of all lasses imported in the ten months of 1923 or which figures are available is, accord- ng to the *Trade Record*, $52,000,000, and hould the figures for the months of No- ember and December equal those of ctober they would bring the year's total o about $65,000,000 for diamonds alone. f pearls and other materials of this charac- er were included, the total importations f "precious stones" in 1923 would ap- roximate $82,000,000 against $68,000,000 n 1922, and $105,000,000 in the calendar year 1919, the high record year of imports f this character.

That the "precious stone habit" is a growing one with the people of this coun- try is indicated by figures compiled, which show that the total imports of "precious stones" of all classes have grown from $15,000,000 in the fiscal year 1900 to $34,000,000 in 1905, $48,000,000 in 1910, $51,000,000 in the calendar year 1916 and $105,000,000 in 1919.

Exports of cut diamonds from Holland to the United States in 1923 up to Oct. 31, totalled 180,800 carats, representing a value of $16,644,932, as compared with 79,940 carats and $15,338,677 for ten months of 1922. Exports of rough diamonds totalled 40,042 carats and $1,024,106, (5,870 carats, $450,671 in 1922). Exports of other diamonds represented a value of $291,911, making a grand total of $17,960,949. The above figures show a decline for 1923 in the market price of cut diamonds, as compared with the previous year, of about 50 per cent, and of rough diamonds of 200 per cent.

Marine Engine Market in Chile

There are two points in South Central Chile where the market for marine engines permits of some expansion, says the Department of Commerce. Valdivia, situated on the Valdivia River about 11 miles from its mouth, is one, and Talcahuano, located on a fairly well sheltered bay about nine miles from Concepcion, is the other.

Foreign Trade of Netherlands

Taking the Netherlands and the Netherlands colonial territories as a political unit, as against all other countries together with their colonies or dominions, (if any), United States statistics for ten months of 1923 give the Netherlands seventh place as an importer of American goods, exceeded in the order of their import totals by Great Britain, Germany, France, Italy, Cuba and Japan. In the value of United States imports from foreign countries, the Netherlands stand seventh on the list also, exceeded only by Great Britain, Germany, Cuba, Japan, China and France.

Far East Trade Increases

Figures just released by the Far Eastern Division of the Department of Commerce indicate that our total trade with the Far East during the first nine months of this year shows an increase of more than 25 per cent over the same period of last year, in spite of unsettled conditions in China. The Far East now accounts for about 22 per cent of our total trade, compared with only 12 per cent ten years ago. Modern transportation facilities are rapidly bringing the Orient nearer to our door and without doubt we shall witness a trade development during the next decade that will outstrip the record of the last ten years, in which this trade increased threefold, says the Department.

Competition In British Market

The British market for American cars presents the problem of intense competition, states the Department of Commerce. At the present time there are 108 British makes of passenger cars on the market and 77 foreign makes, France leading among the latter with 38 and the United States taking second place with 19. Of commercial vehicles there are 43 British makes and 26 foreign makes. America occupying first place in this classification with 12. It should not be assumed from these figures, however, that the domestic manufacturer has a monopoly in the home market, for it has been estimated that fully one-half of the cars in use in Great Britain are of foreign manufacture, principally American, French, and Italian.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

ALGERIA—8849, chemicals, heavy; 8850, chemicals, heavy.

AUSTRALIA—8843, creosote; 8863, dry goods; hosiery.

AUSTRIA—8807, apparatus and articles for manufacture of beverages; 8800, asbestos, for roofing; 8811, bird's-eye maple; 8845, botanical drugs; carnauba wax; Japan wax; 8811, poplar blisters; 8800, tar products, for building industry; 8845, oils, essential; petrolatum; 8800, slates, roofing; 8811, walnut burls.

BELGIUM—8820, carpets; rugs.

BRAZIL—8844, rosin; wire, barbed.

BRITISH HONDURAS—8852, beans, pink.

CANADA—8812, advertised lines; desk supplies of leather; novelties; toilet articles; silver novelties; 8808, cottonseed cake for cattle.

COSTA RICA—8842, bridge, suspension, 210-foot span.

CUBA—8821, broom corn; bottling machinery; coloring materials; manufacturing machinery; sirups; 8814, lumber, Pacific coast.

CZECHOSLOVAKIA—8857, leather for automobile upholstery.

ENGLAND—8798, brushes, wall paper; wall paper.

FRANCE—8848, black plate; tinplate, brilliant.

GERMANY—8865, airplane motors; airplane instrument boards; brass; 8831, caustic soda; calcinated soda; 8865, chemicals; 8865, coppered steel; copper; drugs; engines and tools for wood and iron working; iron; searchlights; spring wire; steel wire; screws; wire pins; wire ropes; wire cables; optical instruments; 8859, oils and greases, machine.

HONDURAS—8816, band saws, portable.

INDIA—8826, kerosene; 8847, kerosene, water white, odorless.

IRELAND—8839, hardware, builder's; paints; Southern yellow pine; slates, roofing; asphalt felt roofing.

ITALY—8818, graphite, ground for pencils; pencil slats of red cedar.

MEXICO—8846, banana cars; bolts; cement, 500 barrels; locomotives, mogul type, oil burners; nuts; steel rails, standard gauge; steam shovel or drag line; tractor mounting; switches; signals; spikes; timbers, ties, and bridge material, creosoted; 8819, cottonseed, for planting.

NETHERLANDS—8864, hats, buntal.

PORTO RICO—8817, alumina and gravels for purifying water.

SOUTH AFRICA—8815, broom and brush manufacturing machinery; 8834, doors, windows, and Venetian shutters of white pine; 8828, radio sets; radio accessories; 8829, radio sets; radio accessories; 8827, refrigerators, units, domestic, electric.

SPAIN—8830, electric drills for wood and metal; household appliances, all kinds; 8837, road working machinery.

SWEDEN—8851, flour, wheat and rye; 8853, oats, shelled; semolina.

SWITZERLAND—8803, aluminum wire, laminated; drawn aluminum wire; 8805, meat slicing machines and machinery of a similar nature; 8797, tobacco, Kentucky and Virginia.

YUGOSLAVIA—8809, nails, heel, for shoes; russet upper leather; small buckles, for shoes; sole leather, heavy; twine.

SALES MANAGEMENT

Problems Facing Sales Managers in Building Sales Campaigns; Demand, Methods, Personnel, Important Factors

SELLING is very old, but the ideas of selling and methods of selling are constantly being improved, and we go to find information from our friends and those about us. We go to the various organizations that are educating men in selling goods, and what I have to offer you is more or less a digest of all I have been able to accumulate by looking over the hints thrown out by these various organizations, and by taking my friends into confidence and drawing from them such as they have been able to gather in their own businesses.

I do not want to lay stress so much on 1924 as to put before you a few fundamentals on the proposition of sales planning.

Before you can make a sales plan of any kind you must canvass the situation and make an analysis of those factors of your products which control your destinies, as far as your selling force is concerned. The first of these is the question of demand. What is the demand for your product? This is fundamental. Is it large or is it small? Is it established? Is it lying dormant, something that is to be brought to life and made creative, instead of lying in some highway or byway not producing for you? Then you must consider whether that demand is steady or seasonal. This problem of demand is the thing to study before you make your sales plan.

There is another factor just as important for your product, the question of the quality of your merchandise. Is your quality such that you can stand back of your product? Is the quality such, that your salesman can go out and say to the customer, "Here is a proposition of 'money back' if this product is not satisfactory?" Then comes the question of those features which will make a customer buy your product. In paper, for instance, we have to consider the question of the paper we sell to the schools. Here the feature is the price. The quality is there as far as price is concerned, but there is no particular feature other than low price. Another feature may be light weight with the finish. Then here is another paper that simply has a beautiful appearance. So there are the features of a certain product that you must consider before you can start your sales campaign.

The last, in connection with this proposition, is the question of price, and you will have to consider this before you can make your sales campaign; you will have to decide for yourself whether the price is reasonable, whether it is in line with the products of your competitors. Here is our friend. Mr. E. J., who has a line of brushes. In his organization they must determine whether the price is in line with his competitors' price. If they are not, he is not going to sell them, even if the quality is the same.

By CHARLES M. HOLMES
Vice-President and General Manager,
W. M. Welch Mfg. Co.

SALES MANAGERS will find some valuable information in the accompanying article by Mr. Holmes, who, in addition to his duties as Vice-President of the W. M. Welch Mfg. Co., is also President of the Executives' Club of Chicago. This article is an abstract of the first part of an address recently delivered by Mr. Welch before the Chicago Sales Managers' Association. An abstract of the latter part of his address will appear in a succeeding issue of MANUFACTURERS NEWS.—Editor's Note.

We are all in business for profit. We must remember that. We hear many people say, "I am not in business for my health," and yet at the end of the year they come around and look at their trial balance and find they have not made a cent because they have not allowed enough between the cost and selling price to have a dark figure instead of a red one on their ledgers.

The next question is whether your consumer can afford to pay the price you ask. So, I say, it is necessary before you make your sales plan to determine and analyze your product; find out exactly what you have in relation to demand, the quality of your product, the features that appertain to it and the price.

It is absolutely necessary that you set down some definite laws to govern what you are going to do in your sales work; and here again is the question of what shall be your law as to price. Are you going to have one price for Cook County and another for the county in which Springfield is located? Are you going to have a different price for Illinois from Wisconsin and another price for California? It seems to me there is only one policy, and that is the "one price" proposition. In all fairness to your dealers to whom you are selling I think you will find the one price policy is the best, because we must remember that we have a number of trade associations. Retailers of Illinois are getting together with retailers of Iowa and are bringing the fellows down from Wisconsin, and you can be sure of one thing, that when these fellows gather about the table they talk over this price proposition and unless you set down some law to follow in the way of one price, there will be a chance for feeling among your dealers which will crop out sooner or later.

Then there is another law that you will have to observe: What is going to be your method of distributing your product? Are you going to sell direct to the consumer or through the dealer? Are you going to sell through the jobber or make a combination of these? You will have to settle that proposition before you make your sales plan, because when you get into the salesman proposition, that is one of the first questions that will come up.

You will have to say to yourself, "What is my relation with my dealer going to be? Am I going to give an exclusive agency for Lansing, Michigan, or am I going to have three or four dealers in Lansing?" To me it seems there is no more important law for you to decide before you make definitely your sales plan.

After you have solved the problem of establishing some fundamental laws to use in your sales campaign, you can begin immediately on the question of selecting and training salesmen. You have your old sales force. They constantly need prodding with new sales ideas and new methods. But you are going to train your own salesmen and you are going to select them.

In our little organization we count more on the character of its salesmen than anything else, because we sell to schools. We feel we must have men of absolutely clear cut, clean characters, but we do not overlook the importance of the appearance of a salesman and his personality. Personality of a salesman is a characteristic which is to your salesman what perfume is to the flower. It is the thing that puts you in contact or leaves you out when you meet another man, and it wants to be considered very carefully when selecting a salesman.

Then, what are the habits of a salesman? Is he energetic? Can he be on the job six days a week, every week in the month and every month in the year? You should consider his health, and his sales qualifications by investigating his previous record. Oftentime a man will come in and apply for a position and he will say, "These are my references." They look good. The average an, when asked to write a reference for other man, never says anything bad. He ther does not write or he says something od, and if you are going to get underath your reference you must investigate. ere is the question of the definite fitness r your particular job. We say we must ive a man who has school experience, who s used school equipment. Why? Beuse if he has used it he knows how it erates, he can tallk it, he knows the adntages of our school equipment or of od school equipment as opposed to that ade by some competitor who does not ake it as well.

I have thrown out a few generalities in e matter of selecting a salesman, but ere are many more. In the training of lesmen, you must train them in the etails of your product. He will want to now all the details, how it functions and ow it operates; but there is one thing, it ems to me, that is just as important, nd that is the standing or reputation of our company. The first question is, "Am working for a good house?" The second , "Has my house the reputation and presge of being the best in its line?" That the thing you will want to instill into our salesmen when you are training them —whether your house is worth while.

Your salesman wants to be schooled in he market. Do not overlook that, if you lease. Then there is the question of what ctual methods a salesman can use when e goes out to sell your merchandise; what re the points in favor of your merchandise s against those of your competitor? He s going to be met constantly with objecions. He cannot sell because the customer is going to raise objections, and unless you school him in what the customer's objections are to your merchandise, he is not going to have a thorough training.

Here is where the sales manager comes in particularly strong with a salesman: What, as Sales Manager, is your attitude to be towards your salesman? There is only one attitude a Sales Manager can have, and that is the attitude of positive squareness. You cannot do anything else but play square with your salesman and be just at all times or he will find you out, and the minute he finds you out he loses efficiency because if you are his boss he constantly looks to you for suggestion and enthusiasm.

There is one thing in connection with this attitude towards salesmen that I think we overlook at times; that is simply that our attitude ought to be a business attitude rather than a fraternalizing attitude. You want to be on a plane where you constantly talk business with him, reprove him if necessary, and give him your approbation when warranted. I have found in my own experience that getting too close to some of our men sometimes interferes with teaching them what they should do, because I am not in position to correct them when I should, because I am on a fraternal basis rather than a business basis.

The fourth point in this sales planning proposition is, having trained your salesman and of course selected him, you must decide on one basis of compensation. Compensation, of course, is what your salesman is working for. He wants to be paid. He wants to be paid properly, and only as you pay him properly will he succeed. The methods of compensation are three, and they are very old—a straight salary, which oftentimes gives the Sales Manager the greatest control but often works a hardship both on the Sales Manager and the salesman; the straight commission, and the salary-plus commission, which has seemed to me, in my brief experience, to be the most satisfactory.

Building in U. S. Totaled Over $5,000,000,000 in 1923

Total building operations throughout the United States in 1923 were approximately $5,500,000,000, making it the greatest building year in the history of the country. These activities exceeded the previous record breaking year of 1922 by something less than 25 per cent, according to reports from building departments made to the national monthly building survey of S. W. Straus & Co.

The twenty-five leading cities, representing a population of 20 per cent of the whole country, absorbed 50 per cent of the nation's building activities, during the year, thus indicating that in vast sections of the country outside the larger cities the building shortage is not being made up.

Comparable reports from 266 leading cities and towns showed a gain for the year of 23 per cent. In these cities $3,303,041,799 in building permits were issued, compared with $2,687,283,872 in 1922. The greatest gains were recorded in the Pacific Coast states, where activities increased 31 per cent. Gains in other sections were, Central, 30 per cent; East, 18 per cent and South, 14 per cent.

Officers Named for Assn. for Health Examinations

William Butterworth of Deere & Company, Moline, has been elected President of the recently organized Illinois Association for the Promotion of Periodic Health Examinations. A campaign will be inaugurated in Illinois for the purpose of convincing every adult of the importance of physical examinations at least once a year for the benefit of his health. Public meetings will be held in Chicago, Peoria, East St. Louis and other centers. The other officers elected were as follows:

First Vice-President—Dr. Leroy P. Kuhn, Illinois Manufacturers' Association.

Second Vice-President—Barney Cohen, Director of Employment, U. S. Dept. of Labor.

Third Vice-President—Mrs. George Thomas Palmer, President, Illinois Federation of Women's Clubs.

Fourth Vice-President—J. W. Becker, Manager, Illinois State Tuberculosis Association.

Fifth Vice-President—To be selected by the Peoria Life Insurance Co.

Treasurer—John W. O'Leary, Vice-President, Chicago Trust Company.

Secretary—John M. Glenn, Secretary, Illinois Manufacturers' Association.

The directors:

For three years—Dr. Robert H. Hayes, Illinois Tuberculosis Association; George R. Meyercord, The Meyercord Company, Inc.; Dr. Chas. J. Whalen, Illinois State Medical Journal.

For two years—Mrs. Theodore S. Sachs, Naperville Sanitarium; David F. Tilley, American Red Cross.

For one year—Dr. Arthur D. Black, Dean, Northwestern Dental College; Dr. Isaac D. Rawlings, State Department Public Health.

AUTOMOBILE—AVIATION

Prediction That 1924 Will Be Record Year Made by Automotive Executives After Studying New York's Show

THE first of the big national automobile exhibitions of 1924—the show in New York—has come and gone. The first week in February will see the second show of this character, the Chicago exposition at the Coliseum.

With the passing of New York's show automobile men have an opportunity to appraise the motor car situation. Contact with agents and the public in general, from all parts of the country, gives a more thorough understanding of existing conditions than is possible by any tour by any one or half a dozen men.

What is the general sentiment developed from the New York show?

Confidence is the keynote to be heard on all sides—confidence that 1924 will be another banner year in this industry. Feeling among dealers was expressed almost unanimously that the Spring sales of 1924 will equal, if not surpass, those of 1923, and that the first six months of this year will show a shortage of cars rather than an oversupply.

Six trends that are expected to characterize the automotive industry in 1924 are summarized by M. L. Heminway, General Manager of the Motor and Accessory Manufacturers Association, as follows:

According to conservative estimates, 1924 production of cars and trucks will probably be about 3,500,000—the largest year in the history of the industry, with the exception of 1923, and 33 per cent above 1922 total which established a new high record at that time.

Outstanding features at automobile shows are balloon tires, 4-wheel brakes, moderate priced sizes and completely equipped cars, better lubrication methods and simpler and more efficient transmissions and gears.

Business and credit conditions fundamentally sound; financial and sales outlook for strong, well-established companies, providing high quality product, particularly bright.

Continuation of normal trend in direction of integration and mergers, but in orderly and constructive manner.

Development of simplification and standardization in motor vehicle construction, in order to increase efficiency, improve service and enhance convenience and value for automobile user.

Encouraging outlook for sale of American vehicles and motor product in foreign fields, particularly Latin American areas, Australian, and parts of the Orient.

Gas Tax is Popular

Placing a tax upon gasoline to be used for good roads is proving very popular. To date the following states have levied such taxes:

1 Cent Per Gallon—Arizona, Arkansas, Colorado, Connecticut, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, Montana, New Mexico, New Hampshire, North Carolina, North Dakota, Pennsylvania, South Dakota, Washington, Maine, Oklahoma, Texas, Vermont and Wyoming.

2 Cents Per Gallon—Alabama, California, Idaho, Indiana, Massachusetts, Nevada, Tennessee and West Virginia.

Chicago's Annual Automobile Show

COLISEUM

Jan. 26—Feb. 2

2½ Cents Per Gallon—Utah.

3 Cents Per Gallon—Virginia.

Since establishing the 1 cent tax, Arkansas has raised to 3 cents, Colorado to 2 cents, Florida to 3 cents, Maryland to 2 cents, Montana to 2 cents, North Carolina to 3 cents, Oregon to 3 cents, Pennsylvania to 2 cents, South Carolina to 3 cents, South Dakota to 2 cents, Washington to 2 cents, Delaware and New Hampshire to 2 cents.

1 in 7 Persons Has An Auto

There now is one motor driven vehicle to every 7.2 persons in the United States, according to *Automotive Industries*, which has announced that the nation's motor car and truck registration had reached a total of 15,281,295 on December 31, 1923. The gain over 1922 was 2,916,918, or 23.6 per cent, the largest actual increase ever recorded and the largest percentage gain since 1919.

Car and truck owners paid approximately $190,000,000 into State treasuries in motor fees and taxes in 1923. Trucks comprise about 11 per cent of the total.

Auburn Promotes Officials

Roy Faulkner, Sales Manager of the Auburn Automobile Company, Auburn, Ind., has been advanced to Director of Sales. E. H. Gilcrest, formerly Vice-President and Director of Sales of the Westcott Motor Car Company, succeeds Mr. Faulkner as Sales Manager. Roy A. Sears, formerly Advertising Manager of the R & V Motor Co., East Moline, Ill. has been appointed Advertising Manager of the Auburn Company.

Weston Heads Ajax Rubber

J. C. Weston, President of the Ajax Rubber Company, has been elected Chairman of the Board in addition to his position as President. E. L. Fries, Treasurer, has been elected Secretary also. G. E. Shipway, formerly Assistant to the Chairman of the Board, has been elected Vice-President and General Manager

Fisher Body Corp. Buys Timber

The Fisher Body Corporation, with headquarters in Detroit, has recently acquired approximately 100,000 acres of standing timber in Southern territory. The properties will be operated by a subsidiary company now being organized under the corporate name of Fisher-Hurd Lumber, of which O. P. Hurd of Memphis, will be the President and General Manager. These timber properties are located in Tennessee, Arkansas, Louisiana and Mississippi.

Shipments of Automobiles

Shipment figures for October compiled by the National Automobile Chamber of Commerce show a total of 41,700 carloads, 39,200 driveaways and 8,000 shipments by boat. Carload shipments were less in September than in August, but increased during the month of October, to the highest total recorded since May of this year.

R. R. Traffic in Autos

That the railroads will have handled over 540,000 carloads of assembled automobiles and 210,000 carloads of parts and tires in 1923, is the statement of J. S. Marvin, General Traffic Manager, National Automobile Chamber of Commerce. The railroad revenue on this traffic is estimated at $200,000,000.

New Olds Manager at Memphis

Ernest A. Bennett, well known in the motor trade, has been appointed Branch Manager at Memphis for the Olds Motor Company. Mr. Bennett was formerly Indiana distributor for the Dort Company, at Indianapolis.

ane Income Tax Policy, Alexander H. Revell's Plea

(*Continued from page 13*)

orporations and industries, the marketing f new inventions and other activities which vorked for the commercial expansion of ne United States. They now go into a class f investment which offers no such stimuus to either industry or the pay envelope f the employe.

There are many other instances which night be cited to prove that the consumer ays the taxes, but these few should sufce.

And now we reach the question, who is he consumer? Every one, rich or poor.

But the great majority of consumers are ependents, earning moderate incomes, vho work to live and live to work. They ay very small amounts in direct taxes, omparatively speaking, and therein lies he great delusion which agitators seize upn for their personal or political profit. plea for a reduction of direct taxes finds ready audience everywhere, and, coupled vith the lure of a slogan of "swat the ich," becomes wellnigh irresistible in its ppeal to the unthinking.

Waiting for Return to Sanity

Such reasoning is a delusion and a snare, vhich, in the end, harms those the greatest vho believe it. Many citizens who are well ff, so far as wealth is concerned, can and re buying tax-free securities. The unforunate result is that it lets all others, especially the heads of families in the lower income classes, carry a far larger share of the burden than they should. Many who normally would develop new enterprises are living on the accumulations of the past, "waiting at the gate" for a return to sanity.

Granted for the sake of an argument, however, that Senator Johnson's plan for a reduction for "the people who are least able to pay taxes" should be made law. The great volume of indirect taxes, passed on from other sources, would still exist and, indeed, might be aggravated by the new system. It would be far more profitable in dollars and cents to the wage earner to suffer a smaller reduction in his direct payments to the various governing bodies, and to have some of the burden of the more costly indirect taxation removed by a plan such as Secretary of the Treasury Mellon proposes.

No one gets anything for nothing, in the sense in which we are discussing the matter. The consumer pays it all and, in most instances, seemingly prefers to be ignorant of this fact.

"Following the Leaders" after a phantom remedy has become one of the pastimes of the day, even though the followers unwittingly interfere with the prosperity of themselves and their families by so doing. Therein, too, lies one of the big obstacles constantly in the path of orderly, sequential property—encouragement toward investment and in what ought to be reasonably safe industry.

Those who smile when they contemplate "soaking the rich" will smile also at my next assertion. For, strange as it may appear, it is the poor families I am solicitous about. As a rule, especially in the big cities, they are the ones which are "soaked." Poorly lighted and dirty streets and alleys hold their poorly built homes. They pay higher prices than they should for everything they buy, even though their direct tax payments may seem small.

If Senator Johnson really wants to help the wage earners in such districts, he will work for some such plan as Secretary Mellon offers—a plan which offers an opportunity for capital to return to the fields of industrial investment, and for the retail prices of the necessities of life to drop through the elimination of much of the indirect tax expense.

But in all probability he won't. Instead, some agitator will probably read into this modest plea for a sane tax policy, some dark, awful and sinister motive, which he will flaunt before his constituents.

But that is to be expected.

Forestry Congress to Meet

The sixth Southern Forestry Congress will be held in Savannah, Ga., on Jan. 28 to 30 inclusive. Officers of the Congress are: President, Bonnell H. Stone, Blairsville, Ga.; Chairman, Executive Committee, Col. Jos. Hyde Pratt, Chapel Hill, N. C.; Vice-President, P. R. Camp, Franklin, Va.; Secretary, R. D. Forbes, New Orleans; Assistant Secretary, J. R. Weston, Logtown, Miss.

BUSINESS AND FINANCE

November New Capital Flotations Heaviest of the Year Except January—Swift & Co. Does a Big Business

NEW capital flotations in November, 1923, were excessively heavy, reaching the large figure of $539,740,990, the largest amount of any month in the year except January, which was swollen to exceptional proportions by the bringing out of several issues of unusual size.

This is the largest November issue on record, and was due largely to the offering of $100,000,000 by the American Telephone & Telegraph Company and also by awards of state and municipal bonds of extra proportions, totalling $95,450,088. Issues brought out by public utilities reached $191,770,552, industrial issues amounted to $107,177,900, and railroad offerings were $88,092,450—all larger than in the past several months.

These tabulations, compiled by the *Commercial & Financial Chronicle* of New York, include the stock, bond and note issues by corporations and by states and municipalities, foreign and domestic, and also Farm Loan issues.

A summary of the past eleven months of 1923 shows the following:

January	$879,268,265
February	380,187,119
March	392,262,540
April	458,133,469
May	312,635,831
June	536,577,225
July	197,467,011
August	224,867,650
September	249,734,549
October	390,106,577
November	539,740,990

Comparing these figures with the eleven-month period of the four preceding years, thus affording a 5-year comparison, shows 1923 ahead of any other post-war year except 1922, as follows:

1923	$4,560,981,226
1922	4,943,682,244
1921	3,642,279,329
1920	3,720,803,293
1919	4,004,037,705

The largest corporate issue of the month was that of the American Telephone & Telegraph Company, $100,000,000. This issue shares with the $100,000,000 issue of the Anaconda Copper Mining Company last January the distinction of being the largest of the year. Farm loan bonds sold during the month totaled $23,250,000. Only one foreign government loan was brought out during November—the Dutch East Indies of $25,000,000.

Swift Does Big Business

Swift & Co. sales in 1923 were about $100,000,000 more than in 1922, and totaled approximately $750,000,000, according to Louis F. Swift, President of the big packing concern, in his annual statement to the stockholders. The Company is now on a fairly normal basis of operations, judging by pre-war standards, he said, and its financial status is good.

The Market for the Week Ending January 12

	High	Low	Last	Net Change
20 active rails .	83.06	81.78	82.63	+ 1.30

The number of shareholders has increased during the past year and now numbers over 46,000, of whom one-third are employes, owning about $20,000,000 worth of Swift & Co. stock.

The balance sheet showed cash on hand, $7,934,409; accounts receivable, $107,697,907, and inventories, $90,653,967. Liabilities: Accounts payable, $14,742,407; notes payable, $21,240,650, and bonds outstanding, $77,088,500, with a surplus of $63,973,827.

Unclaimed Bank Balances

A bill to amend Section 6219 of the Revised Statutes of the United States to permit state legislation escheating unclaimed funds in National Banks has been introduced in Congress by Senator Pepper of Pennsylvania.

The states already have power to escheat unclaimed funds in the hands of state institutions. Unclaimed funds in the hands of National Banks cannot be reached by the states for escheat purposes unless Congress expresses a willingness that the states should in this respect treat National Banks as they do their own institutions. The provisions of this bill are intended to express the consent of Congress to state legislation escheating unclaimed funds in National Banks to the several states upon the same terms upon which the states may escheat funds in institutions with state charters.

The bill was introduced at the request of Attorney General Woodruff of Pennsylvania and was drafted by Frank M. Eastman, the Special Deputy Attorney General of Pennsylvania in charge of escheats.

New Treasurer for Armour & Co.

F. W. Croll has resigned as Treasurer of Armour & Co. He will remain as Vice-President, however. Succeeding him, Philip L. Reed has been elected Treasurer. Mr. Reed, who is only 41 years old, has had a good financial training for this position. He began his business career in Boston with Winslow & Co., a wool house subsidiary to Armour & Co., twenty years ago and rose to the treasurership. More recently he has been director in a number of other Armour subsidiaries. Until his recent removal to Chicago he was a director of the Old Colony Trust Company and the Brookline Trust Company of Boston.

Postal Savings Deposits

The total postal saving deposits for the fiscal year ended June 30 amounted to $134,458,105, according to the annual report of Postmaster General New, who renews the recommendation that Congress authorize the payment of a higher rate of interest, approximating the standard rates paid by commercial and other banks. He also recommends the removal of the present age restrictions which prevent the acceptance of deposits to the credit of children in their earlier school days, and for authorizing the acceptance of deposits from fraternal and kindred organizations through their accredited representatives. On June 30, 1923, there were 6,802 postal savings depositories an increase of 28 during the year.

Chinese Build New Mint

A mint is now being built in Kalgan, China. It will be known as the K'ou Pei mint, and when completed will produce Chinese copper coins exclusively, and will be capable of turning out 500,000 in a single shift of twelve hours. The minting of silver coins will be undertaken after the mint has demonstrated its success in the minting of copper coins, which are intended for circulation in the Chahar District and in the regions adjacent to the Peking Sui Yuan Railroad, according to the Department of Commerce.

Marketing Farm Products, Subject of F. Edson White

(*Continued from page 8*)

y the carriers. This will stimulate a maximum movement of product at the lowst cost per unit, and contributes the least mount to the margin between producer's nd consumer's price.

Broker's Service Essential

The second problem in a direct and conomical service involves the sale of the roducts to the processor or other agency t the central markets. In the case of most gricultural products, this sale is conducted y an experienced and expert sales agent, who operates on a commission or brokerage basis. His service is essential in order o realize the full value of the product, and s usually more than paid for by the additional money he is able to secure over hat obtainable by the inexperienced producer. As in the case of transportation, he ideal commission or brokerage charge s the lowest one consistent with efficient service. If, through the advent of some agency other than competition, the selling charge is fixed too high, a restraint of trade and production is set up. If, on the other hand, such an agency fixes the charge too low, the most competent men will leave the selling business to seek other fields where their ability will be more liberally rewarded. This will mean that the selling of farm products will be in the hands of the less efficient men, and while the charge for their services may be small, the saving accomplished through the low rates will be more than offset by the failure to secure the highest possible price for the product.

The third problem in a direct and economical service involves the thorough processing of the raw farm products so that they attain a condition suitable for the immediate use of the consuming public. Some few products, such as fruits, eggs, milk and vegetables, require only careful inspection, grading, sanitary treatment and packing or packaging before being offered to the consumer; but most of the agricultural staples require certain definite steps of manufacture. Grain must be ground into flour and the flour in turn baked to bread. Cotton must be converted into thread and fabrics be woven from it. Livestock must be slaughtered, skinned, dressed, cooled, and cut in convenient pieces for distribution and sale. The hides and pelts must be cured, tanned and manufactured into the various products, and the numerous other by-products must be manufactured with expensive machinery by expert men. Furthermore, only a limited part of the animal is meat and of the meat only a small percentage comprises the most popular cuts.

It is quite commonly stated (as a reproach to the packer, I suppose) that the producer only receives 8 to 12 cents a pound for his live animal, while a steak in the retail market costs four to five times as much. The chief reason for this much advertised discrepancy is that the animal is not made up of steaks. After processing comes the problem of distribution. The products which have been prepared for sale often have to be shipped hundreds, or even thousands, of miles to the point of consumption. This involves the railroad transportation already referred to and, for many perishable products, highly specialized equipment. The large processing companies, like the one I represent, own expensive refrigerator cars constructed especially for meat transportation. Moreover, the carcass of each beef we kill averages in travel 550 miles to point of sale to the retailer, the carcass of the average lamb travels over 600 miles, and the products of the average hog travel 450 miles.

Retailing Is Expensive

The last step on the road from the producer to the consumer is the retail store. Retail distribution is usually performed by individuals who operate private stores at such places as will make buying convenient for the ultimate consumer, the housewife and her charges. Furthermore, the retailer is usually required to deliver his merchandise at the door of the buyer, thus providing the greatest convenience possible for the purchaser. Retailing, therefore, involves heavy costs, for even the carriage of the goods to the home cannot be performed without a remuneration, while the matter of weekly or monthly

bills, instead of a cash transaction, places an overhead charge on the public as a whole that is not normally appreciated. When the housewife complains about high prices on her purchases, or the farmer about the small share he receives of the dollar the consumer pays, neither realizes that they are paying for freedom from the time and work required to transport and transform the kernel of wheat into the slice of bread or the living animal into the slice of meat. When the farmer objects to receiving only a dollar for a bushel of wheat, when it brings $9 in the form of bread, he overlooks entirely the fact that he is not performing the service the consumer demands and is willing to pay for, and that some other people are performing this service with expensive equipment and expert artisans.

In closing I should like to discuss briefly the important question as to whether the road from the farm to the city home can be shortened and made cheaper without sacrificing efficiency and convenience. This topic has been treated as a political football for such a long period that anyone who has constructive ideas on the subject is desirous of avoiding quotation. It is, therefore, with a certain degree of fear of the consequences that I grasp this "poker" by its red-hot end. Frankly, I believe that the present agencies which have developed under the stress of actual competition in production, marketing and distribution, and which adjust themselves to the changes that arise as each day or year goes by, come as near to meeting the actual needs of the situation and perform their services as efficiently and effectively as anything that can be devised. The present system has grown up after centuries of trial and error, and the keen competition required for the making of a living has eliminated practically all the wasteful procedures that might develop. All of the so-called "short cuts" have proved to have either only a local application or a survival based on a less complete service. The further one goes into such an economic study on a national or international basis, the more fully he comes to appreciate the real effectiveness of the present marketing system.

I do not wish to suggest that no improvements can be made in the present methods of marketing, for such improvements are in progress all the time and are the natural result of evolution in as dynamic a subject as trade. The recent co-operative movement may prove such a forward step, but I do believe that improvement in marketing will never come by the revolutionary process. One cannot uproot the mighty oak and replace it with an elm or maple of equal size. If a new species of tree is to appear in the forest, is must come by gradual growth. Furthermore, if the conditions are such that the oak can no longer withstand the rigors of its environment, it is replaced by the growth of other species while it gradually decays. In the same way, the oak of tried market methods cannot be cut down at once, with the expectation of the immediate replacement by the elm of experimental marketing. The forest is not replaced with the blare of trumpets, neither are economic methods.

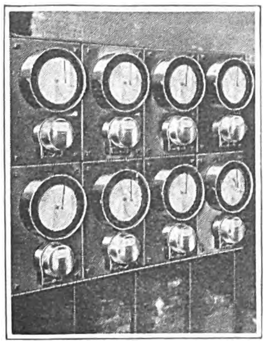
Despite all the political "mud-slinging," the test of permanence in business is the ability to withstand competition, and it is my belief that competition in business is more pronounced today than at any other time in world history. Furthermore, as our political economic structure becomes more complex, as our population becomes increasingly urban, and as our civilization assumes the new characteristics certain to develop in the next half century, this competition will become more and more stringent. Under these conditions, farm products will be subject to wider demand from all parts of the world, and it may be expected that their price levels will be correspondingly more perfectly determined.

Know Department Steam-Cost

Your Production Cost System tells you exactly how much labor-cost, material-cost, and overhead-cost enter into the total cost of each finished article of manufacture.

But do you know how much steam-cost, as an item, enters into the cost of each article—into each process? How much steam each department, each machine, is using? Have you a positive, graphic record of how much steam is being produced per pound of coal used?

Republic Flow Meters tell you these things. Tell them in permanent record form. Let us show you how they pay for themselves. It will pay you to ask for "Power Plant Cost Accounting." Free, of course.



Also makers of CO2 Recorders, Model S. F. C., and Draft Recorders and Indicators

Charles H. Hulburd, Head of Elgin Watch Co., Is Dead

Charles H. Hulburd, President of the Elgin National Watch Company, died suddenly at his home, 1138 Lake Shore Drive, Chicago, on Monday, Jan. 14. He was 73 years old, having been born in Stockholm, N. Y., May 28, 1850. He came to Chicago in 1873.

Mr. Hulburd had been the active head of the Elgin National Watch Company since 1898. Educated as a lawyer, he practiced in Chicago for two years, when he gave up his law work and entered the grain commission business with his uncle in the firm of Culver & Co., with which he continued until it closed up its business in 1888, the members of the firm retiring. Mr. Hulburd traveled extensively in Europe during the next five years and in 1893 he re-entered the grain business, forming the firm of Hulburd, Warren & Co., of which he was Treasurer. Upon the retirement of T. M. Avery as President of the Elgin Watch Company, Mr. Hulburd was elected his successor. During the twenty-eight years he headed this Company it developed into one of the greatest watch manufacturing concerns in the world.

Besides being President of the Watch Company, Mr. Hulburd was a capitalist of large holdings, having been director for many years of the Illinois Trust & Savings Bank, the Corn Exchange National Bank, now affiliated with the Illinois Merchants' Bank group, the South Side Elevated Railroad, and other corporations. One son, De Forrest Hulburd, is Vice-President of the Elgin National Watch Company.

Illinois Agricultural Assn. Meet

Discussions on everything from the details of business affairs of the organization up to taxation, co-operative marketing, transportation, and commodity development, took place at the annual meeting of the Illinois Agricultural Association in Galesburg, Jan. 16 and 17. The principal speakers on the two-day program were: O. B. Goble, C. A. Stewart, George Wicker, George E. Frazer, James C. Stone of Kentucky, Dr. J. H. Tilden, Prof. Richard T. Ely of Wisconsin, Hon. Cleveland A. Newton of Missouri and Benjamin H. Darrow of Ohio.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

THE United States Department of Agriculture has begun a comprehensive sury of the electrical requirements of farm omes throughout the country with the obct of furthering the efforts of other ornizations to make electric service availle to the farmer.

At a conference recently held in Washgton, the Secretaries of Agriculture, Comerce, and the Interior, promised their ssistance to the national committee on the lation of electricity to agriculture, which made up of representatives of the Ameran Farm Bureau Federation, the Amerin Society of Agricultural Engineers, the ower Farming Association and similar roups.

Secretary of the Department of Agriculre Wallace has already begun a national rvey along the following lines:

1. The economic relation of power and achinery to farm incomes and prosperity.
2. A comparison of agriculture with ther industries, including value of investent and product, number of workers, orsepower used, etc.
3. Sources of farm power; horses, mules nd oxen, gas and steam engines, electricity, ind and man-power.
4. The use and distribution of power nd labor on the various types of Amercan farms, and the size of farms.
5. The co-operating organizations have ach undertaken a survey of some phase of arm electrification, and their combined eforts are expected to produce the most omprehensive data ever compiled.

Chicago's Street Car Business

Recently published figures of the United States Census Bureau for the State of Illiois on the electric railway industry show ome interesting data when compared with similar figures furnished by the Chicago Surface Lines, both being for the year 1922, according to J. V. Sullivan, statisician for the Chicago Lines. The Chicago area is about one-third of 1 per cent of hat of the State and its population is 42 per cent.

Although the Chicago Company is only one of the seventy reporting in Illinois to he Census Bureau, it owned in that year 31 per cent of the miles of track and 39 per cent of the number of cars. Its employes numbered 50 per cent of the total and its wages and salaries amounted to 58 per cent. It carried 43 per cent of the revenue passengers, operated 50 per cent of the car mileage and paid 54 per cent of the taxes.

Super-Power Company Formed

Plans for a super-power corporation to link up a number of public utilities in Kansas, Missouri, Iowa, and Nebraska have been announced by the Continental Gas & Electric Company following purchase of a controlling interest in the Kansas City Power Securities Company, which controls the Kansas City Power & Light Company.

The Continental bought a majority of the stock from Joseph F. Porter, President of the Kansas City company, and associates. The Illinois Power & Light Company two months ago purchased the minority holding of J. Ogden Armour in the Kansas City company.

To Build $16,000,000 Plant

The Des Moines Electric Company, a subsidiary of the Illinois Power & Light, is to have a new $16,000,000 plant with an ultimate capacity of 200,000 horse power. Work will be begun at once on the first section, which is to cost $6,000,000. The plant will be a steam-generating installation on a site of sixty-three acres at the junction of the Racoon and Des Moines rivers Southeast of the city. The project is the largest initiated by the Illinois Power & Light since its organization last June upon the merger of a number of utilities companies.

Fox River Traction Line Sold

The Western United Corporation of Aurora, of which Col. Ira C. Copley is the President, has purchased the Aurora & Fox River Electric Company, which operates an electric traction line in the Fox River Valley. This road was in financial difficulties and there was danger it might be sold for junk, as several other electric lines in that territory have been.

Uniform Utility Laws Are Needed Throughout the U. S.

Little or nothing has been done towards unifying state laws regulating public utilities, despite efforts at the unification of laws covering other fields, says Lewis E. Gettle, Chairman of the Wisconsin Railroad Commission. Mr. Gettle's statement was drawn up as a supplement to a digest of the railroad and utility laws, the first of the kind ever compiled, written by a committee under his leadership.

"Our Committee's survey shows that there are forty-nine commissions working under a wide dissimilarity of laws," the statement points out. "In several of the states the commission, in fixing rates, is still limited to the establishment of maximum rather than absolute rates. In some of the states the commission has been granted extensive power and authority over the question of competition and the prevention of duplication of equipment through the use of the certificate of public convenience and necessity. In other states no such power has been conferred upon the commission."

Are You "Behind the Times"?

Not many years ago your grandfather reaped his crops—picked his cotton — dug canals and loaded his ships by hand. He also shoveled coal on his fire and hauled out ashes.

Today — you have advanced. You have machinery to do the work your grandfather did by hand. But—do you still shovel coal and haul out ashes? In Chicago today—Manufacturers are keeping abreast of the tide of industrial advancement and *improving* their products, simply because they know that—

If it's done with heat—

Mississippi Valley Assn. Names 20 Traffic Experts

President James E. Smith of the Mississippi Valley Association has appointed a committee of twenty traffic experts representing the territory served by joint rail and water service made available by the operation of the Federal Barge Line on the lower Mississippi River which will seek to bring about a better understanding on the part of the shippers in the Illinois, Ohio, Mississippi and Missouri River territories of the facilities now available for reducing transportation costs.

The committee represents nineteen prominent Mississippi Valley shipping points including St. Louis, Mo., Memphis, Tenn., Peoria, Ill., New Orleans, La., Meridian, Miss., Rockford, Ill., Houston, Tex., Chicago, Ill., Evansville, Ind., Toledo. O:. Corpus Christi, Tex., Pittsburgh, Pa., St. Paul, Minn., Dallas, Tex., Cincinnati, O.; Kansas City, Mo., Natchez, Miss., Cairo, Ill., and Sioux City, Iowa.

The functions of the committee will be to keep in close touch with the operation of the Federal Barge Line from a traffic point of view; to attempt to adjust, whenever possible, service and rate controversies arising between the Barge line management and the shipping public and to spread the knowledge of the Federal Barge Line rates and operations in the territory where joint rail and water rates are in effect. Where specific communities are inclined to the belief that existing rate structures are unfavorable to them the committee will investigate such complaints and make proper recommendations to the Barge line management, it is stated.

Nat'l Malleable Castings Company Gets New Name

National Malleable and Steel Castings Company, Cleveland, recently incorporated under the laws of the State of Ohio, is the name of the new corporation succeeding the National Malleable Castings Company, under its plan of reorganization.

For many years the National Malleable Castings Company has produced steel castings as well as malleable iron, but until now the name has not indicated the full scope of its business. In addition to manufacturing castings to order, the Company produces a number of specialties, such as automatic car couplers, journal boxes, draft riggings, Naco cast steel anchor chain and malleable iron stove castings.

Malleable iron castings for all purposes will continue to be produced at Cleveland, Chicago, Indianapolis, Toledo and East St. Louis; open hearth steel castings at Sharon, Pa., and Melrose Park, Ill., near Chicago, and electric steel castings will be produced at Cleveland, Chicago and Sharon.

Foreign Trade Meeting in June

The eleventh National Foreign Trade Convention of the National Foreign Trade Council will be held in Boston on June 4, 5 and 6, according to an announcement by O. K. Davis, Secretary of the Council.

Incorporated Under the Laws of the State of Illinois

Illinois Manufacturers Mutual Casualty Association

(INCORPORATED)

A Service Department of the Illinois Manufacturers Association

The Illinois Manufacturers Mutual Casualty Association, Inc., has been organized by Manufacturers of the State of Illinois to furnish to the employers of the State efficient service in the solving of plant accident problems.

The Association through co-operation can effect a large saving on Compensation Insurance premiums each year and in addition furnish superior service to its policy-holders.

Full information and rates will be furnished prior to the expiration date of your present policy.

Chicago, Illinois
Telephone Central 1240

Manufacturers News is published every Saturday by Glenn & Company, 76 W. Monroe St., Chicago, Illinois. Subscription price $4.00 a year; 15 cents a copy. Entered as second class matter March 4, 1912, at the Post Office at Chicago, Ill., under act of March 3, 1879.

THE CREAM OF SOUTHERN ILLINOIS

HARCO
COAL

Every user of Harco has a good word to say for it

Harrisburg Colliery Co.

1212 Old Colony Bldg. Chicago, Illinois
Wabash 7551

The Ideal Plant
In The Ideal Location
At 25% Present Cost

Splendid heavily built steel and concrete fireproof three-story daylight FACTORY BUILDING, totaling approximately 56,000 square feet of floor space, directly connected to two-story brick mill constructed warehouse containing approximately 32,000 square feet of additional space. Both buildings on double track B. & O. Ry. siding, and fully complete with heating plant, elevators, power lines, etc.

Also, we offer a four-story brick heavy mill construction warehouse or factory building, totaling approximately 30,000 square feet of well-lighted floor space on B. & O. siding.

These plant properties are located in the city of Troy, Ohio, county seat of Miami County, 18 miles from Dayton, 26 miles from Springfield. Have excellent steam and electric railway connections and an ideal labor situation.

UNIONISM IS UNKNOWN IN TROY, OHIO

JOHN J. GLENN, *Secretary and Treasurer*
JAMES C. GILRUTH, *Associate Editor*
NORMAN M. FRENCH, *Sales Manager*

Ed. Hurley Again Working for the Public

EDWARD N. HURLEY, manufacturer and public servant, again has been chosen to work for his country and for other countries. This time he will go to Europe to serve as one of the Debt Funding Commission. First, as the most construcive member of the Federal Trade Commission, at its organization, then as head of the United States Shipping Board during the war, he has given freely of his time and labor in public service. He is our idea of the highest type of American citizen. He does things. Others talk of doing something. He is a builder. Others would try to destroy. He is the antithesis of the demagogue.

One Way to European Peace

DECISION by France to cut down her standing army to 350,000 or 200,000 less than the pre-war standard, is the most encouraging news that has come from Europe for many weary months. There has been an idea that France—possessing the largest army in the world, save Red Russia—was unduly and threateningly militaristic. It made England nervous. It made Germany suspicious. It was criticized by friends of France in the United States.

A huge standing army is highly provocative of war. It made Germany go to war. It is like an automatic pistol in the hip pocket. There is a temptation to use it.

Furthermore, a great standing army has no parallel as a tax eater and a burden upon the public. France lately has had to raise taxes. She cannot pay debts. She has suffered from the financial oppression of her standing army when she urgently needs funds for other things.

France now will be in a position to win back pre-war prosperity.

Tax Reduction Plans

THERE are a number of "copy cats" of the Mellon Tax Reduction Plan. Imitation is the sincerest flattery. But Secretary Mellon's plan is the most logical, the soundest, fairest and most constructive of them all.

Why Illinois Coal Mines Are Closed

ILLINOIS and Indiana coal mine operators are trembling in their boots over the rapid inroads being made by Eastern operators into markets formerly claimed by the Midwestern soft coal producers because of the lower production costs enjoyed by non-union mine owners.

Eighty mines in Southern Illinois are closed, including many in "Bloody Williamson County," which is praised by union labor publications as the strongest union labor county (100 per cent) in Illinois.

Consumers cannot be blamed for viewing the situation with complacency. Nor can they be criticized for buying coal where they can get it the cheapest. It is costly enough, even when bought from the more efficient non-union mines.

Competition is an excellent thing in trade. It is injecting new life into the coal business. If Illinois and Indiana could get rid of some of the iron-clad state laws which practically turn coal mining over to the United Mine Owners of America, they might get back some of the business they have lost.

Meanwhile, consumers have been advised there will be another soft coal strike in Illinois next April. Why? Perhaps Illinois' Miners will strike because 25,000 of them have been forced to lay off since January 1, 1923, by the high cost of mining they have created by their own wage contracts. If they had the right kind of business manager, they would be working now.

What the Illinois mines and miners need for their own good is a liberal dose of open shop medicine.

Relieving Freight Terminal Congestion

ALFRED H. SWAYNE of New York, Chairman of a special committee named by officials of the Chamber of Commerce of the United States, says that more than a billion dollars can be saved to the railroads and merchants of the country in the next five years through the transfer of freight terminals from congested city areas to "green lands" and the use of organized motor trucking service.

In other words, he would remove the freight terminals from greatly congested centers, away from the hurly-burly and turmoil of the metropolis, and give motor trucks a chance to move speedily.

Mr. Swayne says that store door delivery by motor trucks would afford the shipper an expedited completed delivery of the commodities which he sells or buys that would greatly solve the terminal problem. He would save a good deal of money and great relief would be afforded to the public. Mr. Swayne might have added that accidents would be materially reduced. This is a good suggestion for Chicago, St. Louis, New York and other crowded industrial centers.

Our Vulnerable Panama Canal

IT has been definitely established by military maneuvers at Panama that our Canal can be successfully attacked (possibly blown to smithereens) by an enemy, followed by the landing of troops in small boats without great difficulty. Perhaps this is true. But with war maneuvers—like statistics—you can prove anything.

Freight Rate Cut No Aid to Farmer

Proposed Reduction Would Injure Railroads Without Return to Agriculture; Service of Utmost Importance

THE following article is an abstract of the address delivered by Mr. Markham on "The Railway Situation as it Affects the Movement of Farm Products," delivered before the National Farmer-Manufacturer Convention, recently held at the Congress Hotel, Chicago, under the auspices of the Illinois Manufacturers' Association.—Editor's Note.

PROSPERITY is simply a state of economic health. The functions of business and industry, like the functions of the human body, are affected by health and sickness. A strong, healthy condition of the producing, distributing and marketing activities of the nation makes what we call prosperity. Every form of business and all classes of our citizenship desire to promote and maintain prosperous conditions. But it must be understood that the various parts of the business and industrial structure of the country are interrelated and interdependent. No part of it can successfully function alone. Real, enduring prosperity, therefore, cannot be had unless the whole structure shares in it and unless all of the involved and complex factors in our economic life are enjoying sound, stable business health. Farmers cannot be prosperous unless they are able to place their products promptly on the market and obtain good prices. If the railroads do not provide dependable, adequate, efficient service the farmers are prevented from selling their products profitably. Railroads in their turn cannot prosper unless there is a demand for transportation at rates commensurate with the cost of furnishing it. All forms of industry suffer unless there is steady employment at good wages.

It seems to me that there is a more general realization among all classes of our people that business is correlated and that what affects one branch of the commercial structure affects the whole. This convention illustrates the trend of the times. You have met here to discuss the common problems of agriculture and manufacturing. You understand and accept the identity of your interests, and each one of you is concerned about the success and prosperity of your neighbor, since his well-being directly affects your own well-being.

Transportation by the railroads is a service vital to agriculture. Farm products have a substantial value only as they can be transported from the 6,500,000 farms scattered over this vast continent to mills, packing houses, factories and distributing centers and transported again to cities, towns and countrysides where reside the millions of individuals for whose consumption they are produced.

By CHARLES H. MARKHAM
President, Illinois Central Railroad Company

Charles H. Markham

Without the service of transportation, farm products would be practically valueless. To the farmer, therefore, the major function of transportation is that it shall be adequate to accomplish this needed distribution.

Cheapness of transportation is of secondary importance. This is illustrated by the demand for special service in the movement of highly perishable farm products. Such products usually move in refrigerator cars, under ice, and on expedited schedule. That service is necessarily more expensive than ordinary freight transportation, but producers of fresh fruits and vegetables do not hesitate to purchase the higher quality of service which gives their products greater value in the markets to which they are consigned. For, actually, the shipper is not the one who pays the freight bill. It may come out of his pocket temporarily, but it is returned to him in the enhanced prices his goods bring on the markets to which the railroads carry them. If this were not true, there would be no object in transporting his goods.

One of the fundamental differences between the railroads and most other industries, including agriculture, is that an increase in the demand for transportation does not increase the price of transportation. An increase in the demand for farm products or products of other industries does increase their prices. If rates were subject to the law of supply and demand, as prices of goods and other services are, the railroads would be able to exact higher rates at times of peak traffic and transportation shortage and the higher rates would be paid without much protest. In 1920 and 1922 there were shortages of transportation in the Fall, at the time farm products were moving to their markets. In 1921 and 1923 the railroads were able to furnish promptly all of the transportation required by the farmers at marketing time. In the seasons of transportation shortages, I have no doubt, farmers generally would have been willing to pay much higher freight rates if, by so doing, they could have had the prompt, efficient service they needed.

Favors Rate Regulation

I do not mean by this that I favor unregulated freight rates. I believe in rate regulation. This principle of our present law under which rates are regulated is just, and conducive to the welfare of both the railroads and their patrons. The principle is that rates shall be based primarily upon the cost of producing transportation service. Moreover, I believe that rates should be stable, so that farmers and other business men may know in advance what their transportation cost will be and plan accordingly. The likelihood of constant variations in rates would have a tendency to unsettle business.

It is contended that the railroads should come to the relief of certain industries in times of depression by granting reductions in freight rates on the products of those industries. This idea has received considerable attention in the last three years in connection with the agricultural situation and the agitation for reduction of rates on farm products. It is based upon the wholly unsound theory that freight rates are a material factor in determining the prices received by farmers for their products.

A few examples showing how widely prices of farm products fluctuated during a short period in the Fall of 1923, when there was no change in freight rates to markets on those products, will prove that there is no foundation in fact for this theory.

On August 17 farmers at Lincoln, Ill., were receiving 88 cents a bushel for No. 2 wheat. The freight rate to the Chicago market was 7.5 cents a bushel. On October 19 farmers at this same point were receiving 96 cents a bushel for the same grade of wheat. The freight rate to the Chicago market was still 7.5 cents a bushel. With no change in the freight rate to market, there was a variation of 8 cents a bushel in the prices received by the farmers—a greater variation than the freight amounted to in full.

On August 31, September 7, and September 14, No. 3 yellow corn brought farmers at Minonk, Ill., 80 cents a bushel. On October 12 and October 19 the same grade of corn at the same point brought 98 cents a bushel. On October 12 and October 19 No. 4 corn cold for 80 cents a bushel at Minonk, and the same grade of corn at the same point had dropped to 62 cents a bushel on November 30. In each of these three grades there was a variation in price of 18 cents a bushel, but throughout the period referred to the freight rate on corn, from Minonk to the Chicago market, remained constant at 6.4 cents a bushel.

Farmers at Hinckley, Ill., sold new oats on August 17 for 32 cents a bushel. On October 5, October 12 and November 30, the price received by farmers at the same point for the same kind of oats was 40 cents a bushel. Here was a fluctuation of 8 cents a bushel. There was no change, however, in the freight rate on oats from Hinckley to the Chicago market in this period, the rate remaining 2.9 cents a bushel.

These instances furnish absolute proof that freight rates are a minor factor in determining the prosperity of the farmers. If the opposite were true, it would be logical to assume that under the same conditions rates would affect two sets of farmers in the same manner, and we know they do not. During the last year there was no general change, either upward or downward, in freight rates on wheat or corn. Yet it is freely admitted that corn raisers enjoyed a fair measure of prosperity, while wheat growers as a whole were not prosperous.

Freight Rate Cut No Aid

In a recent investigation of the Interstate Commerce Commission into rates on grain, grain products and hay in Western states, witnesses testified that a reduction of 10 per cent in rates on wheat would mean not more than 1 to 1½ cents a bushel, or an average of only about 30 cents an acre in the wheat-growing territory of the Northwest. This small sum, even if the farmer should receive it—and there is no assurance that it would not be absorbed in reduced selling prices to the consumers—would not bring prosperity to the farmer. But in the aggregate it would be a serious matter with the Western railroads, which are earning only about 4½ per cent on their tentative valuation at present rate levels. The railroads are in favor of reducing rates just as soon as the costs of providing service are reduced. Western railroads are now spending 88 cents of every dollar they earn for operating expenses and taxes. Of every $100 paid out for operating expenses $61 is paid for wages. The Western railroads are paying their employes $550,000,000 more wages a year than they paid in 1916.

All of the evidence we have tends to support the inescapable verdict that further reduction in freight rates, even if they could be made without permanent injury to the railroads and to the transportation service which agriculture needs, would mean little to the farmers in comparison with other factors which affect their prices. I will return later to the question of how reductions in freight rates at this time would affect the railroads and their service.

What are the factors more important than freight rates in the farm situation?

In a general way, they are farm operating costs, including the cost of rental of farm lands, interest charges, taxes, the cost of labor and supplies, the expense marketing system through which farm products pass on their way from producer to consumer; the prosperity of business in other lines which is reflected in the full employment of labor at wages which permit of liberal buying among all classes; and the international situation as it affects our world commerce. All of these are problems which command our most thoughtful attention.

I want to call your attention in particular to one of these problems which is also a real problem for the railroads. That is taxation.

We view with proper alarm any increase in the taxes which we pay directly, but I believe we are inclined to pass over lightly the question of increases in our indirect taxation. Every farmer is painfully aware of the fact that real estate and personal property taxes have increased enormously in the last few years and that he is paying income taxes which he did not pay before the war. But the farmer's taxes do not stop there. He pays taxes whenever he makes a purchase, large or small, regardless of whether he buys an automobile or a sack of flour, pays a freight bill or settles his account with his dentist. Taxes are a part of the cost of conducting every form of business, and they inevitably form a part of the prices established for the goods or services produced by every form of business. Regardless of who pays them in the first instance, in the end they come out of the pockets of the farmers, business men, laborers and all other classes of our population.

Out of every dollar taken in by the railroad in 1923 they spent a fraction over 5 cents to meet their direct taxes. Therefore, the farmer who buys a railway ticket pays a nickel of his dollar to meet railway taxes as truly as he would if the railroad paid no taxes and the burden was carried by direct taxation, the farmer paying his share. Moreover, taxes enter into the cost of all of the materials and supplies consumed by the railroads in their operations. A part of the cost of their coal represents taxes paid by the miners who dig it out of the ground and by the operators who conduct the mines. Taxes paid by the builders of cars and locomotives are passed on to the railroads, and the railroads have to raise the money out of freight and passenger rates.

Tax Boosts Passed to Consumer

Every business man who has any control over his prices adds his taxes to his operating costs, then adds a few cents more in most instances to make it even money and passes the increase on to his patrons. Increases in taxes upon houses and apartment buildings are paid in the end by increases in rents. Increases in taxes paid by the producers and distributors of food and clothing are passed on to the buyers of food and clothing. As these burdens increase the cost of living, they create a demand for increased wages, and increased wages in turn are reflected in higher prices paid by everyone.

Most of those who advocate rate reductions at the present time take the position that the concession should come out of the net earnings of the railroads, after payment of operating expenses and taxes. A reduction in taxes generally would amount to a good deal more for the farmers of the country than reducing the net earnings of the railroads and giving the farmers their share in lower rates. In view of these facts, why do those who claim to represent the farmers before the public make the railroads special objects of their attacks? I submit that the man who wants to be of real service to American farmers can employ his time to better advantage by working for economy in the administration of government than by attacking the railroads and their none-too-substantial earnings.

A committee of the Chamber of Commerce of the United States has recently made a thoughtful survey of the transportation situation in which it found that railway freight traffic probably will increase 33⅓ per cent and that railway passenger traffic probably will increase 25 per cent between 1923 and 1933.

The committee estimated that during the next ten years, in order to handle this increase in traffic promptly and efficiently, the railroads need to build 38,350 miles of new track, buy 13,200 new locomotives, 725,000 new freight cars and 12,300 new passenger cars, and make corresponding increases in their other facilities. It was estimated that a total sum of $7,873,000,000 needs to be spent in the next ten years on additions and improvements in railway properties, or an average of more than $787,000,000 a year. For a good many years prior to 1923 the expenditures of the railroads for improvements and additions have averaged not more than $550,000,000 a year.

What does this mean? It means that unless the railroads can raise an average of around $787,000,000 a year, most of it from the investors of the country (which is about a 50 per cent increase over the rate of new investment for many years past, excepting 1923), the railroads ten years from now will be unable to supply promptly the service which agriculture and the other business of the country must have. Railway credit must be maintained—not merely in fairness to the owner of railway stocks and bonds, whom we are leaving out of the question just now—but in fairness to the farmer, the manufacturer, the business man. It must be maintained on such a scale that new capital for financing will flow into railway investments in much larger volume than in recent years.

(*Continued on page 19*)

Waterways Vital to the Mid-West

Completion of Mississippi Valley Program Will Be Boon to Industry—Lowering of Lake Level Denied

ONGRESSMAN NEWTON is an authority on waterways, and his address be-re the Annual Meeting of the Illinois anufacturers' Association, recently held the Congress Hotel, Chicago, was a asterful exposition of the needs of the eat Middle West together with a complete futation of the objections brought against is development. The following article an abstract of his address.—Editor's ote.

By CLEVELAND A. NEWTON

Representative in Congress from 10th District, St. Louis, Mo.

Hon. Cleveland A. Newton

A PROBLEM which vitally concerns Chicago, but which concerns the Mississippi Valley and the whole nation vastly more, is the problem of seting beyond question the right to divert om Lake Michigan into the Chicago rainage Canal, and thence down the Illiois and Mississippi Rivers to the Gulf, 0,000 cubic feet of water per second. This roblem concerns Chicago because it afords sanitary relief and insures health to e population of one of the wealthiest nd most rapidly growing cities in America. t concerns the people of the Mississippi alley because it insures a channel for avigation 200 feet wide and 9 feet deep rom the Great Lakes, increasing in width s it reaches the Illinois, Mississippi, Misouri and Ohio Rivers on its way to the ulf, and guarantees to the commerce and ndustries of the great Valley facilities for heap water transportation.

The average rail rate throughout the United States last year was 10.78 mills per ton mile, and I do not believe that the railroads can afford to materially reduce their rates. The War Department operates a barge line upon the Mississippi between St. Louis and New Orleans. This operation is experimental in character, is carried on over a channel much of which is unimproved, is lacking in equipment and terminal facilities and is suffering from many other handicaps, and yet at all seasons when the operation was not delayed by unimproved stretches in the River, the barge line earned a handsome profit to the War Department carrying freight at 3½ mills per ton mile, while the Great Lakes steamers are thriving carrying freight at 1.14 mills per ton mile. There is not the remotest doubt but what if a channel adequate for navigation is opened from the Great Lakes to the Gulf and the pending projects upon the Mississippi, Ohio and Missouri Rivers completed, the commerce of the Mississippi Valley will be afforded adequate and cheap facilities for transportation. Farm products and other heavy freight can be carried at rates not to exceed one-fifth of the rates which the railroads can afford to make. Such an improvement would develop and increase the tax-paying wealth of the Mississippi Valley to the benefit of the whole nation.

We have in the Mississippi Valley, waterway projects adopted nearly fourteen years ago by Congress, upon reports and recommendations of the engineers of the War Department, to be completed in twelve years, consisting of the Ohio River from Pittsburgh to Cairo, the Missouri River from Kansas City to the mouth, the Mississippi River from Minneapolis to the Gulf, and certain tributaries penetrating the rich productive areas of the Valley. The period for their completion has long passed, and at the present rate of appropriations they will not be completed for years to come. These adopted projects comprise a waterway system 6,520 miles in length, flowing within reach of every section of the greatest productive areas in the world. Think what it would mean to open a channel from Chicago through the Valley which would bring the commerce of all the cities upon the Great Lakes in direct contact for trade and exchange with the markets of the vast area of the Mississippi Valley.

The taxpayers of the Great Lakes and the Upper Mississippi Valley contributed their share toward the construction of the Panama Canal. However, up to this time the Panama Canal has been of little substantial benefit to the commerce of this section. Think what it would mean to this vast agricultural and manufacturing area if cheap water lines could be opened up direct to the Gulf, thus bringing within our reach, at reasonable rates for transportation, the ports of the Pacific Coast, Mexico, Central and South America on both the Atlantic and Pacific sides, and the markets of China and the Orient. And all of this can be done and all of the adopted projects of the Mississippi Valley can be completed for an expenditure of $75,000,000, which is less than one-tenth of the amount expended last year by the railroads in the United States for improvements alone.

We hear much in Washington from members of Congress representing the region of the Great Lakes about a sea-going canal from the Great Lakes down the St. Lawrence. If such a project is feasible and practicable, then I am for it, notwithstanding the fact that I am advised that the leaders of this project have expressed themselves as being opposed to the Chicago diversion and notwithstanding the further fact that members of Congress from Great Lakes districts have generally voted against adequate appropriations for inland river improvement, because cheaper facilities for transportation constitute the crying need of the nation, and water transportation is always infinitely cheaper than rail.

Barriers to St. Lawrence Canal

But there are barriers delaying this undertaking. First of all, we have no treaty with Canada authorizing such a project, and we have no proof as to when or whether such a treaty will ever be executed. An improvement so vast and expensive as the proposed St. Lawrence Canal, while intended as a powerful commercial instrument in time of peace, should be available for the national defence in the event of war. What proof have we that we can procure with Canada a treaty which will guarantee to us the use of such a canal through neutral alien territory in the event of a future war? Furthermore, the St. Lawrence route enters the ocean among the floating icebergs of the North, and could not be available for navigation more than six months in the year, while a waterway system through the valley can be navigated from Cairo South the whole year through, and the tributaries to this Southern section can be navigated from nine to ten months in the year.

Why delay the completion of a great waterway through our own country while we negotiate with Canada for the right to construct a waterway through an alien country? We have expended already $174,000,000 upon these Valley waterways. Until we finish them we will continue to lose the interest upon this vast investment and the public will be deprived of the benefits of cheap water transportation and $75,000,000 will finish the job. Why not do it now?

The potentiality of our inland rivers as bearers of commerce is generally known. How many manufacturers in Illinois are aware of the fact that any one of the towboats of the Mississippi Barge Line can carry from St. Louis to New Orleans in six days, enough freight to load 600 freight cars, or twelve full trains with fifty loaded cars to each train and 50,000 pounds to each car? With this great Valley Waterway System developed, connecting the Great Lakes with the Gulf, 500 of these tow-boats could carry 30,000 car loads of freight from Chicago to the Gulf in twelve days' time. Think of such a power to relieve the freight congestion of a rapidly growing commerce, and think of the saving to the shipper in carrying so great a quantity of freight at rates which water facilities alone can afford, and think of the rapidity, in the event of war, with which our supplies could be moved out to the sea.

Our right, however, to divert 10,000 feet of water per second from Lake Michigan through the Chicago River into the Illinois and Mississippi Rivers, for purposes of sanitation and navigation, has been challenged. This challenge seems to have been inspired by certain hydro-electric power interests of Canada and New York who seek to convert to their own use the waters of the Great Lakes in the manufacture of power.

It should not be forgotten that two-thirds of the water front of the Lakes and all of Lake Michigan is in American territory. Our right to divert water from Lake Michigan for the purposes specified was recognized by the International Waterways Commission, consisting of three Americans and three Canadians appointed by their respective governments, in a joint report made to their respective governments on January 4, 1907. Paragraph 13 of that report reads as follows:

> "A careful consideration of all the circumstances leads us to the conclusion that the diversion of 10,000 cubic feet per second through the Chicago River will, with proper treatment of the sewage from areas now sparsely occupied, provide for all the population which will ever be tributary to that river, and that the amount named will, therefore, suffice for the sanitary purposes of the city for all time. Incidentally it will provide for the largest navigable waterway from Lake Michigan to the Mississippi River, which has been considered by Congress.
>
> "We, therefore, recommend that the Government of the United States prohibit the diversion of more than 10,000 cubic feet per second for the Chicago Drainage Canal."

At the time this report was made, and for seven years prior thereto, 4,500 cubic feet of water per second was being diverted from Lake Michigan into the Chicago River and this official International Commission recognized the right and the feasibility of increasing the amount of this diversion to 10,000 cubic feet per second.

Treaty With Great Britain

Pursuant to the report and recommendations of this Commission, the United States and Great Britain entered into a treaty, which was ratified by Great Britain on March 31, 1910, and by the United States on April 1, 1910, which contained the following provision:

> "The High Contracting Parties shall have, each on its own side of the boundary, equal and similar rights in the use of the waters hereinbefore defined as boundary waters.
>
> "The following order of precedence shall be observed among the various uses enumerated thereinafter for these waters, and no use shall be permitted which tends materially to conflict with or restrain any other use which is given precedence over it in this order of precedence:
>
> "First—Uses for domestic and sanitary purposes.
>
> "Second—Uses for navigation, including the service of canals for the purposes of navigation.
>
> "Third—Uses for power and for irrigation purposes.
>
> "The foregoing provisions shall not apply to or disturb any existing uses of boundary waters on either side of the boundary."

This treaty reserves to the United States the right to divert waters on its own side of the boundary for uses of navigation and sanitation, and gives each of the High Contracting Parties the right to priority in the use of water for navigation and sanitation for power and irrigation. And, as conclusive evidence that both Great Britain and the United States had the diversion through the Chicago River in mind, the treaty contains the following provision:

"The foregoing provisions shall not apply to or disturb any existing uses of boundary waters on either side of the boundary."

It should not be forgotten that at the time the treaty was executed, water from Lake Michigan had been flowing through the Chicago River down the Illinois and into the Mississippi for a period of ten years.

It comes with poor grace for Canadian and New York interests to protest against the diversion by the United States of 10,000 cubic feet of water per second from Lake Michigan to relieve so urgent a need for sanitation and navigation and which will serve as a benefit not only to Chicago and the Mississippi Valley but to our whole country, when they themselves are diverting from Lake Erie, for purposes of power and navigation, a sum total of 62,200 cubic feet per second, which necessarily causes a serious lowering of the Lake Erie level, with a corresponding increased drain upon Lake Huron and Lake Michigan. This diversion is allocated as follows:

To the Canadian-owned Welland Canal, 1,500 cubic feet of water per second, and with the completion of a new Welland Canal, now in process of construction, the Canadians propose to largely increase this diversion not only for canal but for power purposes. There is also allocated out of the waters of Lake Erie, for the use of a Canadian power company, 36,000 cubic feet per second, while there is allocated and used by the power interests of New York out of the waters of Lake Erie for the manufacture of privately owned hydro-electric power, 20,000 cubic feet per second. And it is reliably reported that the power companies of New York and Canada are now preparing appeals to their respective governments to permit them to increase the diversion for hydro-electric power from 56,000 to 80,000 cubic feet per second. It is contended by the power interests of Canada and New York that the water which they divert is restored in Lake Ontario; but what use is this to Lakes Michigan and Huron for this water is gone from them forever? How long will our Government permit this discrimination and injustice against the Middle West?

Milwaukee's Protest Groundless

There is a wail from Milwaukee charging that the diversion of 10,000 cubic feet of water per second from Lake Michigan through the Chicago River into the Mississippi during the past twenty years has lowered the level of the Lake to the extent of 6 inches; but what are the facts? The Straits of Mackinaw, between Lake Michigan and Lake Huron, are so wide and deep that these lakes maintain the same level. The surface of Lake Erie is eight feet lower than that of Lake Huron. In 1904, according to the report of the U. S. Army Engineers, the channel emptying Lake Huron into Lake Erie had an average depth of from 12 to 15 feet. In the interest of navigation one channel was constructed between Lake Huron and Lake Erie 600 feet wide and 22 feet deep, while another channel was constructed from Lake Huron to Lake Erie 450 feet wide and 22 feet deep. Thus there was carried, after these improvements, an additional volume of water from Lake Huron to Lake Erie 1,050 feet wide and 8 feet deep, and this additional drain upon Lake Michigan and Lake Huron has continued for more than twelve years, while the diversion from Lake Michigan into the Chicago River has been less than 200 feet wide and 9 feet deep. In other words, the excess water drained out of these lakes into Lake Erie for the purpose of navigation during the past twelve years has been more than five times as great as the amount taken out of these lakes through the Chicago River.

The protest which to the public mind seems most effective against diversion is the contention that it will lower the lake levels and thus interfere with navigation. The surprising fact remains, however, that a limited diversion from Lake Michigan through the Chicago River and the enormously increased flow from Lake Huron to Lake Erie, caused by the deepening of the channel between these lakes for navigation, during the past fourteen years, has lowered these lakes according to the most extravagant contention only six inches, while there are numerous experts who contend that there has been no appreciable lowering of the lakes during that period. But if, in fact, the lake levels have been lowered, then regulating works can be constructed between Lake Huron, Lake Erie and Lake Ontario which will retard the flow of water accumulated in the high water season so that the levels can be maintained, and even raised, without injury to navi-

Carl Fisher—Builder of Miami Beach

From "News Butcher" to Millionaire Is the Romantic Story of His Career—Creator of World-Famous Resort

A MAN who can rise by sheer force of intelligence and superlative energy from the humble position of train boy to the creator of a world-famous tropical city is an example of American enterprise to inspire admiration.

But Carl G. Fisher—like Thomas A. Edison, who also started life as a train butcher—has something besides the well-directed intellect and indomitable will that command success. He has imagination, the ability to look ahead. This gift enables him to sense what the public wants. Furthermore, he has the courage to take the risk that involves large projects. He has the soul of an empire builder. He is a romantic figure.

Carl Fisher does not wait for Opportunity to knock. He goes out and finds Miss Opportunity, woos her with the fair word and convincing logic of an American business man, and takes her home in his motor car to the dream city 'mid its sheltering palms.

By CHARLES WARNER

Written for Manufacturers News

Carl G. Fisher

AS news butchers go, Carl Fisher was a good one. He passed up and down the aisles of trains on Indiana railroads, sold newspapers, picked up papers left by passengers in their seats and resold them to other passengers, handed out crackerjack and peanuts and magazines galore, and his smile could get a dime for an apple.

This was years ago. Passing up and down the train aisles he caught visions of great achievements that he would some day accomplish. Vague and misty these visions were then. But later they took definite shape. As a news butcher Carl Fisher sold books. He could convince a rural passenger on his first trip to Indianapolis that "Her Guilty Crime" was the long looked for great American novel, and the passenger would grudgingly take out a dollar and pay for it. With the same persistence and assurance he built the world's greatest pleasure resort on a sandpit on the water front of Miami, Fla., and made Miami and the world like it.

The story of Carl Fisher's achievements is an inspiration to every manufacturer and business man. Once convinced that a proposition was a go nothing could stop Fisher. If a thing was right he would plunge to the limit. He quit the trains and got interested in automobiles in Indianapolis. Also balloons. He was an entrant in the international balloon race in 1909 which started from Indianapolis and landed in the night on a woodpile at Ashland, Ky.

Then he got the idea that Indianapolis should have the largest speedway in the world. Some of his friends thought Carl had lost his mind. But Carl built the Indianapolis Speedway—a mammoth structure which does all its business, pays its expenses and makes its profits on one day out of the year.

Early in 1913 Fisher, who had accumulated a fortune, got into a canoe and paddled down the Mississippi. He paddled as far as he could and then motorboated around to Miami. He was in search of health. Now it may be—nobody can tell—that the spirit of Ponce de Leon, who dreamed there was a fountain of perpetual youth in Florida, got into Fisher. At any rate it is certain the Spanish explorer never had a dream more lurid than the one Fisher had when he landed at Miami.

Miami then was a little known place. Trains deigned to stop there on the way to Palm Beach. The town is on Biscayne Bay, a strip of water seven miles long and between two and three miles wide. Between the bay and the ocean was a long narrow tongue of land a little more than a mile wide. The man who owned it is said to have paid $12,000 for it. It was a worthless jungle, a tangle of saw grass. In 1884 some New Jersey men tried to start a cocoanut grove on it, but their efforts failed. The result was, however, that the entire ocean front became fringed with beautiful cocoanut trees.

John S. Collins, a New Jersey fruit grower, one of the men interested in the cocoanut venture, held on while his associates dropped out. Collins conceived the idea of planting an avocado grove on some high land in the middle of the sandspit and it proved a success. He started the construction of a wooden bridge in July, 1912, two and a half miles long to connect the sand spit with the mainland, but ran out of funds.

Then along came Carl Fisher in 1913. He supplied Collins with the money necessary to complete the bridge and took in return a deed to a large part of the jungle on the ocean front. Fisher then went out to look his possessions over and to dream a bit. There was a solid wall of mangroves around the shores on both the ocean and bay sides. Their interlaced roots existed in a tangled mass several feet above the water. There were cabbage palms and palmettos through which no human being could make his way. The cabbage palms and palmettos filled all his property except the shores where the mangroves held sway. The interior contained panthers, bears and many thousands of smaller animals.

But Fisher was undaunted by these obstacles. All he saw was this site for America's greatest winter resort. His friends, who feared for his sanity when he proposed the Indianapolis Speedway, were now firmly convinced that Fisher needed a conservator. At the extreme end of the tongue of land he started his laborers clearing off the jungle. Then he built concrete bulkheads as fast as the land was cleared. On the inside of these bulkheads sand and water were pumped. The water ran off but the sand remained and turned the swamps into solid land.

Soon came dredging crews of 150 men, three pumping boats, two digging boats, fifteen barges, five supply boats, two oil tugs, two anchor boats and an 18-inch pipe line over a mile long. For eight months Fisher's pay roll was $4,000 a day. In 1917 the jungle disappeared and in its place was a desert of sand. Then came the finishing touch.

Canals and inland waterways were dug to afford easy access to all parts of the property by yacht and motor boat. Palms and various varieties of flowering shrubs and trees were planted. Fifty acres were turned into polo fields, 325 acres were given to a golf links. Great hotels, casinos, bathing beaches, wonderful boulevards and streets—where a brief ten years ago was a jungle—the city of Miami Beach. Its value has grown from $12,000 to $20,000,000. There are over forty miles of streets and roads. Several hotels have been built and more are projected.

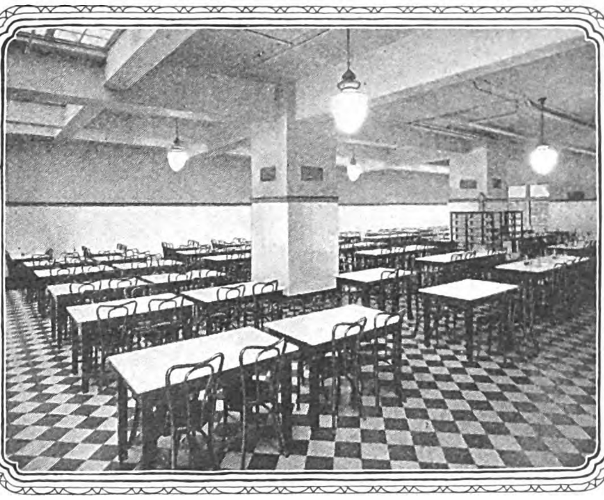
Mr. Fisher is also the reputed originator of both the Dixie and Lincoln Highways, two nationally famous trans-continental automobile routes.

Chicago Trust Company Celebrates 21st Birthday

The Chicago Trust Company is now "of age"; it has recently passed its twenty-first birthday. And, in celebration of that event and as a special feature in the recent opening of its new banking quarters at Monroe and Clark Streets, Chicago, it has issued a handsome brochure entitled "The Making of a Trust Company." This booklet is beautifully bound, printed and illustrated, and contains an introduction by George Ade.

In describing the growth of the Chicago Trust Company the book recites the story of corporate expansion that followed the lean years after the panic of 1893. Organized in 1902 by Joseph E. Otis, Ralph C. Otis and Walter H. Wilson as the Chicago Savings Bank, it has grown from a small savings bank to one of Chicago's strong banking institutions. On May 1, 1902, its capital stock was $250,000 and its total deposits were $27,830. Its report to the State Auditor of Sept. 10, 1923, showed capital stock of $1,500,000, surplus of $500,000 and deposits of $19,087,286.

Only three presidents have headed this bank—George H. Webster, a former partner of Philip D. Armour, who was in office for five years; Ralph C. Otis, President in 1907 and 1908, and Lucius Teter, its present chief executive. The name was changed from the Chicago Savings Bank to the Chicago Trust Company in 1917.



Vitrolite is the favorite material for wainscoting, table tops and counters in industrial lunchrooms

Vitrolite Displayed!

Beautiful Vitrolite — the slab material hard as flint, smooth as satin, stain-proof, scratch-proof, of abiding cleanliness. Glistening white, black and color-decorated. Displayed in use as wainscoting, toilet partitions, table and counter tops — at the general offices of

First Aid Treatment for Fractures

Never Move Victim Until Nature of Injury Is Known; Directions for Bandaging Breaks Explained by Expert

THIS is the third of a series of articles by Capt. Fisher on Industrial First Aid written for MANUFACTURERS NEWS.—Editor's Note.

By CAPT. G. R. C. FISHER

Inspection and Safety Department,
Illinois Manufacturers Mutual
Casualty Association, Inc.

AMONG industrial accidents, the breaking of bones is by no means an uncommon occurrence. Therefore, a little knowledge along this line will be the means of not only giving some comfort to the injured, but especially of saving him from further injury and giving him proper care until the surgeon arrives. The essence of real First Aid is to see that the victim of any accident suffers no further injury while awaiting medical aid. That, truly, is everything, since only too many injuries are aggravated either through ignorance or the clumsy handling of his helpers.

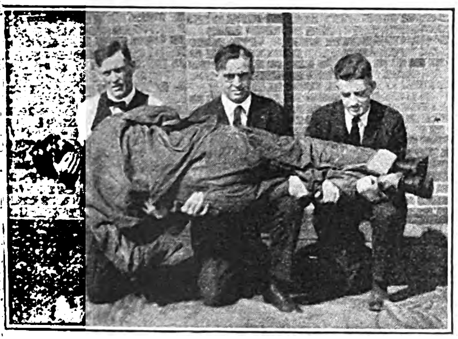

Figure 1

A fractured or broken bone is usually not hard to find, as there are certain signs which always show up. The most common of these are pain at the point of injury, loss of power in the use of the limb or movement of parts affected, swelling and deformity.

The two kinds of fractures are the simple, where it is a clean break through or across the bone, and compound, which is very serious, because in addition to the breaking of the bone the ends are seen sticking through the skin. Not infrequently arteries on large veins may be torn, and when that is the case the loss of blood is very great.

The compound fracture calls for very careful handling. First—the limb must not be moved, no matter how much deformed or bent it may be; support it just where it is. Second—if there is much bleeding, and especially if the blood is bright red and is coming out in spurts, which is evidence an artery is severed, no time can be lost in applying a tourniquet and rushing medical aid.

It will be wise in treating cases of suspected fracture to always suspect the worst; but don't give away your fears to the victim. Then you will be playing safe and there will be less chance of complicating things.

Remember the general rule—never move the injured until some idea of the nature of the hurt is discovered and, if he is unconscious, don't revive him until the injury is located, First Aid given, and any necessary movement of victim is made.

Watch out for nervous shock, being careful to treat it, as this condition is often the cause of death following such an accident.

For all injuries to the head, carefully lay victim on back, with head slightly raised from the shoulders up; if on cot, table or bench, place something under the legs to raise them about 6 or 8 inches. If there is no scalp wound place a cold wet cloth over the entire skull, cover the body with a blanket and hold a cloth sprinkled with aromatic spirits of ammonia to the nostrils for a moment while in-breathing.

For suspected injuries to the back, don't move until a stout board is had, cover with a blanket; then, with two or three persons kneeling, very gently roll the victim on his side, push the board close in, and then roll back onto same.

Lacking a proper board, if the victim must be moved, proceed as follows: Have three men kneel on the knee nearest to the victim's head; together gently roll him on his side, face inwards; lift to standing knee; then take a fresh hold and together rise to standing position, and pace to point selected to lay him; lowering in the same manner he was raised. (See Fig. 1.)

For a broken jaw the signs are drooping jaw, teeth uneven on sore side, and often bleeding gums. Gently bring teeth of jaws together, use a long narrow scarf, such as a folded triangle bandage or long necktie; catch under chin with scarf end, carry long end over top of head, cross ends above ear on injured side pulling tight, carry short end across forehead, and the long end around nape of neck; tie ends above opposite ear. (See Fig. 2.)

Broken Collar Bone

Broken collar bone: Signs—droop of injured shoulder, pain and loss of power in arm; if fingers are run over both bones a lump is usually felt on broken side. Place a pad under armpit on injured side (a cloth cap folded together will do); gently press arm into side, bringing forearm at right angles across waist line and secure in place by a broad triangular bandage, or towel around waist and over lower arm and forearm. (Study left figure in Fig. 3.)

Broken shoulder blade: Signs—pain at blade and loss of power in corresponding arm. Have helper hold arm out; place a broad scarf, with center over blade; cross ends on opposite shoulder and tie under armpit. Place hand on opposite shoulder and secure with St. John's arm sling. Description of this sling will be given in detail in future chapter on bandaging. (Study figures at left and right in Fig. 4.)

Broken ribs: Signs—great distress in breathing, hands usually clasped over injured side. Use a broad scarf with triangular bandage, or folded towel; place over ribs immediately above hip bone, pull tight enough to give reasonable relief for breathing a bit easy; then secure ends and put arm on affected side in sling. (Study center figure in Fig. 4.)

Broken forearm (also finger, hand or wrist): Signs—pain, loss of power, swelling and deformity. Use a flat piece of board, heavy cardboard, etc., reaching from finger-tips to elbow securing above and below with narrow scarfs; place arm in narrow sling. Folded newspapers make a most excellent splint. Always fold to length of limb and wide enough to lay the arm in, which is known as a "box splint." (Study central figure in Fig. 3.)

Broken upper arm: Signs—same as above. Make splints from cardboard, lath, pieces of shingle, etc. (pad by rolling in paper); have outside splint reach from below elbow to shoulder and inside splint short enough so as not to hurt when the forearm is bent; support with narrow sling. If the break is near shoulder or elbow do nothing until surgeon comes, and, especially, do not bend forearm. (Study right figure, Fig. 3.)

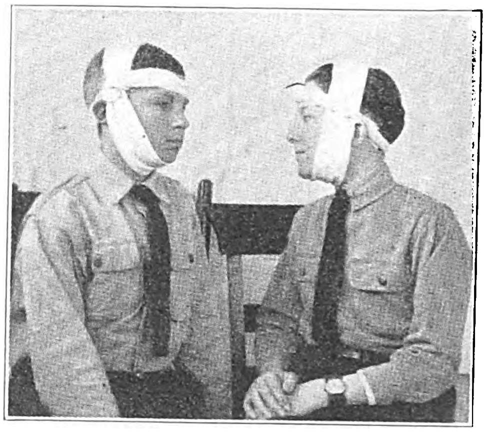

Figure 2

Treatment for Broken Thigh

Broken thigh: Signs—same as in arms. In this emergency the greatest care must be taken in handling the victim; if he must be moved before splint is applied, lift him as in Fig. 1, but be sure broken limb is on top of sound limb; the splint necessary must be a 3 or 4-inch wide board, long enough to reach from arm pit to heel; place on outside of injured limb, securing with broad scarfs at armpit, waist, top of thigh, above knee, below knee and at ankle; tie all knots on the splint and then tie both limbs together by an extra broad scarf at about middle of leg. If a board is not to be had, a broom may be used; cover broom part with cloth or paper and place under armpit so the pole will be against limb; if nothing can be found to use as a splint, at least tie the broken limb to the good one before victim is moved. (Study recumbent figure in Fig. 3.)

Broken knee cap: Signs—pain right at cap and victim is not able to use leg. Place board splint as illustrated on recumbent figure in Fig. 4.

Broken leg: Signs—as in the other fractured limbs. If it is the outside or "brooch bone," don't splint; keep quiet until surgeon arrives. If the "shin bone" is broken, either place a 3 or 4-inch wide board on inside of limb to reach from middle of thigh to heel; secure with scarfs, above knee and above and below break; tie both legs together. Two umbrellas, one on either side of limb, make good improvised splints.

Broken ankle or foot, or sprained ankle: Remove shoe by slitting back seam or laces, pull apart and slip off. If medical aid is not soon obtained or victim has to be transported, make an "L" splint by toenailing two thin boards, to fit foot; pad, and secure at and above ankle and instep; also place cold wet compress over ankle if there is no wound. In all ankle injuries where there is much swelling, some comfort is felt if the limb is elevated, as this decreases blood pressure and helps to allay the throbbing.

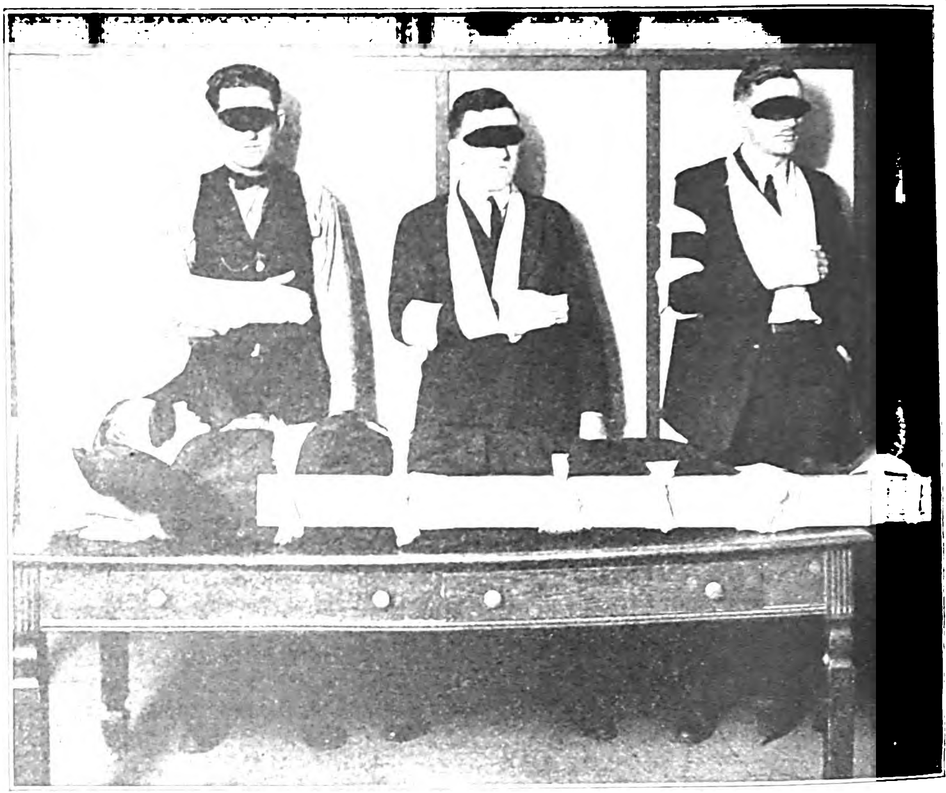

Figure 3
Left Figure—broken collar-bone; Center figure—Broken forearm; Right figure—broken upper-arm; Recumbent figure—broken thigh

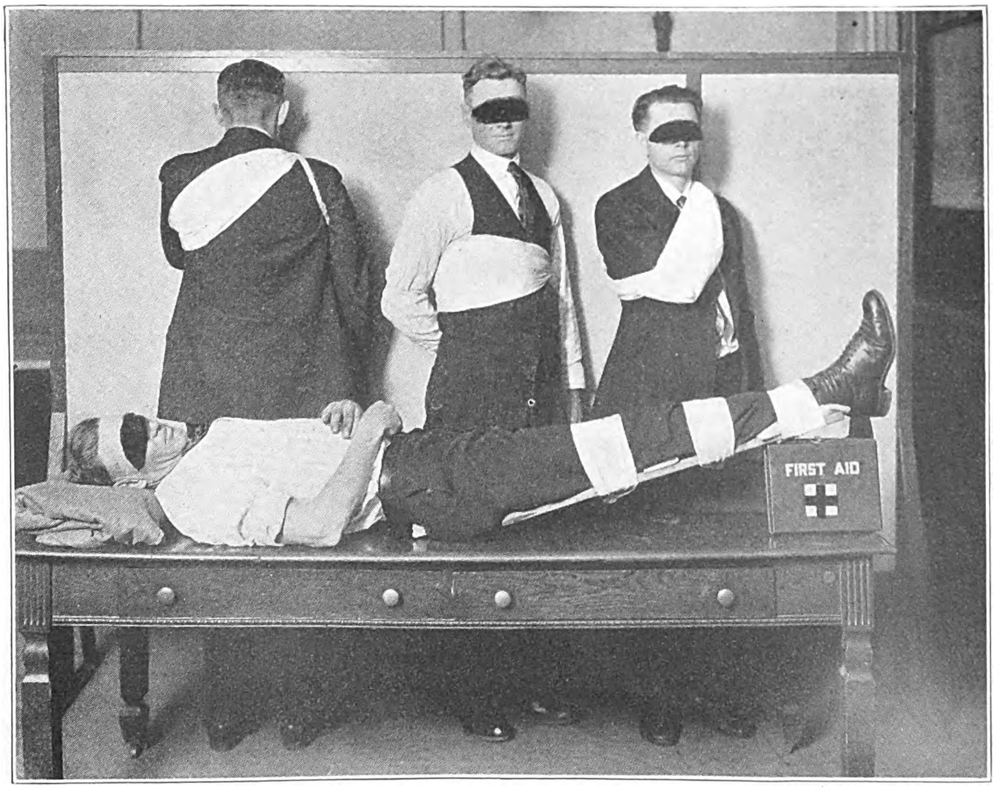

Figure 4
Left figure—broken shoulder blade; Center figure—broken ribs; Right figure—broken blade arm sling to give support to arm, with hand on shoulder (this sling is known as "St. John's Arm Sling"); Recumbent figure—broken knee-cap

Tax Congress Will Meet on Feb. 8—Speakers, Subjects

The fourth annual Tax Congress, under the auspices of the Illinois Manufacturers' Costs Association, will be held at the Hotel LaSalle on Friday, Feb. 8. Two sessions will be held, the morning meeting beginning at 11 o'clock and the afternoon session meeting immediately following the noonday luncheon, which will be at 12:30 o'clock.

E. M. Hickok, President of the Illinois Manufacturers' Costs Association, will preside over the morning session, and the speakers and their subjects at this meeting will be:

Walter Leclear, C. P. A., Ernest Reckitt & Co., Chicago, and President of the Illinois Society of Certified Public Accountants, on "Inventories."

George E. Frazer, C. P. A., Frazer & Torbet, Chicago, on "What Happens to a Tax Return After it Reaches Washington."

E. C. Heidrich, Jr., President of the Illinois Manufacturers' Association, will preside at the meeting following the luncheon, and the speakers and their subjects will be:

J. R. K. Bristol, Manager, Tariff Department, Canadian Manufacturers' Association, Toronto, on "The Sales Tax of Canada."

Arthur Andersen, C. P. A., Arthur Andersen & Co., Chicago, on "Present Federal Tax Situation."

John W. Thomas, Vice-President, Central Trust Company of Illinois, Chicago, on "How a Bank's Loan Officer Measures the Financial Status of a Borrower With Reference to his Taxes."

How to Build Industrial Production

Labor Question Is a Tremendous Factor in Factory Problem—Divergence of Views on Overhead Expense

By W. A. LAYMAN

President, Wagner Electric Corporation, St. Louis

'N last week's issue of MANUFACTURERS NEWS Mr. Layman discussed e work of the Engineering and Design ivision and of the Scheduling or Plan- ng Department. In this, the final installent of his address recently delivered beore the Southern Division of the Illinois anufacturers' Costs Association at St. ouis, he takes up the Manufacturing Deartment and with it that great industrial roblem—Labor.—Editor's Note.

II

IN this department (Direct Manufacture) we deal with one of the largest items of manufacturing cost; namely, productive and expense labor, and, therefore, come face to face with that tremendous industrial question—the labor problem. Since the labor item of cost is o large a percentage of total cost, the ndustrial manager evades his greatest esponsibility if he does not give his direct ersonal attention to an understanding of he labor situation in his business.

Some of the guiding principles which re, in my opinion, conducive to peaceful nd efficient shop operations where large umbers of men are employed, are as folows:

(a) There must be no question of the continuous exercise in liberal spirit of the square deal toward every employe.

(b) The most liberal wages consistent with the prosperity of the business and with the wage standards of the geographic district should be paid.

(c) The management must know what is going on in the shop, detect evils quickly at their source, and administer correction of such evils promptly.

(d) The development of Czarism on the part of superintendents and foremen must be adequately guarded against.

(e) No agitation of fraternalism, race, color, creed or unionism should be permitted in the shop.

(f) The individual employe should be protected against "Boss-ism" either within or without the shop, and he should be free to develop his God-given talents as the business may healthfully permit.

(g) There should be little or none of the old-fashioned raising hell by shop executives; quiet, yet forceful methods gain the best results in the long run.

(h) The fair conditions of employment should be made known to each employe at the time of employment, and a brief, but clear, general set of instructions is a good thing to hand the new employe as he enters the shop.

(i) People of good character only should be employed, and high standards of morality should be encouraged on the part of employes and maintained in the business itself.

(j) While the employer cannot reasonably attempt to regulate the private life of the employe, yet he may reasonably require that the private life of every staff member shall be such as to not impair his capacity for good and efficient service during business hours, and shall not be such as to reflect upon the reputation of the company, or his own reputation in the community.

(k) The employer should carefully safeguard the health of every employe by not only providing healthful surroundings, but also avoiding the employment of men whose physical condition or general health will be a menace to those around them.

These are a few of the fundamental and elementary conditions, as I have said, to peaceful and efficient shop operation, from the standpoint of relation of management to employe. Other considerations equally important will, no doubt, occur to others.

In the matter of industrial methods which secure efficiency, all industrial executives know that today the evolution of shop equipment and shop methods of securing quality production at low cost is extremely rapid. A familiarity with what is going on elsewhere in the industrial world is of vital importance if the operating staff is to be held accountable for up-to-date and low cost methods of production.

Avoid Labor Turn-over

Turn-over of labor should be avoided by an organization of the business, as far as may be possible, to operate on a fairly uniform production curve throughout the year. The Design Department can here greatly help the shop by diversifying the line of manufacture so that seasonal depressions are avoided. The Financial Department can also contribute by a wise policy of furnishing the storage battery capacity of funds necessary to permit excess production during the periods of low trade demand, as against which the shop will operate at something below the peak demand when great trade activity exists.

Methods of wage payment should be such in every institution as will stimulate individual ambition and reward the individual workman according to his skill and his dexterity.

In our company we have no fixed general system of wage payment, but employ either the Halsey Premium System, piece work, or straight day work, as we think circumstances justify according to the character of operations being performed.

We have a booklet outlining the general shop practice of the company in which all methods of wage payment are carefully explained, this booklet being given to each employe at the time of employment.

The question of unionized labor is one every employer is brought face to face with, and he must reach a decision as to how he will deal with it. Every broad-gauged employer recognizes the absolute right of the individual worker to join a Labor Union if he so desires. Differences arise only as to how far the unionization should be injected into the shop, and to what extent management shall divide its responsibility with labor organization. Our company operates on the open shop basis.

The Accounting Division should provide the Direct Manufacturing Department with a detailed statement which shows, month by month, not only productive labor expenditures, but also all expense labor and expense material expenditures. The statement of expense expenditures should include that portion of general expenses—such as taxes, insurance, general administrative, etc.—assessed against the factory, and over which the factory has no control.

With the duties assigned to the Engineering and Planning Division previously referred to, it is apparent that the Accounting Division will have no great difficulty in determining with reasonable accuracy direct labor and direct material costs.

Overhead Expense a Problem

The third element of cost—overhead expense—is the one which is the most difficult for the Manufacturing Division to control and for the Accounting Division to equitably assess against the various classes of product. The Federal Trade Commission has stated that the most common cause of business failure in the United States is an absence of accurate knowledge of production costs, and at the time of their investigation, in 1917, stated that out of a quarter of a million industries which came under their examination only 5 per cent actually knew what their costs were.

How to treat the item of overhead in costs is today probably the most actively debated question with which the Accounting Division of an industrial organization has to contend. There are wide divergences of view as to the period of time over which expense expenditures should be averaged for the purpose of determining a normal overhead to be charged into current costs.

Our own practice is to take the average of a 5-year period (the current year being included), always carefully excluding any extraordinary elements of expense which would make the 5-year average artificial and not truly representative of the fair operating conditions of the business.

This specific subject has been given exceedingly careful consideration by the Standard Accounting and Cost System Committee for the electrical manufacturing industry—a committee which has for some seven or eight years been working diligently in the preparation of an accounting manual for the electrical industry. It is well worth while to quote here in full the principles governing the use of a normal overhead laid down by this Committee, and set forth in the Fourth Edition of the Committee's manual, dated Oct. 1, 1922:

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can — that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

All Size Trucks for Rent

Dump Trucks

By the Hour, Day, Week or Contract

We handle anything, anywhere

"Indirect manufacturing expenses do not fluctuate in parallel with the volume of production. Therefore, costs obtained by using a temporarily high or low percentage, or machine-hour rate (because production for the periods upon which they are based is subnormal or abnormal), are not true costs, as applied to most lines of production.

"The fiscal year is largely an arbitrary period and may not represent average conditions. Consequently, the attempt to absorb the indirect expenses in the costs of the fiscal period in which they are incurred may work injustice or entail loss. It is, therefore, sound accounting and good financial policy to recognize, in determining the cost of production, the principle of the continuity of time.

"To avoid violent cost fluctuations, normal or mean average rates based upon a cycle of years should be used in cost estimates and in costing production and shipments. It will take study and care to determine such rates and to keep them normal.

"It is recommended, therefore, that:

"(1) Normal or average rates (based on direct labor, direct labor hours, or machine rates) be established for separate departments or classes of product and used for cost estimates and in costing production and shipments.

"(2) A separate 'Reserve for indirect manufacturing expenses' be set up for each department or class of product, created primarily from amounts over-liquidated, i. e., amounts charged costs of production in excess of actual indirect manufacturing expenses, during periods of abnormal production, when the rates used in costing are higher than the actual. If the reserves established in this manner are insufficient, they may, if the Board of Directors approves, be supplemented by appropriations from surplus.

"(3) Under-liquidations of indirect manufacturing expenses, during periods of subnormal production, in any department or class or product, be charged against its reserve.

4. The necessity for a very high quality of production and expense factors be made by means of charts and statements, so that the established normal or average rates may be periodically corrected or revised as experience or conditions may require.

"(5) Inventories at the close of the fiscal year should be valued, for balance sheet purposes, upon the basis of normal rates of overhead.

"Note:—When, as a policy of conservation, an adjustment of inventory is made to the basis of current overhead cost, in those years when current rates are lower than normal rates, this adjustment should be a temporary entry to be reversed at the beginning of the succeeding fiscal period, and this practice should be interpreted as the exercise of executive conservatism rather than cost accounting procedure."

Costs on Sound Basis

The Electrical Manufacturers Council is probably the first of the large trade associations to so fully and completely clarify this question, and I entertain the opinion that their recommendations will rapidly be adoped in all well-regulated manufacturing institutions as it is so eminently a common sense treatment of the question. That this question should be clearly crystallized in the minds of industrial accountants cannot be too strongly emphasized, as in many industrial institutions commercial costs are all too frequently based upon arbitrary and unsound treatment of overhead expense, in ways which seemingly justify the establishment of low selling prices utterly unwarranted by all methods of accounting conducive to permanent business stability. Industrial accountants should, with scrupulous integrity, arrive at real and sound costs, irrespective of current market competitive prices for the plant's output. There may be justifying reasons for meeting competition which is actually below cost, but in no instances should costs be manipulated to justify taking orders below actual costs.

Too much emphasis cannot be placed on the importance of arriving at costs departmentally rather than average cost for the plant as a whole. The executive officers should know what departments are carrying themselves, and what branches of the business are continually burdensome rather than profit producing. There is a strong tendency among some industrial accountants to segregate the so-called item of "idle plant expense," a practice which tends to show, in periods of business depression, actual margins of profit in departments running below capacity which profits are never realized in the balance sheet. Idle plant and overhead is a current expense, in fact. An honest industrial accountant should so treat it, as long as the idle sections of the plant are under normal and fair operating conditions.

INSPECTION DEPARTMENT—A competent Inspection Department is very necessary to give continuous assurance of the quality of the factory output, as a defective factory output, even for a relatively short period, can injure the reputation of the company in a way that may often require years to regain.

The degree to which inspection and test operations should be carried requires careful consideration for each industry. In no instance should the inspection staff be so organized and operated as to relieve the shop foreman of responsibility for quality of product. Rather should inspection operations be so planned as to, in effect, have the actual shop production organization keenly co-operative with the Inspection Department in securing high quality of production.

The amount necessary to spend for inspection work depends, to a great extent, upon the nature of the factory layout. We have found that very much more rigid inspection is required where the factory is laid out according to the class and type of machinery, and parts from the machine departments distributed to the assembly departments for the various classes of product made. Inspection operations are much simplified, and costs reduced, where machining and assembly divisions for each class of product are segregated under the control of a divisional factory superintendent, this result being effected because the Divisional Superintendent has an intimate knowledge of the function each part produced has to play in the complete device and soon learns the practical limits to be adhered to to avoid excessive rejections and repairs. We have also found that where it is possible for the factory to be laid out in complete manufacturing units, greater

Congress Girds for Bonus—Tax Fight

Coalition of Radicals and Democrats on Revision of House Rules Imperils Administration Revenue Program

By JOHN M. TOWNSEND

Washington Correspondent, Manufacturers News

Washington, D. C., Jan. 23.—With representatives of practically every line of American business voicing their views concerning tax revision legislation in hearings before the House Ways and Means Committee; with President Coolidge expressing opposition to any proposal of compromise and standing steadfast on the principles of the Mellon Plan, and with a coalition of House Democrats and Republican insurgents victorious in their fight to bring about amendments to House rules which admittedly have a vital effect upon the successful passage of any revenue measure, the taxation question occupied the center of a lively stage in Washington last week, while here and there suggestions of increased activity for a soldier bonus arose to enliven a situation which ultimately will have a tremendous effect upon American business.

PRESIDENT STANDS FIRM.—Numerous conferences with members of Congress who have called at the White House to lay before the Chief Executive their views concerning the necessity of compromise on tax legislation, if any enactment of a bill is to be secured in the House, have so far failed to shake the determination of President Coolidge to stand by the proposal of his Secretary of the Treasury to the last ditch. Notwithstanding the attacks made upon the surtax features of the Administration measure, both by insurgents and Democrats in Congress, the President believes that the country is firmly behind the principles of the Mellon Plan—and every incoming mail brings floods of conclusive evidence on that point. Mr. Coolidge has no intention of yielding to the opposition, and has assured callers of his decision to support the present tax program in its entirety. That the taxation measure will be the subject of amendment when it reaches the floors of Congress for consideration is, of course, admitted, but at present there is no disposition on the part of the Chief Executive to permit tinkering with the fundamental principles of the Tax Reduction Plan which contemplates relief for the higher surtaxes as well as the normal tax on income.

CONGRESSIONAL COMPLICATIONS—By forcing the repeal of a House rule which restricted the offering of amendments to revenue legislation on the floor of the House itself, and in securing the adoption of a rule which provides that, upon petition of 150 members, legislation may be taken from a committee and brought into the House for immediate consideration, the LaFollette bloc and the Democrats in the House have created a situation where almost anything may happen when the tax revision measure is brought up on the floor for action. Regular Republican leaders, unable to stem the tide of the coalition, survey the ruins of their carefully mapped out plans for expediting consideration of the Tax Bill, and frankly admit that the insurgents' victory has paved the way for almost ceaseless obstructionist tactics. Countless amendments affecting the detailed items in the forthcoming bill are expected to result from the removal of the ban on such efforts, and every conceivable percent of taxation policy will be thrown into the House arena before a final conclusion is reached. And even the most pronounced optimist is unable to predict either the nature of the ultimate legislation or the time of its passage.

BONUS ADVOCATES ENCOURAGED—Another angle of the House rules situation which is arousing particular interest is its effect upon the possible consideration and passage of soldier bonus legislation. Last week, the Republican members in conference defeated a move by bonus advocates to give their legislation priority over the Mellon Tax Bill by proceeding with consideration of the bonus in the Ways and Means Committee before completing taxation deliberations. In deciding the question, the Republicans further declined to specifically recommend the passage of bonus legislation at this session, contenting themselves with suggesting that the Ways and Means Committee take up the question after concluding its work on the tax bill. This move apparently pushed the bonus question so far back on the legislative shelf as to offer little prospect of its passage before Congress adjourned in June to attend the political conventions. Here again, however, the defeat of the regular organization in the House rules fight has wrought a change in the situation. While it is expected that an effort will be made to include the bonus proposal as an amendment to the Tax Bill on the floor of the House, this move is believed to be doomed for failure, through a point of order; but there is no such certainty of a similar defeat for any move which may be made under the second change of the House rules brought about by the insurgent-Democratic fight. Any time 150 members sign a petition calling for the bringing up of a bonus measure for consideration, it could be resurrected from the House committee in which it might be temporarily pigeonholed, and the whole question thrown upon the floor of the House, regardless of the efforts of the regular Republican organization. There is not much doubt but that such a move will be attempted, and there is likewise a very decided impression that the securing of the required number of signatures to the petition could be accomplished comparatively easily, in view of the tremendous pressure which would be brought to bear upon individual Congressmen for such a move.

WAYS AND MEANS COMMITTEE WORK—Meantime, with members divided as to the advisability of agreeing to a compromise on the features of the Mellon Tax Plan, the House Ways and Means Committee spent the past week listening to the diversified views of the American taxpayer, as represented by spokesmen from various industries. Outstanding among the witnesses who urged relief from Federal taxation was L. F. Gates of the Chicago Board of Trade, who warned the Congressmen that Chicago had lost its position as the greatest grain market in the world, because of burdensome stamp taxes and Federal levies upon future trading activities in the market. Winnipeg, Man., now occupies that position, Mr. Gates said, adding that the Federal taxes had so depressed the Chicago market as to lead to the retirement of many investors from the field.

ILLINOIS WATERWAY MEASURE INTRODUCED—In a bill carrying an appropriation for $5,700,000 for the improvement of the Illinois River so as to assure a 9-foot channel, Representative W. E. Hull, of Illinois, has sought to accomplish the two-fold purpose of consummating an important link in the Lakes-to-the-Gulf waterway project and at the same time aid in the solution of Chicago's sewage disposal problems by authorizing the withdrawal of an additional amount of water through the Chicago Drainage Canal from Lake Michigan. The measure was referred to the House Rivers and Harbors Committee, following its introduction in the House itself by Mr. Hull, and consideration of the measure in the Committee is expected within a short time. In addition to providing the waterway and authorizing the increased flow of lake water, the Hull Bill stipulates that the Chicago Sanitary District shall bear the expense of levee protection work along the Illinois River, shall undertake the construction of regulating works in the St. Clair and Niagara Rievrs, and shall largely increase its activities in constructing artificial sewage disposal plants.

TRANSPORTATION

Many Class I Railroads to Protest Order to Install Electric Automatic Train Control—Cost Excessive

THE Class I railroads of the country are planning a concerted protest to the Interstate Commerce Commission against a recent ruling by that Federal body ordering ninety-six carriers of that class to install automatic train control which, it is estimated will cost approximately $150,000,000. Meetings of railroad officials have been held and plans to appear before the Commission formulated. The basis of the protest, with a request for a thorough hearing, is the prohibitive cost to individual lines, considering that no automatic device has yet been submitted which is considered beyond the experimental stage.

Under the original order of the Commission forty-nine roads were ordered to install electrical devices on at least one passenger division. At the same time a rule was issued that railroads will be fined $100 a day, beginning Jan. 1, 1925, if automatic controls are not installed.

The Committee on Automatic Train Control of the American Railway Association has taken up the last order of the Commission, which increased the number of Class I roads to immediately install these controls from forty-nine to ninety-six—all but two of the larger Class I lines, which comprise the big majority of the rail mileage of the country.

The A. R. A. committee consists of twenty members, with C. E. Denny of the N. Y. C. & St. L. as Chairman. Five members are from the Operating Departments, five from the Engineering Divisions, five from the Signal Sections and five from the Mechanical Divisions. Each of these sub-divisions has a Vice-Chairman, and G. E. Ellis of Chicago is Secretary of the Committee. The latest report of the Committee (Dec. 1, 1923) says:

"The monthly reports show that twenty-nine roads have selected a device for installation. Sixteen of these have selected the continuous induction and thirteen the intermittent induction type; no roads have reported as selecting any of the mechanical contact types except the three upon which installations existed at the time the order was issued. Experimental installations of intermittent induction type are in operation on five roads and continuous induction type on two roads.

"The divisions so selected comprise about 2,570 miles of single track road and about 2,567 miles of multiple track road. The order requires the installation of roadside apparatus on approximately 5,000 miles of road, about equally divided between single and multiple track lines."

French Line Has New Agent

The Chicago office of Furness, Withy & Co., Ltd., has been appointed General Western Freight Agent for the French Line, Compagnie Generale Transatlantique, according to an announcement by that steamship line. H. C. Wilson, is Western Traffic Manager for Furness, Withy & Co., with headquarters at 111 West Jackson Boulevard, Chicago.

I. C. Mileage in Illinois

When the Illinois Central Railroad was built in 1852-56, it comprised 705½ miles of line in Illinois. The Illinois Central System now comprises 6,200 miles of line, of which 3,990 miles are located in Illinois. The total track mileage operated in the State in 1923 was as follows:

First main track	2,068
Second main track	449
All other main tracks	163
Industrial track	240
Yard track and sidings	1,070
Total	3,990

New Rail Line in Bolivia

Progress is being made on the construction of the Atoocha-Villazon railroad in Bolivia, which it is hoped, will be completed by the time of the Bolivian Centennial in 1925. This line will be the last link in the all-rail route between Buenos Aires and La Pax, where it will connect with the Antofogasta-Bolivia Railroad to the Pacific port of Antofogasta. The Atoocha-Villazon line is being built by an American company. It is reported that construction equipment in considerable quantities will be needed after Jan. 1, 1924.

Farmers and Railroads

Some interesting light has been recently thrown upon the campaign of the farmers for lower rail rates by the Chairman of the Northern Pacific Railroad Company. Here are some of the facts he cites:

"The rate of return earned by the Northern Pacific on a sum representing the property investment, the materials and supplies, and a moderate working cash capital for a term of years has been as follows:

		P. C.
Pre-war period	1916	6.17
Pre-war period	1917	5.94
Government operation	1918	4.60
Government operation	1919	2.72
Part Go't., part owner	1920	1.47
Owners' operation	1921	1.99
Owners' operation	1922	3.53
Owners' operation to September 30	1923	2.19
At annual rate of	1923	*2.86

---

*Estimated.

Substantially the same officers and men that produced a fairly good return in 1916 and 1917 have been and still are with the property, but they cannot overcome entirely the conditions developed out of war and Government operation. For example:

The increase in wages in 1922 over 1917 was	$13,163,522
The increase in taxes in 1922 over 1917 was	1,519,854
The increase in fuel costs in 1922 over 1917 was	2,186,728
A total of	$16,870,104

These three items alone are equal to 6.8 per cent on the Company's stock.

The post-war rates authorized by the Commission increased Northern Pacific revenue approximately 31 per cent. Reductions subsequently ordered and those voluntarily made to meet commercial conditions to and including the July 1, 1922, order reduced the general level of Northern Pacific rates to less than 17 per cent above the Aug. 25, 1920, rates. Other important reductions have since been made."

Bramon Goes to Wabash R. R.

G. E. Bramon of Chicago has been appointed General Auditor of the Wabash Railroad with headquarters in St. Louis. For several years Mr. Bramon was Auditor of expenditures of the C. B. & Q. Railroad. Prior to that time he was Auditor of Freight Accounts with the same line, having been in the service of the C. B. & Q. for something over twenty-one years. He has also been active in the Accounting Division of the American Railway Association.

Baldwin Shipments of Engines

Baldwin locomotive shipments for December, on the present basis of deliveries, will run between $9,000,000 and $10,000,000, which will bring the total for 1923 to $102,000,000. About 14,000 men are on the payroll, as compared with 16,000 at the beginning of the month and 21,500 at the high point of the year. Orders continue dull and January operations may be reduced to around 25 per cent unless new business develops.

CHICAGO LOSES CONVENTION—For
e first time in two decades, Chicago will
without a national political convention
is year, as the result of action by the
emocratic National Committee in agree-
g with their Republican opponents that
at city should be deprived of the honor
entertaining their quadrennial meet-
g. When the Republican Committee “lost
e habit” which had brought their conven-
on to Chicago five successive times, Illi-
ois Democrats pressed the advantages of
eir city upon the Democratic Committee,
ithout avail. When the final show-down
ume, San Francisco and New York were
ound to be the main contenders for the
onor, and, after three ballots, the Eastern
ty won the prize, and will entertain the
emocrats, beginning June 24th.

HURLEY APPOINTMENT PLEASES—
he announcement of President Coolidge
at he had selected Edward N. Hurley, of
hicago, to be a member of the World War
ebt Commission, was greeted with gen-
ine satisfaction in Washington. The value
f Mr. Hurley's service as Chairman of the
nited States Shipping Board during the
ar has been universally recognized, and
is re-entrance into the official Washing-
on field is welcomed. His business experi-
nce and sound judgment make him eminently fitted for his new post as member of the organization which is called upon to decide upon the terms and conditions of the settlement of foreign nations' war debts to the United States.

Freight Rate Cut No Aid to Farmer, Says Markham

(Continued from page 6)

If it is not so maintained, the farmers and other business men of the country will be the sufferers.

In order to raise capital through sales of stock, the railroads must be able to show an earning strength after payment of expenses, taxes and interest charges that will convince investors their money is safe in the railroads; obviously the attitude of the public must be such as will permit these net earnings to be realized.

Business has been passing through a period of readjustment since the war. The recovery of agriculture has been slow and is not yet fully accomplished. Railwaymen can appreciate the feeling of the farmers on this subject, for the railroads also have been struggling back to normal against similar odds. In fact, the railroads as a whole have suffered from the disjointed times just as much as have the farmers as a class. There have been isolated exceptions in each case—some railroads have done better than others, and some farmers have prospered while others have failed—but the agricultural and railway situations in the main have been close to parallel. Of the 189 Class I railroads in the United States, 106 do not pay any dividends at all.

Public opinion reflects too much pessimism about the railroads and agriculture. I do not share it as to either industry. Both have made great strides in the last year. The general level of prices for farm products is higher than a year ago, and there have been some reductions in farm operating costs. Business has been exceptionally good, and this alone is proof that neither the agricultural industry nor the railway industry is tottering on the bank of disaster. It is true some farmers have not shared in the general distribution of prosperity, and the same is true of other lines of business, including the railroads.

Let us bear in mind that these two major industries are indissolubly linked together and that both must prosper if either is to have lasting prosperity. Some individuals are endeavoring to convince the farmers that their welfare lies in attacking and obstructing the railroads. They are not the farmers' true friends. If their leadership is followed, the post-war recovery of the railroads and agriculture, which has already made such striking progress, will have a setback. But if the farmers will consent to work with the railroads along constructive lines for the betterment of the business structure as a whole, the entire public, including the railroads, agriculture and all other lines of business, will be benefited.

ILLINOIS NORTHERN
RAILWAY
AND CONNECTIONS

Manufacturing Locations for Sale

Along the lines of the Illinois Northern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Illinois Northern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

FOREIGN TRADE

Thorough Understanding of "Foreign Exchange" Is Imperative for a Safe and Profitable Export Trade

A KNOWLEDGE of foreign exchange and the correct understanding of how to use it is imperatively necessary for the safe and profitable conduct of iternational trading. Once understood, is simple in its application to our export ipments.

Comparatively speaking, there are few merican business firms that thoroughly nderstand the usefulness of Foreign Ex-ange as a protection against the fluctua-ons and depreciations of foreign moneys.

Because of the fluctuations of foreign urrencies, American exporters have insist-d on selling their products to the foreign-rs payable in the United States dollars. his the foreign buyer has refused to do, xcept when necessity compelled other-ise. European nations have followed for century a policy which has enabled them o build up their trade relationships with ther nations.

England, Germany and France trade with other nations in the currency of the country where the purchases are made, knowing full well that the contracts of purchases or sales can be absolutely safeguarded, by the buying or selling of exchange to protect such transaction.

In other words, exchange makes the transaction 100 per cent safe against the rise or decline of the foreign money.

If the foreign buyer wants your merchandise, payable in some exchange other than United States dollars; if the price is O.K. and the terms of payment and credit arrangements satisfactory, why debate the question? Here is an illustration:

You sell merchandise in Brazil and the purchaser furnishes his trade acceptance with banker's guarantee, payable in milries. On the day the sale is consummated the invoice will amount to, say, 50,000 milries, which is equivalent to $5,000 in United States money (the amount you based your bill of sale upon). You should at once protect your $5,000 by selling (exchange) milries. Regardless later of what the milries are worth, even should they decline 50 per cent when the acceptance is paid at the Brazilian end, you will receive the amount of milries equivalent to your $5,000 United States money, and those 50,000 milries, if that be the exchange rate on that date, will have a purchasing power of $5,000 in United States money. The same method applies to any country you might be dealing with whose currency is quoted each business day in the United States exchange market.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

ALGERIA—8874, canned asparagus; canned fruits; fruits, dried.

AUSTRALIA—8909, novelties, electrical; 8886, pianos, knocked-down, walnut or rosewood veneer.

AUSTRIA—8891, buckles, all kinds, for garters, suspenders, etc.; 8887, bone fats; lubricating oils; 8914, lithographing machinery; playing cards manufacturing machinery; printing machinery; paper; paper box manufacturing machinery; 8887, rosin; starch; turpentine; washed sulphur.

BELGIUM—8869, pitch, coal, 1,000 to 1,500-ton shipments.

BOLIVIA—8910, accessories for making candy kisses; candy manufacturing machinery.

BRAZIL—8912, machinery for manufacture of fiber products from sugar cane bagasse.

BULGARIA—8907, windmills.

CANADA—8919, gum, candy coated, ball; 8868, plaster, wall; plaster, finishing.

CZECHOSLOVAKIA—8866, automobile accessories; motorcycle accessories.

DENMARK—8875, advertising signs.

ESTHONIA—8889, calculating machines; fountain pens; gramaphones; penknives; scissors; typewriters.

GERMANY—8882, bacon; 8883, bacon; 8880, bacon; 8882, canned condensed milk; 8884, canned fruit; canned fish; canned milk; canned corned beef; 8918, canned goods; 8880, corned beef; 8918, corned beef; 8882, corn meal; 8913, corn sirup; 8882, corned beef; 8913, chocolate blocks; 8913, cartons for popcorn cakes; 8918, fruits, dried; 8882, flour; 8913, flavoring extracts, 8882, grits; lard; 8883, lard; 8880, lard; 8918, lard; 8880, maragarine; 8882, premier jus; 8913, popcorn delicacy manufacturing machinery; 8913, popcorn; 8920, seeds of white beans, peas, etc.; 8882, sugar; 8913, sugar; 8897, sweat bands for hats; 8883, tallow; 8913, waxed paper.

GREECE—8911, broom-making machinery; grinding machines for valonia and pine bark for tanning.

IRELAND—8900, ice cream mixing and freezing machinery; 8888, shot guns, single and double barrel, for sporting purposes, also ammunition; 8900, soda fountains with carbonating and ice apparatus; 8900, sundries, complete line for soda fountains.

ITALY—8917, belting, leather; 8913, belting, camel hair; 8873, canned salmon; canned corned beef; cheese; 8883, canned condensed milk; canned sweet milk.

MOROCCO—8916, soya bean oil.

NETHERLANDS—8923, office supplies; stationery goods; school supplies; 8931, underwear, fleeced.

NEW ZEALAND—8878, beans, white navy, highest quality seeding stock; 8894, costumes, ready-made; dress materials; hosiery; 8879, flake cut tobacco; plug tobacco; 8894, ready-made dresses.

NORWAY—8885, radio material for amateurs.

PERU—8921, cotton gin.

SOUTH AFRICA—8922, tennis rackets.

SPAIN—8892, meters for electric power and electric lighting.

SWITZERLAND—8890, casters, chair and table.

URUGUAY—8898, paper, writing and printing, 34,000 kilos.

Patents "Intellectual Property"

An Italian decree, effective Sept. 29, reported to the Department of Commerce, introduces certain changes in the Italian patent laws, principally with reference to the duration of the patent, the fees payable, and the organization of the patent office. All matters relating to patents, trade marks, designs, models, and copyrights, will fall under the jurisdiction of the Office of Intellectual Property, which is under the Ministry of Industry, Commerce, and Labor. Patent rights will now run for a period of fifteen years from the date of application. Formerly patents were granted from one to fifteen years at the election of the patentee.

The following fees are charged in connection with obtaining and maintaining patent rights: application, 100 lire; an annual tax beginning with 50 lire for the first year, and increasing by 50 lire for each succeeding year; a special tax of 100 lire, in addition to the application fee, for additions to or modifications of already existing patents.

The terms of the present decree will apply to patent rights already obtained; but taxes previously paid in accordance with the laws and rules then established will stand good and valid. Those taxes which are unpaid will have to be settled in conformity with the terms of this decree. Patentees holding patents which have been granted for a period of less than fifteen years, may continue to enjoy their privileges until the expiration of a total period of fifteen years, taxes to be paid in accordance with the provisions of this decree.

Czechoslovakian Fair in 1924

A foreign fair of interest to manufacturers in the United States scheduled for 1924, will be the eighth Prague Sample Fair, to be held at Prague, Czechoslovakia, March 16 to 23.

SALES MANAGEMENT

Territory—New and Old; Salesmen On and Off the Road; Campaigns and Quotas, Discussed for Sales Managers

By CHARLES M. HOLMES

Vice-President and General Manager,
W. M. Welch Mfg. Co.

IN the last issue of MANUFACTURERS NEWS Mr. Holmes discussed the question of building sales campaigns—sales planning, in other words. In the following article he takes up the question of territory—new and old—how to handle salesmen at the office and on the road, sales conventions, special campaigns and quotas, etc. This article is an abstract of the latter part of his speech and the last installment of Mr. Holmes' address before the Chicago Sales Managers' Association.

NOW we pass on to the question of territory. This is a very broad proposition because it brings up the question of new territory and old territory. You have the established territory in which you are selling, and your sales analysis will show just how hard you need to push in that section. In studying this proposition you must consider the class of people living in a certain state or community; whether it is sparsely settled or congested; whether the people are wealthy, of moderate means or poor; and also the question of nationality.

Then there is the question of whether you are going to have your men work out of the main office or whether you will establish branch offices, and that affects the question of how you are going to handle your territory. Then here comes the question of the future growth of your business in a certain territory. How much you are going to push there and here?

Then the problem confronts you of the handling and controlling of your men in the field. What is your problem there? It seems to me one of the biggest is to make a man work a full day every day. Take Christmas week. What is your man going to do the day before? Is he going to start out to sell your product or is he going to stay home until noon, pack his grip and catch the evening train? Will he work the day after Christmas? It is a big problem to school your salesmen so they will use every available minute to sell your merchandise, and the question of how your salesmen start is very important. Is he going to start with a determination to sell your product or is he going to say, "Well, perhaps it does not make any difference whether I do, because yesterday I made an unusually large sale." You must keep that proposition of starting a man out right before the salesman constantly—the necessity of fighting for business.

You must help your salesman, not only with the people he sells, but with those he fails to sell. It is easy enough for a man to feel content when he has made good by selling; but how is he going to feel if he has to visit five or six customers and has not been able to sell? That is a problem that seems well worth consideration.

What is your method of handling your men in the field? How do you route them? This is very important. Do you get daily reports, not only of the amount of time expended but the amount of sales they make, customer calls, and the prospects? You want them to turn in reports that will keep you in constant contact with them, but there is one thing to remember in connection with these reports—they are not worth the paper they are written on unless the office does something with them; in other words, unless you follow up those reports.

In connection with handling salesmen on the road, there is one way a Sales Manager can keep in touch with them, and that is by inspirational letters. Recently we had before the Executives' Club of Chicago, Mr. E. Elmo Martin of Cleveland, who said that appreciation is far better than depreciation. If, when your salesman makes an unusually good sale you shoot a letter to him, possibly of only four lines, complimenting him, what does it mean? It means he is inspired to go forth and continue the good work for you.

The Sales Manager should not only have his salesmen send in adequate records of what they are doing but he himself must keep adequate records. If we can have our records adequate so that when a problem comes up we can meet it and answer it quickly, it well be very much better for the business.

Territory records—you all know about the map and tack system, probably all of you use it. Those systems give you a graphic view of accomplishments. Then posssibly you have a chart record showing the comparative results in various territories, not only showing the volume of sales, but the ground covered, the location of the various customers and of prospects.

What will be your plans for a regular and special sales campaign? What will they include? Your plans should include particularly those things that will keep your salesman constantly alert and in touch with what the house wants. That should, of course, include sales conventions. Why do we have sales conventions? Because we want to inspire and build up our salesman. But if they are too long we defeat their very object, because the salesman gets tired and he has not been inspired to go out and sell more merchandise.

In planning regular and special campaigns there is the question of contests. They must first be short, not over one to four months in length, and, of course, offer attractive prizes—not always money but many times clothing, not only for the salesman but for the salesman's wife and his children. Also establish a definite quota in these contests, depending on what had been accomplished previously.

On the question of sales quota, it is obvious that no definite lines can be laid down, because of the variety of merchandise that is offered for sale; but general plans can be considered, and, as a rule, there are a few things in these sales quotas that are adaptable to all lines of merchandise. The question is simply a proposition of having a mark to shoot at.

But, in making a quota, we must be sure we make one that a salesman can meet and exceed, because if you make the quota too high a salesman will become discouraged. You should consider what has been done before and set the quota at the proper amount. This quota proposition must be absolutely tied up and wrapped up in the question of what you are going to pay your salesman. His compensation should depend on how he makes good on this quota, and your quota is going to depend on not only population but the number of jobbers, dealers, wealth of a community, civic and industrial and other activities of a community, and—do not overlook this—the type of man who is going out to sell your merchandise.

A great many companies, I know, in answering correspondence are using form letters and say "Paragraph four, six and eight" to this customer and "Paragraphs two, ten and thirty-two" to the next man. They are well-written paragraphs, undoubtedly, but the question oftentimes is, do they apply?

There is one last thing to remember, and that is that a sale is never completed until the customer is entirely satisfied; in fact, all efforts prior to complaint in getting an order and shipping goods, will absolutely count for naught if a complaint sent in is not handled promptly or satisfactorily adjusted.

The Artistry of Good Taste

THE Congress has no formula which assures the complete satisfaction of all its guests, but it has profited from experience. For many years this hotel has been famous for the manner in which it strives to please everyone. Its executives have learned there is but one phase of service which always appeals; that is Good Taste. The Congress employs the artistry of Good Taste.

AUTOMOBILE—AVIATION

Total Automobile and Truck Production in 1923 Was 4,005,230 Cars—Wholesale Value Set at $2,510,885,000

FIGURES covering production of automobiles and trucks for 1923 have been tabulated by Alfred Reeves, General Manager of the National Automobile Chamber of Commerce, showing a new record had been set during the past year of 4,005,230 machines. This compares with the previous record of 2,659,064 in 1922, or an increase of approximately 50 per cent. About 370,000 of the 1923 production were trucks.

Of the total production of cars, 1,235,000, or 35 per cent, were closed cars. The total wholesale value of the cars is put at $2,243,385,000, and of the trucks $267,500,000, giving a total value of the output of the industry at wholesale quotations of $2,510,885,000.

There were produced 45,000,000 tires during the year, having a wholesale value of $760,000,000. Other parts and accessories involved $1,310,000,000. The average retail price of a car during the year was $811 and of a truck, $1,080.

Mr. Reeves places the purchasing power of the dollar in the automobile industry at $1.11, compared with a base of 100 in 1922. The number of employes in the motor vehicle and allied trades is put at 2,750,000. Special Federal excise taxes paid by the industry is placed at $155,000,000.

Output during December exceeded December a year ago by 30 per cent, when the total production was 228,092. A decrease of 5 per cent from November is shown in the figures. December, 1922, was 4 per cent under the preceding month.

1,000,000 Dodge Cars

One million cars built and sold in the first nine years and eleven days of production. This is the latest achievement of Dodge Brothers, Detroit, who thereby add another to their long list of notable contributions to the automobile industry.

Dodge Brothers began production on Dec. 4, 1914. Car No. 1,000,000 rolled off the final assembly line Dec. 13, 1923—9 years and 11 days later.

While factory officials are pleased at the attainment of the one million mark in so brief a period, they attach far greater importance to the fact that more than 90 per cent of the first million are still in service.

This is the point that interests the public, they maintain, for it is emphatic evidence that quality production has always had preference over quantity production in Dodge Brothers Works, even when the most heroic measures were being adopted to increase plant capacity to meet the increasing demand.

General Tire Elects Officers

The General Tire & Rubber Company's annual election of officers has resulted in a number of promotions, with William O'Neil, formerly Vice-President and General Manager, the new President of the Company. He also retains the General Managership.

C. J. Jahant, Superintendent, and W. E. Fouse, Secretary, were elected Vice-Presidents, and T. F. O'Neil, who has been a member of the Board of Directors for some time, was appointed Secretary of the Company.

Chicago's Annual Automobile Show

COLISEUM

Jan. 26—Feb. 2

M. O'Neil, who has been President since the organization of the Company, gives up that position but remains Chairman of the Board. Charles Heberich was re-elected Treasurer, W. E. House, Assistant Treasurer, and W. J. Cahill, Assistant Secretary.

Franklin Car Under 1913 Price

"Franklin car prices today are 32 per cent under our 1913 price level," says H. H. Franklin, President of the Franklin Automobile Company. "The significance of these figures is more apparent when viewed in the light of some statistics recently prepared by the Cleveland Trust Company, Cleveland, O., and which show that the average price of twenty-five standard makes of passenger automobiles is now 10 per cent below the pre-war level of 1913."

General Motors Changes

Alfred P. Sloan, Jr., President of General Motors Corporation, announces the following changes in organization and personnel:

W. S. Knudsen, in charge of operations of Chevrolet Motor Division, has been appointed General Manager of that Division. Colin Campbell, General Sales Manager, has resigned. C. E. Dawson, Assistant General Sales Manager, has been appointed Acting General Sales Manager.

Armstrong Spring Company of Flint, Mich., has been purchased and becomes the Armstrong Spring Division. R. T. Armstrong has been appointed General Manager.

Paste This on the Wind Shield

Fewer automobile accidents would occur if motorists traveling the streets and roads of the country realized the tremendous amount of ground they cover per second even within the speed limit. A lately compiled table reducing speed to feet traveled per second, follows:

10 miles per hour covers 14.66 feet per second.
15 miles per hour covers 22 feet per second.
20 miles per hour covers 29.33 feet per second.
25 miles per hour covers 36.66 feet per second.
30 miles per hour covers 44 feet per second.
35 miles per hour covers 51.33 feet per second.
40 miles per hour covers 58.66 feet per second.
45 miles per hour covers 66 feet per second.
50 miles per hour covers 73.33 feet per second.
55 miles per hour covers 80.66 feet per second.
60 miles per hour covers 88 feet per second.

Try This on Your Automobile

The best way to start a motor when the electric starting system refuses to work and the crank has been left in the garage, is to jack up one of the rear wheels and turn it by hand with the clutch in and high gear engaged. The spark should be retarded and only a small throttle opening allowed. Before removing the jack the gears should be shifted to neutral again.

Buick to Spend $11,000,000 in 1924

In order to bring its production capacity to 1,200 cars a day the Buick Motor Company will expend $11,000,000 in new buildings, additions and equipment for its main plant at Flint, Mich., and its subsidiary plant at Detroit, according to an announcement by President H. H. Bassett.

Waterways Are Vital to Industry of Middle-West

(*Continued from page 8*)

gation. That such regulating works are practicable has been demonstrated by the success of the regulating works in the St. Mary's river to maintain the level of Lake Superior from diversion for power purposes at the Sault.

That our treaty with Great Britain and Canada does guarantee to us the right to divert from Lake Michigan through the Chicago, Illinois and Mississippi Rivers, 10,000 cubic feet of water per second, there can be no question. The diversion of this water through improved channels will insure cheap water transportation from the Great Lakes through the greatest productive area in the world and out to the sea. The improvement of the tributaries to this great waterway will provide cheap transportation to the products of the farm, the factory and the mill of the whole Valley and will thereby develop resources and enormously increase the tax-paying wealth of the nation. There is pending in Congress a bill providing for the completion of the adopted waterway projects in the Valley within a period of five years, and a bill enlarging the operations of the barge lines; these bills should be enacted into law. The country is staggering under a great national debt, the interest upon which is greater than the total expense of the Government before the war began. In addition to this, after practicing every economy of administration, our current expenses are enormous. To meet these obligations revenue must be made available. Our revenue can only be increased through the development of our resources. Our resources will not develop unless adequate and reasonable facilities for transportation are made available, and such facilities can only be made available by the development and use of our waterways.

BUSINESS AND FINANCE

Tax Returns, Tax Payments and Reports Required by Illinois and Federal Laws—Aid to Busy Business Men

Dates Returnable or Payable	Nature of Tax or Report	Payable or Returnable to	Explanation
Jan. 1 to Jan. 15, annually	(1) Employers' report on number of employes, etc.	Director of Labor, Springfield, Illinois.	Must be filed by all employers of five or more persons. Blanks furnished by Illinois Department of Labor.
Jan. 1 to Mar. 15, annually	(2) Corporation income and profits tax report and payment.	Collector of Internal Revenue.	For calendar year preceding. Payable not later than March 15 or in equal quarterly installments not later than March 15, June 15, September 15 and December 15. Forms 1120 for Corp.; 1040 and 1040-A for individual.
Jan. 1 to Mar. 15, annually	(3) Personal Federal income tax report and payment.	Collector of Internal Revenue.	
Jan. 1 to Mar. 15, annually	(4) Annual information return by corporations (form 1096 or 1096-B) of payments of interest on bonds, salaries, etc.	Commissioner of Internal Revenue, Washington, D. C.	Similar report must be filed concerning your personal payments in excess of $1000 (forms 1096 and 1099 must be filed simultaneously.)
Feb. 1 to Mar. 1, annually	(5) Illinois Corporation report must be filed by all Illinois corporations organized for profit for year ending preceding Dec. 31.	Secretary of State, Springfield, Illinois.	On basis of this return each corporation is required to pay a license fee or franchise tax of 5c on each $100 of the proportion of its authorized capital stock represented by business transacted and property located in Illinois. If you do not receive blank by January 20, write to Secretary of State. Penalty of $20 for late filing.
Mar. 1 to July 1, even years	(6) Census of manufacturers.	U. S. Department of Commerce.	Returnable every other year ending in even figures (1922, 1924, etc.), covering preceding year.
March 1 to June 1, annually	(7) Personal property returns.	Board of Assessors.	Such returns are required to be filed in all counties in which the offices or plants of corporations are situated within (ordinarily) five days after receipt of schedule by the corporations and others during April and May.
April 1 to May 1, annually	(8) Real Estate Tax.	County Tax Collectors	Payable in counties where corporations or individuals own real estate.
April 1 to July 1, annually	(9) Capital stock assessment returns.	Local Assessors.	This return applies to the tax assessed on the excess value of capital stock over assessed valuation on the tangible property. The return must be made when required by assessors. There shall be no difference between the scheduled value of shares and the combined value of real estate and personal property. Manufacturing, mercantile, mining, publishing and stock raising corporations are assessed by the local assessors.
May 1, annually	(10) Chicago City Licenses.	City Clerk.	Vehicle license and fees charged certain plants.
July 1 to July 31, annually	(11) Franchise or License tax for Illinois Corporations.	Secretary of State, Springfield, Illinois.	This tax is based on the return filed between Feb. 1 and March 1. (See No. 5.)
July 1 to July 31, annually	(12) Federal capital stock report and tax on domestic corporations.	Collector of Internal Revenue.	A report to the collector on a blank provided for the purpose (Form 707) must be filed not later than July 31. The tax is not payable until the assessment has been made and the corporation notified. The rate is $1 for each $1000 of fair average value of capital stock in excess of $5000. Tax must be paid within ten days thereafter. Penalty of $1000 for failure to pay tax.

Incomes in Canada

Canadian income tax returns covering the fiscal year ended March 31, 1923, show that 380 persons paid a tax on personal incomes of $50,000 a year and over. Of these 328 lived in the provinces of Ontario and Quebec. Persons with incomes of $50,000 or more paid a little over 25 per cent of the total personal income taxes. There were 8,615 Canadians who paid taxes on incomes of $10,000 a year and more. This group paid 62 per cent of the personal income tax collections. A group of 13,030 persons paid taxes on incomes of from $6,000 to $10,000, while 146,178 persons paid taxes on incomes from $1,000 to $6,000.

U. S. Tax Receipts Fall

Tax collections of the Internal Revenue Bureau during the year ended June 30, 1923, were $2,621,745,227, or 18 per cent less than those of the previous year, when they amounted to $3,197,451,000. The reductions, Commissioner David H. Blair said in his annual report, were due largely to the decreases of tax rates made by law.

Costs of the collection of the Government revenue from taxation are mounting while the yield is steadily declining, according to Commissioner Blair in his annual report. He reported a decrease of nearly $576,000,000 in the Federal revenue from taxes during the year and an increase of 82 cents per $100 in the cost of collecting.

Trust Companies to Meet

The fifth Mid-Winter Conference of the Trust Company Division of the American Bankers' Association will be held at the Hotel Commodore, New York City, Feb. 13 and 14.

Establishing Foreign Sales Agencies

In the past three years, the Central Trust Company, through its foreign trade division, has assisted its customers in the establishment of scores of foreign agencies, which have resulted in thousands of dollars' worth of business for those customers. We have a number of customers abroad, with whom we co-operate in all their purchases in this country and our recommendation of suppliers largely governs this business.

A connection with our Foreign Department will prove of value to you in the handling and development of your foreign business.

How to Build Industrial Production; Labor a Factor

(*Continued from page 14*)

economy can be effected in the cost of inspection and accounting by grouping employes according to the device produced and basing wage compensation on the completed device.

CONCLUSION—With proper co-ordination, as well as organization, of the several divisions of a manufacturing enterprise, smooth production in volume with high grade quality at reasonable cost is assured.

In the business with which I am actively identified, the necessity for clearly defined organization is obvious to anyone immediately upon stepping into the plant.

We have—

1. A widely diversified product.
2. A product undergoing constant evolution in design, as the whole electrical industry is in a state of constant evolution.
3. A great number of orders of relatively small individual price.
4. The necessity for a very high quality of workmanship.
5. The harmonious employment of both male and female labor.
6. Competition based upon a technical and scientific development of all types of men in the business, not surpassed in any large industry.

We have been compelled to study closely the production methods of all the best organized industrial institutions of the country, and to apply economically such principles of organization culled from this study as were adaptable to our needs.

We have secured a low cost of manufacture comparable with the best institutions in our field.

What we have is open to the inspection of all of our neighbors and friends. We hold ourselves always ready for an exchange of experiences. We invite you all to come and visit us.

Farm Problem Conference

Farm policies on legislative problems are to be formed at the Mid-Winter meeting of the National Board of Farm Organization in Washington Feb. 12 and 13, according to Chairman C. S. Barrett. The organization claims a membership of about 800,000 farm families. Questions to come before the meeting, are the plight of the wheat farmers, freight rate reductions, rural credit facilities, legislation to insure truthful branding of woolen fabrics, seeds, fertilizers and feeds, taxation and the soldier bonus.

Clothes washed by Thor last longer

Thor laundered clothes wear longer and appear fresher. When washed in dubious surroundings and handled by uninterested strangers they do not receive the care which gives them long life. A Thor in the home saves you many dollars and your wife many hours. It keeps your clothing free from contact with other washings and does away with expensive replacements of lost garments. Thor launders for you quickly, economically and efficiently. See it in operation today—you'll understand its superiority.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

ELECTRIC railways of the United States had a most prosperous year in 1923, all conditions taken together, according to Britton I. Budd, Presi- t of the Chicago Elevated Railways and sident of the American Electric Rail- Association. Passenger records for time were broken, he said, with a grand il of approximately 16,000,000,000 ers, and receiverships decreased. Fares reased slightly, about one-fifth of a cent r 1922, and now average 7.14 cents for entire country.

'Operating revenues have increased 2.5 cent over 1922, but increased wages, terial costs and taxes and slightly reced fares have offset them to an extent," . Budd said. "Operating ratio is up m 72.82 in 1922 to 73.72 in 1923.

"Wages, which constitute 46.2 per cent all electric railway operating expenses, ve risen steadily since last Spring. The erage maximum wages paid by eighty-five presentative companies, each of which erates more than 100 miles of track, d increased from 52.84 cents an hour January to 54.74 cents on Dec. 1. Maial and supply costs have advanced about per cent during the year. Taxes have sen 2.43 per cent.

"Fares generally are about one-fifth of cent lower than they were in 1922. The tional fare range in 649 cities is from 5 10 cents. A total of 173 cities have a cent fare, 150 a 10-cent fare, 83 a 6-cent re and 52 a 5-cent fare.

"Companies are coming out of receiverips rapidly. During 1923 properties ith a total mileage of 832 and total curities of $266,588,946 recovered to this tent. Companies going into receiverships iring the year had only 218 miles of track id outstanding securities of $23,609,700. he contrast between this record for 1923 id that of 1919, when companies with curities of approximately $535,000,000 ent into receiverships, is striking."

There were twelve receiverships during ie year, the fewest in any year since 1910. he total number of companies lifted out f receivership or otherwise removed from ankruptcy was thirty-one.

Electric Lines Expanding

Electric railways purchased 4,029 new ars and locomotives in 1923—more than any other year since 1913 and 14 per ent more than in 1922. In addition they ebuilt 1,256 cars and purchased 621 notor busses, according to figures comiled by the *Electric Railway Journal*. They uilt and rebuilt 1,114 miles of track—nore than in any other year since 1915. Of his, 260 miles was extension of lines, which s the most in any year since 1919.

Though many felt that the advent of the bus spelled the doom of the electric road, the railways are not only extending their lines, but are taking up the bus as an auxiliary and feeder.

The electric railways expended $282,000,000 during 1923 in the purchase of new plant and equipment and maintenance materials. For the same items they plan to expend $262,000,000 in 1924. Of these amounts $180,000,000 in 1923 and $150,000,000 in 1924 may be said to be for improvements and expansions.

Utility Stocks Authorized

Public utility companies of Illinois were authorized to issue $371,690,186 in securities during 1923 by the Illinois Commerce Commission, according to the annual report of the Commission. Of this amount $140,913,245 was in capital stock and $230,876,941 in bonds, notes and other securities. Fees charged by the commission on these issues amounted to $186,682.

One hundred and thirty-five highway crossings in the state were ordered protected by the commission during the year. Subways and overhead crossings were ordered in many instances to make the crossings safe, and in other gates, watchmen and wig-wag signals were ordered.

General Electric's Orders

Orders received by the General Electric Company for the year ending Dec. 31, 1923, amounted to $304,199,746, compared to a total of $242,739,527 for the year 1922, or a gain of 25 per cent, according to a recent announcement by Gerard Swope, President of that concern. For the fourth quarter of 1923, orders totalled $74,452,442, as compared with a total of $66,568,333 for the corresponding quarter in the year 1922, or a gain of 12 per cent.

Ohio Utilities Raise Huge Sums

Ohio public utility companies during 1923 were forced to raise new capital to the amount of $109,760,935 for the purpose of continuing and expanding their facilities for furnishing the people of the state with electricity, gas, telephone and other public service necessities, according to a report of the Ohio State Public Utilities Commission, which authorized that amount of new capital securities.

Of the total amount of new capital required by the public utility companies during the year just ended, $81,921,313 was represented in bonds and notes, while $27,839,622 was stock.

Telephone companies of the state were authorized to expend $9,052,090 in new capital during the past year, gas companies $8,813,400 and electric railroads $7,482,020.83.

HUMAN FACTORS
in Telephone Service

IT takes a lot of people, working together intelligently and harmoniously with the best telephone equipment, to give good telephone service.

The engineer who plans the work, the construction crews who build, the operators who give the service, the maintenance forces who keep the equipment in good order—all these and many others co-operate to make Bell service the marvel of efficiency which it is today.

There are 24,000 Bell telephone employees in Illinois and more than 250,000 in the country at large co-operating to give to the American people the best telephone service in the world.

QUALITY, PREPARATION
AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

To Better and Increased Business

Letters of high character are more productive and cost no more.

Forty years of experience and service have equipped our organization to produce effective result-getting literature and direct mail campaigns.

We are fully equipped to do any kind of printing or letter work.

Our mailing lists are up to date, which insures maximum results.

We will fold and mail, relieving you of all the details at less cost than if done in your organization.

Creating business where your market is can only be done by careful analysis, effective sales copy and proper presentation. Our Staff and Craftsmen will gladly serve you.

A Real Investment!

A site with a very promising future

The Best Warehouse or Manufacturing Plant Site Available in the Erie Street Business District

The above property, 86'9" x 217'7", approximately 18,500 sq. ft., is served by C. M. & St. P. R. R. DIRECT SWITCH (not alley switch) and by Chicago Tunnel Co.

Property fronts on Erie St. between Sprague, Warner & Co.'s building and J. B. Inderrieden Co.'s building, extending back to Huron St., 217'7" on Roberts St.

Located within 1 mile of the City Hall.

Easily accessible to Loop, Surface Lines, Elevated and C. & N. W. suburban transportation.

Reliable engineers have recently informed us that a reinforced concrete eight-floor warehouse building can be erected on this site, making the rental cost about 35 cents per sq. ft. (approximately 127,000 net sq. ft.).

Yielding about 7½% on the investment with liberal depreciation charges considered.

N. B.—Note especially that the property is now occupied (in part only—as shown by arrow), on the Roberts St. side, by a very substantial 3-floor building which can be remodeled and enlarged at small additional cost, and made to serve about 40,000 sq. ft. of available floor space.

Mercantile Brokers' and Manufacturers' Agents—Attention

FOR RENT—Three Bright, Ground Floor Offices, with heat, in our new building, shown to the right, in picture above.

One $50.00 per month—One $75.00 per month—One $75.00 per month

These offices may be had singly or together (No warehouse space available).

Making Light of Communism

THE Des Moines, Iowa, *Tribune* criticizes Fred R. Marvin of the New York *Commercial* because Mr. Marvin apprehends danger from the growth of communism in this country. He was one of the speakers at the recent Farmer-Manufacturer Convention held under auspices of the Illinois Manufacturers' Association in Chicago.

Mr. Marvin told the delegates that there is in this country a well-organized, skillfully managed and sufficiently financed movement having for its purpose the overthrow of the government and the confiscation of all private property by blood revolution.

Commenting on this summing up of the situation, the Iowa editor says:

> **"Except that the communists in this country are not numerous, not well organized, not skillfully managed and are practically stone broke, Mr. Marvin's assessment of the danger is a marvel of accuracy."**

Before a small but highly organized body of Reds succeeded in enslaving 130,000,000 people, there were several thousand of the Russian intelligentzia who refused to believe that any organization of revolutionists could overthrow the Czar and wipe out personal property rights, turning the property of the thrifty over to the sans-culottes. Thousands of the intelligentzia, who fully believed that communism was a bugaboo of straw and papier-mache, either were stood up against a wall and shot, managed to escape from Russia after almost incredible hardships, or were put to work sweeping the streets, cleaning out the sewers or other menial work.

We do not know what the Editor of the Des Moines, Iowa, *Tribune* would have done if he had been caught in Russia, when the late M. Lenin and Trotsky assumed charge. Possibly he might have gotten a job blacking the boots of the commissars. He would not have been needed as an editor, because the communists appropriated all the easy jobs and still have them.

The Workers' Party of America, which is the American Communist organization, held its last convention in Chicago, which is the center of radicalism in the United States. The feature was the receipt of an important letter from Moscow urging the organization of communist units in every factory in the United States. Copies of the letter were sent to every member of Congress. It was signed by Kolarow, General Secretary of the Executive Committee of the Communist International.

Secretary of State Hughes charges that Soviet organizations are disseminating propaganda in this country. Senator Lodge of Massachusetts, in a recent number of the *Congressional Record*, devoted several pages of fine type to an exposure of the extent of the workings of communists who are seeking to undermine American institutions. Possibly Secretary of State Hughes and Senator Lodge, and former trusted officials of the Soviet who are now in this country exposing the designs of the Red Republic on America, do not know what they are talking about. We think they do. We do not believe in getting too excited over communism in our country. Neither do we believe in sticking our head in the sand, like the ostrich.

Who Is To Blame?

IN placing the responsibility for the terrible mine catastrophe at Johnson City, in Williamson County, last week, those in authority should not fail to take into consideration the fact that the Miners' Union has drafted practically every bill having to do with the mining of coal in Illinois for twenty-five years, and has jammed them through the Legislature under the pretext that the measure or measures were agreed legislation. In addition to this, the Union has dictated all appointments of men administering the laws, and has controlled the operations in connection with the coal industry to suit its own sweet will.

Who is to blame for the Johnson City affair? It is as plain as the nose on a man's face. No doubt the Union officials will try and pass the buck and will get away with their bluff, so far as people who are not familiar with affairs at Springfield are concerned—but it is a case of too much Union and is a disgrace.

It is time the Legislature of Illinois stopped passing laws in the interest of this or that group and confined its efforts to the interest of the general public.

Apprenticeship Training

EMPLOYERS are beginning to recognize the value of apprenticeship training. In a recent issue of the *Wisconsin Apprentice,* published by the Industrial Commission of that State, it was said that there were on November 1, 477 employers in the State of Wisconsin employing a total of 1,856 regularly indentured apprentices.

One hundred and forty-four were added to the list of those taking up apprenticeship training in Wisconsin in 1923 up to November 1. In 1922, 161 new employers took up the work, while in 1915 the number was only thirty-three.

One reason why labor costs so much in the building trades is because there has been a restriction in the number of apprentices. Manufacturers are not subject to such restrictions.

Union Labor Capitalists

THE Brotherhood Investment Company, controlled by the Brotherhood of Locomotive Engineers, has completed the sale of its $10,000,000 capital stock. This capital consists of 7 per cent preferred stock for each $200, of which $100 of common stock of no par value was given free. About 90 per cent of the capital was subscribed by Union members, the greater part coming from railroad workers.

Every time a labor union engages in the banking business or other financial enterprise, it enables its members to understand more clearly the problems and handicaps of capital. They are not so likely to kick over the apple cart. One reason why communism will find it difficult to obtain a footing in the United States is because the workers are so prosperous. Most of them would have everything to lose and nothing to gain by a Soviet Republic, such as flourishes in Russia.

Charles M. Schwab, Optimist

CHARLES M. SCHWAB, in an interview in Paris a few days ago, said everybody in America is an optimist. We believe he is right. Everybody has reason to be encouraged over the outlook. It does not cost anything to be cheerful. Most of Mr. Schwab's success in life—and he has been very successful—has been due to his smiling outlook.

Mellon Plan Means Real Tax Relief

Earners of Moderate Incomes Receive Chief Benefit; Public Generally Approves of U. S. Government Stand

UDGE ZOLLER addressed the recent National Farmer-Manufacturer Convention, held at the Congress Hotel, Chicago, der the auspices of the Illinois Manucturers' Association, on "The Country's xes." The following article is the first lf of his address. The second and final stallment will be published in the next sue of MANUFACTURERS NEWS.—ditor's Note.

By J. FRANK ZOLLER

Tax Attorney, General Electric Co., Schenectady, N. Y.

I.

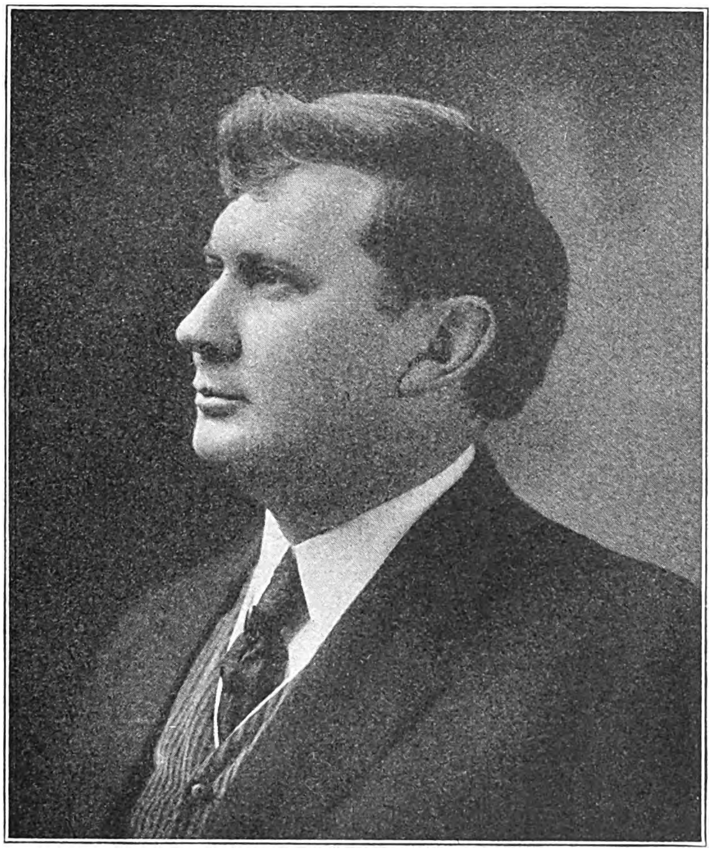
AS a general proposition taxes add to the cost of living. An increase in the country's taxes invariably means an increase in the cost of living. The corllary of this proposition is that reduction in the country's taxes ecreases the cost of living. Beause of these facts it is difficult o imagine in any civilized comunity anything more unpopular an an increase in taxation or nything more popular than tax eduction. There are always any opportunities to increase e country's taxes and few oportunities to decrease them. In very state in the Union taxes ave steadily increased for the ast number of years, and the urden of taxation in every state as become greater year by year.

The total tax bill of the nation ncreased from about $1,382,000 n 1903 to $2,194,000 in 1913 nd to $7,061,000,000 in 1922. n 1921 the nation's taxes had eached the amount of $8,363,-00,000. There was a reduction in ederal taxes in 1922, but state nd local taxes have continued to ncrease year by year. Notwithtanding the deduction in Federal axation in 1922, the ratio of ll taxes to national income was till one-eighth, the same as in 1919. This was due to the fact hat while Federal taxes had been educed, state and local taxation ncreased as compared with the ation's income sufficiently to offset the ederal reduction.

On the basis of total taxes in this country o local income, each individual was reuired to contribute 6¼ weeks' income n 1922, for support of all government ctivities in this country, as against 3⅓ veeks' income in 1913. This means that he price paid by the average individual in his country for being a law-abiding citizen as doubled since 1913, while taxes in pracically all the different states still continue o increase. It is obvious that any individual would welcome an opportunity whereby, through a reduction in taxes, he might be permitted to work less for the Government and more for himself.

There is not much immediate hope of getting taxes reduced in the different states. As a matter of fact, there is every indication that state and local taxation will tend toward an increase instead of decrease.

There is, however, at this time an opportunity to reduce the Federal tax burden, which reduction will tend to also decrease local taxes. The country has been advised by the Honorable Secretary of the United States Treasury that if the present economical policies are followed by the Government, the Federal burden can be reduced about $300,000,000. There is thus afforded an opportunity to reduce the 6¼ weeks, which individuals on the average are required to work for the purpose of maintaining the various governments of this country.



J. Frank Zoller

There probably is not an intelligent individual anywhere who is not interested in this reducton of his country's burden and who does not rejoice that there is now an opportunity to permit him to spend less time working for the Government without direct remuneration and more time working for himself with direct remuneration.

Tax Cut All Important

As to how this reduction can best be brought about, there is and always will be differences of opinion. No tax law was ever enacted or the burdess thereunder decreased to the entire satisfaction of every individual affected. However, it would seem that all would agree that a most important thing in tax reduction is to get the tax reduced. As all people are affected by practically every tax ever imposed by any government, it necessarily follows that all people are benefited when any tax is reduced.

The present Federal taxes are a result of the war. There never was a war fought which did not result in additional tax burdens upon the people of the countries involved. It, therefore, follows that the greater the number of wars fought by any country the greater are the tax burdens imposed upon the people.

It is of the utmost importance to relieve the people of any country from war burdens on as early a date as practicable. As compared with the people of every other country involved in the World War, the people of this country are most fortunate because, we are advised by our chief fiscal officer, that the condition of the finances of this country permits a material reduction in our Federal taxes.

Taxation is a complicated subject. No equitable tax law was ever enacted which did not result from profound study of the subject prior to the enactment of the law. Before any tax measure can be enacted a concrete proposition has to be submitted by Congress. Before any tax can be equitably reduced a like study has to be made and a concrete proposition for the reduction of the tax submitted by Congress. In enacting a tax law it is important to determine what sources in the first instance should be called upon bear the burden; and when that burden is reduced it is always important to determine what sources shall be directly relieved in order to bring about the greatest good to the greatest number. The Honorable Secretary of the Treasury has not only suggested the amount of reduction in the Federal burden which should now take place, but has submitted a comprehensive plan of tax reduction with the view of securing the greatest possible benefits to all the people.

Every taxpayer in this country, whether he contributes directly or indirectly to the tax burden, should carefully study the features of that plan and unless he has a better plan to substitute therefor which is likely to succeed, should give it his unqualified support because, as before stated, the important thing in tax reduction is to get the tax reduced.

The tax reduction plan, which the Ways and Means Committee is now considering, is generally known throughout the United States as the "Mellon Plan" because it was advocated, after careful consideration by Treasury experts, by the Secretary of the Treasury himself. The plan is not only comprehensive but even a superficial examination of it must convince any fair-minded individual that it is intended to accomplish the greatest good to the greatest number to the extent that tax reduction is possible under existing fiscal conditions of the Federal Government.

Reductions Under Mellon Plan

In the first place, the Plan suggests material reductions in the taxes paid by individuals with small or moderate incomes. For example: Single persons with earned incomes ranging from $1,200 to $3,200 now pay taxes from $8 to $88 per annum; under the Mellon Plan, these same individuals will pay taxes ranging from $4.50 to $49.50. Again, under the present law, married persons without dependents whose earned incomes range from $2,600 to $6,000, are now taxed from $4 to $160; whereas, under the Mellon Plan, these same individuals would pay taxes ranging from $2.25 to $90. A married individual without dependents, whose annual net earned income is $6,000, under the Mellon Plan pays a tax of $90 as against $160 under the present law, or a saving of 45 per cent. Forty-five per cent is about the saving affected upon all income taxes up to $6,000. The single individual having an earned income of $3,000 now pays a tax of $80, whereas under the Mellon Plan the tax is reduced to $45, effecting a saving of $35 or substantially 45 per cent of $80.

No law, which reduces the tax 45 per cent upon earned incomes ranging from $1,200 to $6,000, can be said not to take into consideration a reduction of incomes of individuals of small means. This saving on small incomes is not effected alone by a reduction in income tax rates, but by classifying earned and unearned incomes and subjecting earned incomes to a tax rate which is substantially 25 per cent less than the rate imposed upon unearned incomes.

It is a fundamental principle of economics that a differentiation should be made in the taxing of earned incomes as compared with unearned incomes. Earned income results from the personal effort and work of the taxpayer and represents income from wages, salaries, fees and other efforts performed by a person in his individual capacity. Unearned income, on the other hand, represents income derived from securities or return on capital invested. In the one case the individual must perform the work himself or, in other words, must employ himself, while in the other case the capital is made to do the work and IT is employed instead of the individual. The chief difference between earned income and unearned income is that the earned income ceases to exist after the individual ceases to work. Unearned income continues to flow regardless of the amount of work performed by the individual receiving the income and, as a matter of fact, unearned income even continues to flow to the beneficiaries of the individual after the individual is dead.

An individual dependent solely upon earned income must set aside a portion of the income to be invested if he is ever to be put in the same position as the recipient of unearned income. A reduction in the tax on earned income merely puts the recipient in a better position to save so that he may eventually enjoy an unearned income and may sometime be put on equal footing with the taxpayer who now receives unearned income.

There is no sound argument against the proposed reduction of the tax on earned incomes, as compared with the tax on unearned incomes. This sound position of the Honorable Secretary of the Treasury has been generally conceded throughout the country, and is one of the ways whereby the Honorable Secretary proposes to lift the burden of those taxpayers of moderate means.

The other reduction proposed by the Honorable Secretary of the United States Treasury is in respect to those individuals now subject to the highest surtax rates. Under the present law, individuals whose incomes exceed $200,000 per annum are subject to taxation upon that part of their incomes in excess of $200,000 at a surtax rate of 50 per cent and an income tax rate of 58 per cent in all. If these incomes result from dividends received from corporations, the miximum rate is a surtax of 50 per cent and a normal tax, paid by the corporation prior to declaration of the dividend, amounting to 12½ per cent making the total tax in such cases amount to 62½ per cent.

(The second and final installment of this article by Mr. Zoller will be published in the next issue of MANUFACTURERS NEWS.)

Mid-West Fliers at Monmouth, Ill., Has Enviable Record—No Accidents

MR. I. F. DAINS of the Western Stoneware Company, and also President of the Mid-West Airways Corporation of Monmouth, Ill., and Chairman of the Aircraft Production Committee of the Illinois Manufacturers' Association, sends the following data of the flights made by John Livingston of his Company:

Plane	Time in air. (Hours)	Miles	Passenger Landings.	Student Landings	Passengers Carried
J. N. 4D.	98.34	6015	95	378	85
Breguet	90.35	7300	195	...	451
Standard	10.00	600	25	3	25
Totals	199.09	13,915	315	381	561

"The above record is clean cut and an enviable one, because during all this time and all this flying activity there did not occur an accident of any kind, not even a forced landing," commented Mr. Dains.

Flights have been made to the beach at Oquawaka on the Mississippi River, to Springfield, Ottawa, Kankakee, Macomb, Galesburg, Peoria, Rock Island and Moline in Illinois; Terre Haute, Ind.; St. Louis, Mo.; Davenport, Des Moines, Fairfield and Iowa City, Iowa, and numerous other towns of less importance.

This information is given for the purpose of indicating what can be done in a community where there are aircraft enthusiasts, such as at Monmouth. The Aircraft Production Committee of the Illinois Manufacturers' Association is trying to stimulate interest in aeronautics. A survey made by the Committee shows that there are several thousand Illinois manufacturers and dealers who can supply material for aircraft, and the United States expects to spend $10,000,000 a year in an aircraft construction program during the next ten years.

According to the last United States manufacturers' census, conducted by the Government, there were twenty-one establishments engaged in the manufacture of aeroplanes, seaplanes and parts in this country in 1921, with 1,395 wage earners earning $2,202,307, and with a value of products amounting to $6,641,988. The value of the products was a little less than half of what it was in 1919 but this should not be discouraging as there was a big slump in the industrial output of many other manufacturers, including agricultural implements.

The Mid-West Airways Corporation at Monmouth is doing a good deal to put aviation upon a commercial basis and this will be the best hope for the future prosperity of the industry.

actors Affecting "Plant Location"

Many Problems of Site Selection Viewed from Broad Standpoint—Proper Choice Will Conserve Investment

HIS article, for which MANUFAC- TURERS NEWS is indebted to A. J. emis, manager of the Chicago office of ay & Zimmermann, Inc., is a resume of cent contributions on the general sub- ct of "Plant Location" presented by Mr. oore before a number of prominent en- ineering societies. The second and final stallment of this article will appear in e next issue of MANUFACTURERS EWS.—Editor's Note.

By HAROLD T. MOORE
Industrial Engineer With
Day & Zimmermann, Inc.

I.

THE phenomenal growth of the United States in commerce and industry during the last half century has introduced many new and recurring problems n production and distribution. The ex- ansion of industry in keeping with our national development, the rapid consumption of natural resources and the high cost of labor and materials in recent years, have revised many former views on production economics, compelled closer attention to cost details and encouraged greater efforts in the endeavor to eliminate avoidable waste. The former days of relatively cheap raw materials, fuel, labor and transportation, of easy markets and wide margins, no longer exist and the post-war deflation period has ushered in an era of enforced price cutting and keen competition.

In order that profits instead of losses may be maintained during the uncertain period of declining price, it is, therefore, necessary that advantage be taken of every opportunity to conserve labor, materials and expenditures. It is reasonable to expect that with the cost of living still 61 per cent higher than in 1913, and immigration restricted to conservative limits, that wages will remain high for some time to come. Through the use of labor-saving machinery, mechanical handling equipment, improved manufacturing and distribution methods, etc., marvelous results have been achieved in increasing the productive capacity of the individual; but from the standpoint of economical distribution and future business prospects, it is of equal importance that the economic features of the plant and its product should be reviewed with an unbiased consideration of physical handicaps and location disadvantages.

Adaptability to Site
DAY & ZIMMERMANN, INC.
ENGINEERS
NEW YORK PHILA. CHICAGO

With new developments in production facilities, changed trade conditions, building or property restrictions, burdensome taxation, unfavorable labor market, etc., the relocating of a business often becomes necessary and affords an exceptional opportunity of eliminating past mistakes and handicaps and of planning with judgment and foresight. The advantages to be gained from a strategic location, favorable site and efficient plant layout are important factors in economical production and distribution, and assist in conserving the invested capital, as future extensions can be added as needed in accordance with an established layout and predetermined program.

The leading factors to be considered when a new or an old industry is seeking a new location are presented in the following discussion, the problem of site selection being viewed from the broad standpoint of its relation to raw materials at the source and finished products delivered to the consumer.

RAW MATERIALS — Raw materials have a relative value which varies with the cost of obtaining, improving or classifying them at the source, plus the charge for delivering them to the customer. When extracted from the ground or the forest, the materials are at the bottom of the value scale and increase in worth as human and mechanical energy are applied in the refining and transportation process. Extractive industries, such as mining, logging, agriculture and fishing, are necessarily conducted at or near the source. Whenever the partial refining of raw material reduces the weight or bulk enough to make a considerable saving in freight charges the logical place for that particular industry is at or near the source. Lumber and pulp mills are typical examples.

Pittsburgh became the foremost iron and steel district on account of its proximity to soft coal mines, natural gas fields, Connellsville coke and limestone quarries, as well as its strategic location as a distribution center. It has long maintained its lead in spite of the fact that iron ore had to be hauled by rail from the Mesabi mines in Minnesota to Duluth, by ore boat through Lakes Superior, Huron and Erie and by rail to Pittsburgh. Marvelous handling machinery was devised to expedite the loading and unloading of vessels, it being necessary to stock in advance surplus quantities of ore at the Lake Erie docks and at the blast furnaces for use during the winter when navigation on the Great Lakes is closed.

With the industrial development of the Middle West and increasing demand for steel in central territory, the newer steel plants are being located along the South shore of Lake Michigan, the West end of Lake Superior, near St. Louis and at other Midwest points, which developments are in response to economic need and show the Westward trend of steel production. Eventually Pittsburgh may lose its supremacy as the leading center of the steel industry, but its lead is too well established to be quickly overcome. The annual steel producing capacity of the United States aggregates 54,000,000 tons, of which nearly 25 per cent is still located in the Pittsburgh district. The cheap fuel obtained from by-product coke-ovens, rail facilities for the quick transfer of hot metal from eighty-six blast furnaces to nearby open hearth furnaces for conversion into ingots, the enormous rolling capacity in the district, its geographic location, etc., have been important factors in enabling the "Steel City" to retain its reputation as the leading "tonnage producer."

In the cement industry, plants are located near the cement rock quarries, but possess additional advantages if they are not too far from coal mines or leading distribution centers. The cost of power is an important factor, but with the more general use of waste heat boilers in the larger plants and the relatively low cost of purchased power to the larger consumers, power costs have been greatly reduced since the early days of the cement industry. Eastern Pennsylvania still leads in the number of barrels of cement produced, but the majority of new plants are being built in the South.

FINISHED PRODUCTS — The higher freight rates on certain classes of finished products than on the raw materials from which they are produced, will frequently justify the industry being located near a leading center of distribution; or, if the

What Gasoline should *You Use*?

FOLLOW the practice of buying your gasoline on the sound basis of service rendered to you. Find out which brand of gasoline carries your automobiles and trucks the most miles on a gallon. You can do so easily by keeping an accurate record for a week of the mileage secured from three or four different brands of gasoline. This test will show you at the end of a month which gasoline is best for *your* work.

From the experience of large fleet owners, most of whom keep an accurate record of their hauling costs, it has been proved that

RED CROWN
GASOLINE

gives more miles per gallon. If it gives you only one mile over and above what you are now getting, it will reduce your gasoline costs from 6% to 25%.

Because RED CROWN is made for the one purpose of producing *Power* in the modern internal combustion engine, it is the most efficient gasoline you can use. In addition to increased mileage, Red Crown gives you a quick start and an easy pick-up. It is always uniform in quality, so you obtain the same engine performance no matter where you buy it.

Include RED CROWN in your gasoline test and from then on you will use it exclusively.

Do You Know the Six Essentials of Good Gasoline?

If one of them is lacking in the gasoline you use, you are not getting value received for your money.

RED CROWN GASOLINE

You can easily find out what they are by reading the booklet "What Is Good Gasoline?" Write us for a free copy.

“Art in Industry” an Aid to Business

Artistic European and Oriental Goods Find Little Competition in U. S.—Industrial School in Chicago

NDUSTRIAL art is a subject comparatively new to industry. However, it is gradually making itself felt, and manufacturers are coming to realize that they have not paid enough attention to it in this country. In some respects European manufacturers are many years ahead of manufacturers in the United States. To meet this situation there was organized some time ago the Association of Arts and Industries, with headquarters in Chicago, and this Association is aiding in the establishment of an Industrial Art School in connection with the Art Institute of Chicago.

Mr. Watson was one of the speakers before the Illinois Manufacturers' Association at its recent annual banquet. He is Director of the Art Institute of Milwaukee, and a lecturer in the Extension Department of the Art Institute of Chicago. He has a reputation throughout the United States as one of the best posted men on industrial art and its possibilities in making products an inspiration to their makers and to consumers.

The following article is an abstract of his address.—Editor's Note.

By DUDLEY CRAFTS WATSON
Director, Art Institute, Milwaukee;
Lecturer, Extension Department,
Art Institute of Chicago

Dudley Crafts Watson

THE place that art occupies in American life has, for the first decade, become a vital thing. We have had art. We had a magnificent heritage of art that came with the exquisite tastes enjoyed and manifested by the Pilgrims who settled this country. The national, I should say the racial, background of this part of North America contains a culture and a sense of esthetics that few races in the entire world can boast of. That has been almost obliterated, and modern progress has eliminated in every vital phase that heritage that our ancestors brought with them from Europe.

However, at this moment, art takes its place with the great activities of American life, and we hope that some time, some day, the trinity of endeavor pictured so eloquently by Sophocles may result, if not by ourselves, by our children.

Sophocles places esthetics equally with intellectual and physical endeavor; and it was only since the Athenian supremacy that esthetics had anything like a third measure of importance. Today it has a very meager measure of importance. But we are awake to the situation that never in history have the individuals of a nation been so free to reach out and accept esthetics and to make it a part of the enjoyment, or at least the recreation, of daily life as at least a hundred million inhabitants of this nation now have.

The progress of machinery, of science, through the great machinery of mass production, of labor-saving devices, has given every individual in this land an emancipation that kings and princes a few generations ago could scarcely boast of.

The parents of the people seated in this room had to depend upon their personal daily toil for much of the food and the clothing they possessed. Americans do not grind flour by hand, make shoes at home, weave dress goods. Those things are done by the magic of machinery. And yet, even today, with this great product we are constantly looking toward the European market for things to make daily life in the American home more delightful, enjoyable and satisfactory.

Americans, for the first time in history, can, as a great nation, look toward a few hours of every day to gain some measure of culture, to pursue some line of happiness, that was denied their immediate ancestors. There is not a man, woman or child in America today but who can look forward to some few moments or hours of fun before they have to go to bed at night. In almost every home the problem today—and it is equally true in the rural districts as in the cities—is: How are we going to spend our leisure hours?

Through the teaching of esthetics by the great periodicals, through the literature that is distributed by the rural mail delivery, through the contact we have with the entire audible world by present-day radio, through the mastery of music in the phonograph, we are gaining, as if by magic, a cultural sense; and with the systematic teaching of esthetics in public school education we are sure that our children, in a few more years, will have developed some tastes.

Americans Lack Taste

Americans at the present moment cannot boast of a great deal of taste. The most delightful things procurable in the last Christmas market were articles that came from Germany or Austria or Japan or Scandinavia or some other industrial center, where beauty was added to everything produced.

If we desire today to build our houses, to manifest taste, do we build American houses? We will say, “Now, we cannot have it Colonial, because Colonial, after all, takes too much fuel. We must lower the ceilings. We do not like the tall pillars in front of the house because they do not give us either a porch or the proper shade, and they cut off the light too much from the rooms.” So we either make a great big porch or eliminate the porch entirely and resort to the English house or the Italian Renaissance house.

We go to the great Southwest and try to develop something that will express California Mission. We have a great struggle in our evolution of architecture to develop something that is strictly and typically ours. We have not learned in the progress of science how to use the great materials that science gave to us.

American furniture has gone through a stage almost more dramatic or tragic than American home building or American domestic architecture.

Furniture began with Colonial. Eventually we absorbed the spirit of mid-Victorian and we took it so hard that presently we did not have a couch with a straight leg or chair that did not have a dozen knobs, and our mouldings all had fluting around them.

In a little while we had overdone Victorian, just as we have overdone nearly everything. Some furniture manufacturer, visiting the great and newly opened Southwest, came back to Grand Rapids or some place else with a new idea. He had seen straight line furniture that had no gewgaws or curved lines in it and immediately produced Mission furniture. Heavy, strong, powerful. That is the trouble with it. It has lasted forever. It never wears out.

But it, too, gradually has gone out of favor, because some American manufacturers or inventors, discovered a way to produce period furniture on peculiar lathes, and we could buy a Queen Ann bedroom set or dining-room set from the Jacobean period or an Adam drawing-room that could be turned out by these furniture manufacturers as if by magic, and have these things for a moderate price, and presently have a house with a curious arrangement of museum rooms. Nothing particularly American in them.

We build the most magnificent and glorious temples ever erected, that reach sixty stories into the sky. We have to borrow the elements from eleventh century Gothic, or from 400 B. C., Classical. We have not discovered a way to express ourselves in this great new material, or through the new power of science. In the things we have personally we are guilty of applying, almost without any reason, designs that belong to materials of an entirely different nature.

Colors and Music Developed

In cotton prints, in silk weaves, in the fabrics that come to us today through our highly developed industries, we have color that is simply superb. Our advance in color has been comparable to our advance in music. But in none of the other arts have we advanced in like measure. The color of a fabric, the wonderful weave of it, delights us, until we begin to examine its texture.

Nearly every man in this room has a wife or a daughter who a year ago felt fashionably gowned only when she wore a so-called Paisley or King Tut gown, with a lot of King Tuts running around her back, with Chinese pigs, or something of that sort, running around her person, things which do not belong to her personal adornment at all.

We have at times been guilty of trying to convert the thing that we have to use in daily life into something of a totally different nature. You remember the sideboards that turned themselves into folding beds. Why a folding bed should ever look like a sideboard in the daytime is beyond me.

In the matter of music boxes, who yet has designed a phonograph container that expresses music?

We have been satisfied with the upright piano for a good many decades. The upright piano, an American invention in the first place, never has expressed music. What is it that makes the grand piano so much more desirable and satisfying? It is the fact that it expresses by its design the various lengths of the strings that create that music.

I cannot imagine any nation but America producing such an article of daily use, of individual use, as our rural mail boxes, that could possibly be so ordinary, so utterly expressionless, so absolutely blah, when it comes to any manifestation of taste. Why, if anyone could go out today and design a thoroughly practicable rural mail box that would be beautiful, he could make a million dollars. I cannot design it. The boys and girls who come from our art schools cannot design it. There is not the comprehension nationally for the thing.

The reason we take the vanity boxes from Germany, the cigarette cases from Japan, the jewelry from France, that have flooded our markets within the last few months, is because those things express the taste not only of their designers but of the whole nations that produced them. They express the taste of a great people and show the development of that taste.

In our life we have, as a divine heritage, the taste of every nation, but it is latent, it has not been developed. We have developed more wonderful painters of pictures than any nation has produced. We have more musicians on this continent than any nation or any continent can boast of today. Yet all of these things will be meaningless in American life, as an expression of American life, as long as we produce folding chairs similar to the kind that are brought in for weddings and funerals.

Too Much Imitation

In the ordinary commodities of daily life we are either imitating European or Oriental things, or we produce something that has utility as its only aim.

Now, I cannot imagine in our American life that we are going to retain anything like industrial prosperity, that we are going to compete with the freed markets of central Europe, unless we can inject into the things we produce beauty as well as utility, and beauty that will be satisfying and will express us.

Can you not see how slow we have been

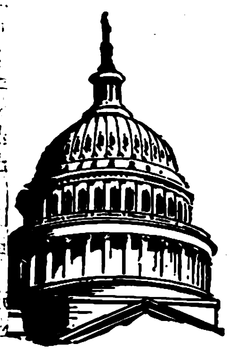
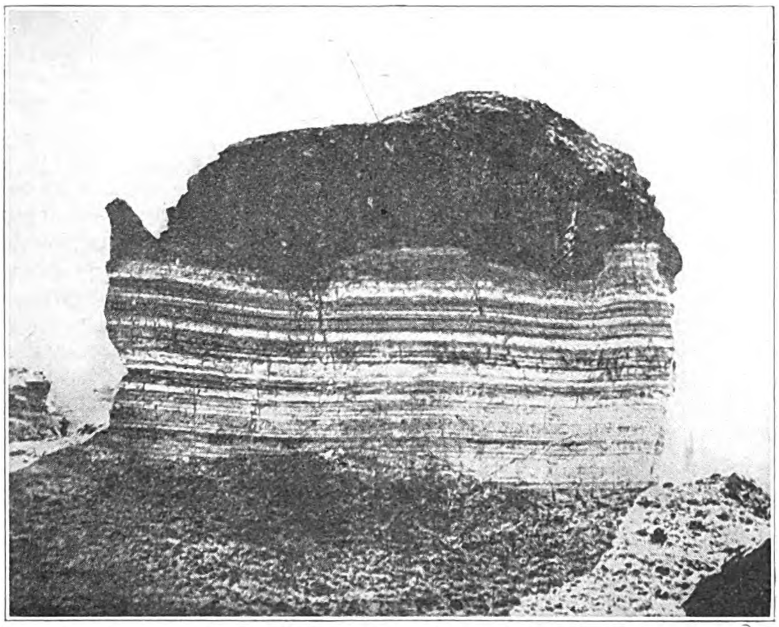
Teapot Dome Scandal Stirs Capitol

President Coolidge Demands Unsavory Mess Must Be Cleaned Up—Deadlock Looms in Tax Reduction Fight

By JOHN M. TOWNSEND
Washington Correspondent,
Manufacturers News



Washington, D. C., Jan. 30—Washington is outraged by the revelations before the Senate Committee which is investigating the lease of the naval reserve oil lands. For the first time nce the administration of Grant, a Cab- et officer has admittedly committed such discretions in office as to shake public onfidence in the integrity of the higher ficials of this Government. While final udgment must be withheld until all the vidence is taken, the investi- ation has proceeded far nough to determine Presi- ent Coolidge, and Republi- ans and Democrats in Con- ress alike, that this unsavory ess must be cleaned up.



Underwood & Underwood

OIL REVELATIONS — resident Coolidge was fore- arned of the testimony of rchie Roosevelt relative to is suspicions of loans made o former Secretary of the nterior Albert B. Fall by he oil interests which secured he leases to exploit the naval il reserves in California nd Wyoming and had a rep- esentative of the Depart- ment of Justice on hand to ear that testimony. While he testimony itself was sen- ational, it was not conclu- ve, but it did serve to put he President on guard and, n view of the subsequent dmissions of E. L. Doheny hat he had loaned Mr. Fall 100,000 five months before e secured his oil leases in California, and f J. L. Zevely, that he loaned Mr. Fall 25,000 of Sinclair money last Summer, hree months after Fall left office and a year fter the Sinclair lease to Teapot Dome as negotiated, it proved a fortuitous cir- umstance for the Administration. As a esult the President has taken a stand for riminal prosecutions of all persons who may be criminally involved, so far as the vidence will permit, for an investigation o discover whether or not there was fraud n the leases themselves and, finally, to determine whether or not it is necessary o abrogate the leases in the event there s not sufficient evidence of corruption or raud to validate the leases. So far as the eases alone are concerned, it can be said now that the Government will part with hem with reluctance, believing them to be very greatly to the Government's advantage as they now stand.

FALL'S PREDICAMENT — Whatever else may result from the investigations of the Senate Committee, the indiscretions of Secretary Fall, coupled with his puerile efforts to evade revealing them, has not only impaired his standing but it has involved the Republican party as a whole in a scandal which will be heard from until after the elections next Fall, at least. In telling the Senate Committee that he had received no money from either Doheny or Sinclair "on any account whatsoever," which statement was not made under oath, and that he did borrow $100,000 from Edward L. McLean of Washington, Mr. Fall, according to his friends here, was moved so to do by his personal belief that the Senate had no right to know of his private affairs and that, in any event, without the consent of Mr. Doheny, which he apparently did not seek, he had no right to discuss the Doheny loan with the Committee. The McLean story followed, with all the outward appearances of a hasty frameup, to lull the Senate Committee into inaction, but the Committee did not lull. Its members immediately began scouting about for traces of the checks which were alleged to have passed from McLean to Fall, and immediately Mr. Fall realized that a storm was in sight. McLean promptly denied the story and, at that juncture, Mr. Doheny volunteered to come to Washington and tell all about the $100,000 loan himself. Mr. Fall is expected to corroborate Doheny's statement in detail and to explain the Sinclair loan of $25,000; but there yet remains to be cleared up the allegation that $68,000 was paid to Senator Fall's foreman, and any other details which may arise out of the forthcoming testimony.

ADMINISTRATION ATTITUDE—President Coolidge, while warning against any prejudgment of individuals or other issues involved in the oil scandal, has also issued definite orders to all executive departments to "come clean" on its ramifications as they affect this Administration. The only connecting link between the Fall leases to Doheny and Sinclair and the Coolidge regime lies through Secretary of the Navy Denby, who had a heavy voice in determining the policy to lease the naval oil reserves and who passed on the contracts which Mr. Fall negotiated. There is, thus far, no evidence whatever that Mr. Doheny participated in the negotiations between Mr. Fall and the oil lessors, and there is evidence that every suggestion made by Mr. Denby for the protection of the Government was incorporated in the contracts. So far as the policy of leasing oil lands is concerned, it can be said now that one of the chief reasons for the decision to open up the naval oil lands was the feeling in high governmental quarters here in 1921 and 1922 that the United States and Japan were drifting into war. While it might have been possible for the Navy to get oil for war purposes outside of the naval reserves, it was not possible for the Navy to get oil storage facilities on the Pacific Coast, Hawaii and in the Philippines without asking Congress for a specific appropriation for that purpose. The oil leases made with Doheny and Sinclair provided for the expenditure of a part of the Government's royalty on such facilities, the building of pipe lines and, in addition, a better royalty than the Government had ever secured before. Within two years the Washington Arms Conference and the Japanese earthquake have definitely removed all danger of war, but the California oil has been demonstrated to be inferior to Wyoming oil for naval purposes and the Teapot Dome field has

Read This--Then Locate Your Factory In Canton, Illinois

Alert business men who are on the lookout for an ideal factory site, read these facts about Canton, Illinois, sponsored by the Canton Community Club, an organization ready and willing to lend every assistance in bringing your factory to this thriving city of 12,000, forty miles south of Galesburg on the main line of the C. B. & Q. and thirty miles west of Peoria on the T. P. & W. railway, connected by electric line, carrying freight and passengers to the M. & St. L., ten miles distant. Shipping facilities, you'll agree, are excellent.

An abundance of water, gas and electricity are available at very low rates. Coal is mined right here at home, furnishing cheap fuel.

Eleven modern, well-equipped school buildings, including fine high and parochial schools. The city library is worthy of special mention. Nearly every church denomination is represented.

Canton has three banks, with combined deposits of nearly $5,000,000.00. Two thriving Building and Loan Associations, with over $1,000,000.00 in assets, which enables the wage-earner to own his home.

Canton is the home of the largest plow works in the country which meets no obstacles,—labor, power or transportation, in carrying on its great industrial operations.

May we tell you more about Canton's consideration for the firm searching a suitable site to build a factory? Splendid inducements await you here. Write for detailed information. Don't decide until acquainted with us.

The neglected 25% in cost analyses . . .

WHEN a plant's time study system shows up payroll leaks, when analysis betrays buying wastes, and production records uncover operating losses, then, and then only, is that plant operating efficiently — in whatever departments or operations these things are applied.

Unfortunately, although about 25% of production cost is often chargeable to power, efficiency methods aren't always applied to steam production.

What the stop watch is to the time study process, Republic steam-measuring instruments are to the steam-making process. Their graphs show steam consumption by machine, process, or department, point out wastes, indicate savings and provide a basis for the formulation of equipment and material purchasing policies.

Where shall we send your copy of "Power Plant Cost Accounting" written on the subject of the hour for cost accountants?

REPUBLIC FLOW METERS CO.

CHICAGO, ILL.

been shown to be three-fourths barren, so that the Government still thinks its leasing contract is easily the best the Government ever made. If fraud or corruption is shown in the making of these contracts there is nothing to do but cancel them. On the contrary, if fraud is not shown, the Government would like to find some satisfactory way to get the benefit of the present leases, for it could not make as good a contract again in view of the physical facts now known.

THE TAX FIGHT—Unless there is a break in partisan ranks in the House, tax reduction legislation is rapidly drifting into a deadlock in that body. For the purpose of developing the Democratic strategy on tax legislation, Chairman Green of the House Committee on Ways and Means, this week asked the Democrats whether or not they were definitely committed to the Democratic plan of tax reduction as represented by the Garner Bill. That question has not yet been definitely answered, but the tax debate broke out on the floor of the House in such a partisan way as to rend apart rather than bind together prospects of a non-partisan agreement on a tax bill. Mr. Green was trying to find out whether the Democrats intend to caucus and make the Garner Bill a Democratic party measure, in which event the Republicans on the Ways and Means Committee intend to counter by supporting the Mellon Bill substantially as written in the Treasury Department. The result of this maneuver would be to throw the Tax Bill on the floor of the House without sufficient support to pass the Mellon Plan unamended and, probably, without enough votes to pass the Garner Plan unless the LaFollette group in the House should join them. President Coolidge is standing pat for just such a fight. He wants the Mellon Plan reported to the House and fought out to a finish, whether victory or defeat is in sight. The same fight would be made in the Senate and before the Conference Committee and then, if the bill which finally emerged did not measure up to the fundamentals of the Mellon Plan, the President has inferentially indicated that he would veto it and carry the tax fight to the country. On that issue he is intent on holding the Democrats responsible for the failure of the Mellon Plan to pass, whereas the Democrats assert that if Congress passes any kind of a tax reduction bill the President would not dare to veto it. For the moment it is not possible to predict what the outcome of the present deadlock will be, but all hope of compromise has not yet been abandoned by the Republican leaders of the House, although President Coolidge does not favor such a course of action.

BONUS LEGISLATION—Pressure for bonus legislation by this Congress is gradually dying out, which explains the recent lack of agitation on that subject in Congress. This is not to say, however, that bonus legislation is dead, because it is not. There is still a large majority of the House ready to vote for a Bonus Bill if it is ever presented for passage, but it is also true that there are a larger number of members of the House who are not breaking their backs to force this legislation to the fore at this time. When the tax fight is fairly well removed from consideration by the Ways and Means Committee, a removal of pressure for bonus legislation may be expected and, under the new rules of the House, it will be an easy matter to precipitate that issue again.

Illinois Industrial Council Approves Mellon Tax Plan

Approval of the Mellon Tax Revision Plan as the most important measure that can be adopted at this time in the interest of all the people was expressed in a resolution adopted recently by the Illinois Industrial Council, meeting in the offices of the Illinois Manufacturers' Association. It was as follows:—

"*Resolved*, that the Industrial Council of Illinois, composed of secretaries of manufacturers' associations in industrial centers of the State, heartily approves the Mellon Tax Revision Plan as the most constructive and most essential measure which can be adopted at this time by Congress for the benefit of all the people of the United States.

"The reduction of war time taxes will have a powerful incentive in stimulating business by releasing capital which now is being shifted to tax-exempt securities. The proposed plan will afford great relief to millions of wage earners. It will encourage thrift and economy, not only in the Federal Government, but furnish a much needed example for the curtailment of extravagance in state, county, municipal and other local governing bodies. It is the soundest, most rational and fairest of all the tax reduction proposals now before Congress. Be it further

"*Resolved*, that a copy of this resolution be sent to the President, all Illinois Congressional representatives and to Secretary Mellon."

The resolution was signed by H. A. Jansen of Moline, Secretary of the Tri-City Manufacturers' Association, as President, and John M. Glenn, Secretary of the Illinois Manufacturers' Association, as Secretary of the Council.

Milwaukee A. of C. Nominations

The annual meeting of the Milwaukee Association of Commerce will be held on Feb. 5. The speaker will be Hon. Marvin B. Rosenberry, Justice of the Supreme Court of Wisconsin. Nominations for officers and directors to be voted on at that meeting are:

President—Emanuel L. Philipp.

First Vice-President—Herman Fehr.

Second Vice-President—Fred W. Rogers.

Treasurer—J. U. Lademan.

Directors (3 years)—Fred Schroeder, P. A. McBride, John Eldred, Jr., Irving Gilpatrick, William F. Eichfeld and Burt Williams.

‘True Costs” Essential to Success

Management Must Have Accurate Financial Statements to Direct Business Intelligently—Accounting Important

By **WARREN H. SAPP**

In Charge of Plant Accounting,
Armour & Company

MR. SAPP recently addressed the Southern Division of the Illinois Manufacturers' Costs Association in St. Louis on "The Necessity of True Costs for Successful Management." The following article is the first half of his address. The final installment will appear in the next issue of MANUFACTURERS NEWS.

I.

I OFTEN wonder just when and where the first business instincts crop out in an individual and I am inclined to believe one must hark back to e juvenile days between the marble season d the top season when, I dare say, each d every one of us at some season flour- hed for a time keeping a stand on the old t, bartering in pennies and pins. Even en some were merchants or business man- ers while others, because of some ob- acle, were forced to be the workers. And it is today—just a few stand-keepers and multitude of laborers.

In those days little did we realize the ecessity of true costs or recognize over- ead, but we instinctively knew we must ll the articles for more than we paid for em.

Business defined is really the usage of ollars. That usage in a manufacturing usiness consists of converting raw mate- als, plus dollars, spent for operating ex- enes, etc., into finished goods suitable to e tastes and demands of the consuming ublic. That is the aim of business—with e turnover of each dollar invested to alize, on its return and subsequent jour- ey, a few cents excess, which is commonly rmed net profit.

If there were only one manufacturer for ach line of goods, it would be an easy atter indeed, as prices would be wholly ithin control. Then all that would be ecessary would be to know the true costs f each article without regard to efficiency om a buying, operating or selling stand- oint; but the trouble is, there is more an one factory manufacturing the same ne, which makes it a competitive one, and is, therefore, necessary to manage the usiness efficiently in every division of the orporation.

In a competitive business the sale price practically fixed or controlled by the most fficiently operated factory. That is par- icularly true if this factory is the biggest roducer of the line, and if its costs are redicated on the basis of a fair return of he capital invested. Since selling prices re rather balanced and in favor of the iggest producer of the line, other manu- acturers from an individual standpoint nust necessarily, so long as their sales rices are virtually fixed, stay within the imits of costs and yields of the chief com- etitor.

Of course, if the business, or rather the oncern that sets the pace, does not keep breast with the times; if it does not take dvantage of developments from the standpoint of machinery and equipment, the elling prices of the commodity manufactured by that company will be so high (because of its inadequate methods and inefficiency) that an apparent wide margin of profit will exist. The apparentness of that margin is not real, but it is a mirage that might attract many smaller units of business throughout the country which will market so great a quantity of the line that the standing and stability of the big firm will soon become impaired. Eventually such a firm would face ruin unless changes are made so that costs may be reduced and a higher standard of efficiency realized.

So, no matter from which angle the subject is approached, there is no escaping the fact that business management must at all times have before it true statements of cost as well as true statements that reveal the financial status of the business.

It is not so easy these days to borrow money with which to operate business. The banker does not hesitate to demand a statement showing just how your business stands. He wants to know the ratio of assets to liabilities, the bonded indebtedness and investment in brick and mortar, and he may ask you at what capacity your plant is operating so that he can make deductions as to whether your production is carrying too great a load of overhead expense.

I would segregate a business as follows: First on the list is the General Manager. In most businesses he is selected from the sales force, but he must also be familiar with the manufacturing end of the business. Up to the time of his appointment as General Manager, he, as a rule, has not given much of his time or attention to accountting and financial matters. While Sales Manager, the source of funds did not concern him to a great extent. Managerial duties, however, place upon his shoulders the responsibility of providing funds to operate the business. Then he discovers the real value of the accounting unit—the translator of his assets and liabilities. He must look to his accountants for statistics covering turnover, accumulation of stocks, relation of output to capacity, to keep him familiar with the cost of overhead expense at 35, 50 and 75 per cent and full capacity, how much the falling off of volume raises his costs and likewise affects his margin of profit—all factors that are of vital importance and essential to effective management.

Must Know True Costs

Naturally, to direct the business intelligently, he must know his true costs on all commodities offered for sale.

Operating directly under his supervision is the Purchasing Department; the next division is the Factory Superintendent, or man in charge of operations, next the Comptroller in charge of funds and accounting; the General Sales Manager and the Credit organization.

The funds provided to build or purchase the factory and operate the business are placed in the custody of the Comptroller subject to disbursement by the Purchasing Department whose function is, of course, to buy as intelligently as possible, which is a very important matter. Overbought materials preclude any possible chance of profitable operation irrespective of the endeavors of the Operating and Selling divisions. With a delivery of materials to the factory additional expenditures are incurred for wages, fuel, etc., and the investment in its entirety passes into the hands, so to speak, of the Operating Superintendent, where it goes through various stages of processing, and finally the current funds are represented in the Shipping Room in the form of finished articles ready for disposition on the part of the Sales organization.

The accounting unit records the expenditures as made by the Purchasing and Operating Departments and, by a method of costs accounting, presents the costs of the various commodities. They, in other words, say to the management:

"All current funds you entrusted to our care are now in the form of goods in process and in finished state at a cost of so much per unit, and the Selling organization must distribute on this basis, plus other selling expenses, and a figure representative of profit."

One can readily see, therefore, that the Accounting organization is the link between management, operating and sales, and in order for the business to carry on successfully, its deductions must be true and accurate.

While the costs as presented may be representative of conditions as they actually exist in the factory, it is necessary, in order to know whether the various departments have operated on an efficient basis, to main-

(Continued on page 24)

TRANSPORTATION

"Drive-Aways" by Automobile Manufacturers Cost the Railroads Over $226,000 in Freight Revenue in 1923

RAILROADS entering the automobile manufacturing district of the Middle West, centering at Toledo, O., suffered a loss in freight revenue of not less than $226,000 last year due to enforced idleness of freight cars waiting for automobiles that were driven, instead of shipped, to their destination, according to the American Railway Association. Losses from this source in 1924 will be considerably lessened, it is stated, as a regional conference has arranged for diverting many of the freight cars formerly assigned to automobile deliveries to other uses.

Automobile manufacturers increased their "drive-aways" from 40 to 60 per cent in 1923, it is stated. Through the regional conference it is expected this loss will be overcome. E. W. Edwards of Toledo, is head of the conference, which is composed of bankers, manufacturers and shippers of all kinds in the territory between Buffalo and Chicago and from Northern Michigan to Ohio. This conference will ascertain in advance the number of freight cars required, and will supply only actual needs in the future.

Last year, according to the American Railway Association, 5,000 automobile freight cars were gathered at Toledo as the railway outlet, but many of them remained idle. By diverting these cars to the transportation of food and food materials to other sections of the country, it is expected the cost of living in these areas will be materially affected, to the extent of lowering prices.

Locomotives Shipped Last Year

Shipments of railroad locomotives from the principal manufacturing plants of the country, based on reports to the Department of Commerce for 1923, shows that for the twelve months there were 3,189 against 1,274 during the same period in 1922. Unfilled orders at the close of 1923 were only 387 against 1,592 on Dec. 31, 1922.

R. R. Securities Should Be Popular

W. H. Finley, President of the Chicago & North Western Railway Company, addressing the fifth annual meeting of the Associated General Contractors of America, said in part:

"The railroads purchase 27 per cent of the total production of soft coal, 48 per cent of the fuel oil, 30 per cent of the iron and steel, 17 per cent of the lumber and 10 per cent of the copper and brass, besides an endless list of manufactured articles from needles to car axles.

"These purchases do much to stimulate industry throughout the entire country.

"The railroads need a restorative of credit which will enable them to secure the necessary capital which must be furnished if they are to keep abreast of an ever expanding commerce.

"Railway credit rests on:

"(a) The tangible assets owned by the Company.

"(b) The prospects for continued activity.

"(c) The probability of reasonable earnings.

"(d) The likelihood of fair treatment.

"By every reasonable test applied to the physical characteristics of the railways of the United States they ought to be among the most secure and popular investments.

"Railway credit can only be made secure by just and generous treatment by the regulating authorities."

I. C. Tour to Mardi Gras

The Illinois Central will have its sixth All-Expense Mardi Gras Tour to New Orleans this year, starting on March 1 and arriving in New Orleans the following day. Returning, the special train will leave New Orleans on the evening of March 5, reaching Chicago again in the early morning of March 7. The Mardi Gras "Ball of Rex" will be on March 4. Passengers on the special will be relieved of all details incident to travel, and the tour will include automobile sight-seeing in New Orleans, steamboat excursion on the Mississippi River, and an automobile sight-seeing trip through the National Military Park at Vicksburg, Miss.

Railroad Mileage in 1923

New railroad mileage constructed during 1923 totaled 427 miles compared with 324 miles the previous year, 475 miles in 1921 and 314 miles in 1920, which was the low point in new mileage built. The highest point in recent years was in 1902 when 6,026 miles were laid.

Panama Canal Traffic for 1923

Traffic through the Panama Canal in the calendar year ending December 31, 1923, exceeded that in any previous year. The number of commercial vessels making the transit during the year was 5,037. Their aggregate net tonnage, Panama Canal measurement, was 24,737,437 tons. They carried 25,160,545 tons of cargo, and paid $22,966,838.19 in tolls. As compared with the year 1922, the traffic in 1923 increased as follows: Number of ships, 68.07 per cent; Panama Canal net tonnage, 90.38 per cent; tons of cargo, 83.51; tolls collected, 82.65 per cent.

5 Autos for Each R. R. Car

A census of railroad rolling stock for all of the steam roads in the United States showed, at the close of 1923, 2,400,000 freight cars, 57,000 passenger cars and 68,000 locomotives of all types. There are therefore more than five automobiles for every freight car, passenger car and locomotive in the United States. Motor trucks alone carry about one-eighth of the tonnage carried by the railroads, while the passenger automobiles transport as many passengers annually as are transported by the railroads of the country.

No Deaths of Passengers During 1923 on 4 Railroads

Four great railroad systems went through 1923 without killing a passenger. The systems with clear records are: Chicago & Eastern Illinois, Chicago, Milwaukee & St. Paul, Chicago & North Western and the Atchison, Topeka & Santa Fe.

The Santa Fe has run one and one-half years without a passenger fatality. During the clear period on this system 16,000,000 passengers have been carried, the average trip per passenger being 152 miles. The passengers carried per mile, total for that period 2,400,000,000.

On the Chicago & North Western the operating record has been clear for two years, not a passenger being killed in that period. During the year just closed the system carried 33,913,566 passengers and the average trip per passenger was 34 miles compared with 31 miles the preceding year.

The Chicago, Milwaukee & St. Paul has operated four years without a passenger fatality and has totaled 3,500,000,000 passenger miles. The average trip per passenger on this system was 193 miles.

The Chicago & Eastern Illinois has operated its trains thirteen years without a fatality involving a passenger, and during that period it has carried approximately 1,550,500 passengers yearly. The average trip per passenger has been 88 miles.

arious Factors Affecting Choice of “Plant Location”

(*Continued from page 8*)

usiness is a national one with some export ade, the economical location may be near he center of demand. It is, therefore, ecessary to compare the annual freight ills on raw materials, fuel and supplies ith the cost of delivering finished goods consuming centers.

A number of locations might appear qually attractive to a concern which expects to do a national business, but when he relative advantages and disadvantages f each locality and site under consideration are tabulated and compared it is not difficult matter to determine the preferable choice or whether a further search hould be made for a more favorable location.

Widely distributed markets, as well as scattered locations for raw materials, have elped to decentralize industries. Plants hat develop progressively in an expanding istrict can frequently check competition rom more remote industries.

TRANSPORTATION—By establishing ssembly stations at important distribution enters and shipping automobile parts in box cars instead of the assembled car, the saving in transportation cost has enabled he manufacturers of low priced automobiles to reduce the selling price of their products and multiply their output many imes—Ford's capacity now exceeding 7,000 and Chevrolet 2,000 cars per day.

Geographic location from the standpoint of receiving and shipping by rail, water and motor truck is of prime importance and should receive careful consideration in the selection of the factory site.

New England originally acquired its start as a leading textile manufacturing center on account of cheap water power, suitable climate, available capital, etc., but when the industrial demand outgrew he limited supply of water power and it became necessary to import coal, the initial advantages were partially outweighed by the transportation disadvantages. The enormous lead acquired and the skilled labor market which had been developed in the meantime, were instrumental, however, in helping New England retain its textile supremacy. As the cotton comes from the South, wool from the West and foreign parts, coal from Pennsylvania and West Virginia and the finished products are needed in all sections of the United States, while the foreign export trade on finished goods is relatively small, it is not surprising that the textile industry has about reached its peak in New England and that the newer cotton mills are being built chiefly in the South.

LABOR—With the independent attitude of labor, the large increase in foreign population in certain sections of New England, legal restrictions as to working schedules and the increased freight rates for rail and water shipments, it was only a question of time when the economic advantages of shorter hauls, cheap electric power, a sufficient nucleus of native born population, which could be developed into skilled workers, etc., would receive the recognition deserved and justify the new textile mills being located nearer the source of supplies.

The growth of the United States in population and industry, and the rapid development of automatic and labor-saving machinery, the modern tendency of labor to migrate, the increase in trade and technical schools, are factors which encourage the establishing of competing industries in different parts of the country and make it increasingly difficult for one section or one concern to retain an exclusive commercial leadership.

During the business boom of 1919-1920, the concentration of automobile manufacture around Detroit and of rubber plants at Akron produced an acute labor shortage and wage inflation, which with the housing and freight car scarcity was economically unsound. A greater diversity of industries broadens the labor market, reduces the local competition for skilled labor during prosperous times, distributes the effect of seasonal fluctuations and diminishes unemployment during dull seasons and industrial depressions.

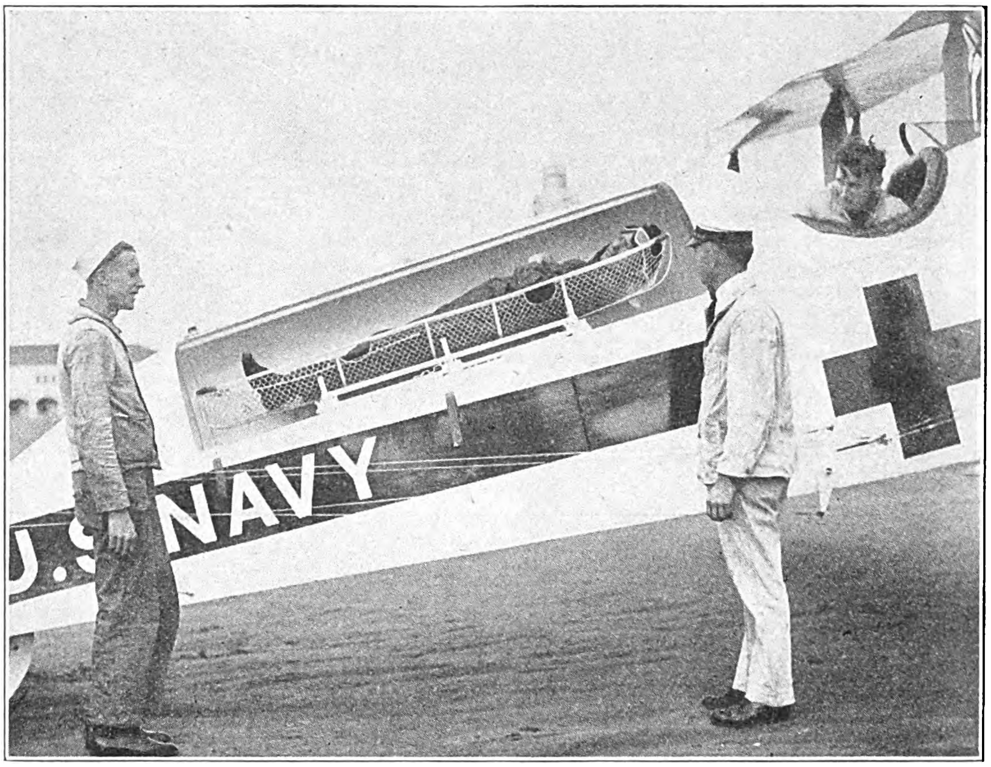
Another factor affecting the stability of labor is the balance between industries employing men and women. Iron and steel towns, railroad centers, the mining and cement districts are typical of localities where women, who desire work, often welcome the opportunity of remaining in their home town. This fact has been taken advantage of by the location of silk, lace, hosiery and other textile mills in numerous towns of Pennsylvania.

(The second and final installment of this article on “Plant Location” will be published in the next issue of MANUFACTURERS NEWS.)

Navy's “Aerial Ambulance” Tests Prove Worth of Ship

An “aerial ambulance” which will transport an injured person to the hospital in a fraction of the time required by automobile ambulances has been built and successfully tested at the United States Naval Air Station on North Island, San Diego, California.

The aerial ambulance is a reconstructed De-Haviland airplane, with a special stretcher compartment replacing the observer's cockpit. All conveniences for comfort are provided. The ambulance can receive a call, fly ten or fifteen miles to the scene of the accident, load the victims, return to the hospital and have the patients on the operating table, all within a few minutes. Many lives that otherwise would be lost are expected to be saved by the rapid transfer made possible by these airplanes. They are expected to be especially valuable to the Government in case of war or accident upon the sea.



U. S. Navy's “Aerial Ambulance” P. & A. Photo

The accompanying picture shows the patient's stretcher in place in the ambulance, ready to start to the hospital. A door closes down, thereby rendering the compartment windproof and warm.

250,000 Immigrants in 6 Months

Immigrants admitted to the United States through Ellis Island in the first six months of the present fiscal year exceeded 250,000, according to Henry H. Curran, Immigration Commissioner. Less than 2 per cent of aliens examined were rejected.

Of the 322,710 aliens seeking admission only 4,438 were excluded and deported, of which number 1,756 were sent back to their native shores solely because they arrived in excess of their quota allotments.

FOREIGN TRADE

"Habit" of Favorable Trade Balance of U. S. Is Seen in 1923 Record of $376,000,000—Over $1,000,000 a Day

THE United States lived up to its "habit" of recording favorable trade balances at the end of the year, according to Department of Commerce reports for our import and export trade in 923. The "favorable balance" for the alendar year totaled $376,000,000, or a ttle better than an average of $1,000,000 day. In December, the excess of exports ver imports ran up to $144,000,000 for hat one month.

"Favorable trade balances" are comparavely recent in the foreign trade of this ountry, for it is only since the development of the producing powers of the great Mississippi Valley through the construction of railroad transportation that we have exported more than we have imported. Prior to 1876 imports usually exceeded exports. In 1876 there were 79,000 miles of railroads against 9,000 in 1850. From 1876 on, "favorable balances" have become characteristic.

In the eighty-six years, from 1789 to the end of 1875, there were only sixteen occasions on which exports equalled or exceeded imports. In the forty-eight years since 1875 there have been but three occasions in which exports failed to exceed imports.

The total excess of exports over imports in the 134 years since 1789 is, in round terms, $30,000,000,000, or an annual average of about $224,000,000.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly.

AUSTRALIA—8976, machinery for manufacturing wire nails.

BAHAMAS—8968, scraps and screened tobacco for cigar manufacturing.

BRAZIL—9001, cigar manufacturing machinery; cigarette manufacturing machinery.

CANADA—8991, Cutlery, all kinds; 8999, fertilizers, fertilizer materials.

CHINA—8936, Lath, metal.

COLOMBIA—8966, plows, road-making machinery, all kinds, tractors.

CZECHOSLOVAKIA—8965, automobiles, not exceeding $1600 in price, automobile accessories.

DANZIG—8952, glue, fish.

EGYPT—8985, automobiles, automobile tires, automobile tubes.

FRANCE—8976, machinery for macerating cordage, rags, etc., for paper stock; 8977, machinery for manufacturing aluminum thimbles; 8975, machine tools.

GERMANY—8993, corn,; 3993, flour; 8989, needles for power sewing machines; 8989, trimmers for boot making machinery; 8993, wheat.

GREECE—8995, cotton goods. hosiery, cotton and woolen: woolen goods, such as flannels, cheviots, serges, and velvets.

ITALY—8933, motors, outboard.

JAPAN—8932. shooks for fish crates.

MEXICO—8935, castor bean hulling machinery; 8980, kegs for nails; 8972, pencil-making machinery.

NETHERLANDS—8996, manganese peroxide; 8990, rectifier for charging storage batteries.

NEW ZEALAND—8988, combs; 8967, engineer's requisites, marine; 8967, hardware, household and general; 8970, parts for storage batteries.

NICARAUGA—8992, billiard tables, pool tables, slot machines.

NOVA SCOTIA—8994, sugar, best quality.

SPAIN—8979, barites washing and grinding machinery and utensils; 8940, electrical apparatus for heating rivets; 8969, taximeters, zinc plate for stereotyping.

New Argentina Law

A law has recently been passed and put into effect in Argentina, South America, greatly increasing the overhead of American companies operating in that country, according to a statement issued by the U. S. Bureau of Foreign and Domestic Commerce, which says:

"Under the terms of this law all employes must pay 5 per cent of their annual salaries or wages into the pension fund; the employes must pay also one full month's wages or salary into this fund in ten monthly installments; of all increases of salary or wages, the first month's increase is to be paid into this fund. Employers of labor or clerical help must also pay into the fund a sum equivalent to 5 per cent of their payroll. Minor exceptions are noted in the text of the law."

Brazil Trade Expert Here

B. H. Noll, Assistant Trade Commissioner of the Bureau of Foreign and Domestic Commerce, stationed at Rio Janiero, Brazil, since December, 1920, has been in Chicago for the past week or more conferring with business men of the Middle West who are interested in foreign trade with Brazil.

Mexican Glass Market

There is no sheet glass manufactured in Mexico in quantities of commercial importance, but there is a good market for it under normal conditions, the State Department reports. The use of plate glass in store windows is very general in all the larger cities and there is the conventional demand for glass windows in all houses in the higher altitudes. Along the hot coastal regions, glass is not so commonly used for windows in residences, for the reason that the climate permits the windows to be kept open throughout the year.

The United States stands second in the exportation of glass to Mexico; Belgium holds first place. The market itself may be considered a free market. Packing is a very important consideration, more particularly since the duty on glass is upon a gross weight basis, and the importer must pay duty upon the crating and excelsior.

The only important glass factory in Mexico is the Vidriera Monterey, at Monterey, which confines its production to bottles. This is a Mexican concern, but the technical men employed in the factory are all Americans.

Netherlands East Indian Fair

In combination with the Fifth Netherlands East Indian Annual Fair to be held at Bandoeng, Java, from June 21 to July 6, 1924, there will be held a National Tea Congress and an International Tea Exhibition. The Tea Congress will deal with the cultivation, preparation, diseases and markets of tea, while the Tea Exhibition will be devoted to an exhibit of machinery and implements used on the field and in the factory, while showing also methods of preparing, packing and transporting tea.

The Fifth Annual Fair is of an international character and gives American manufacturers an inexpensive opportunity to show their products to the Dutch East Indian buyers, who supply a market of over 50,000,000 people.

Exports and Imports of Perfumes

Exports of perfumery, cosmetics, and other toilet preparations in October exceeded imports of those commodities by 12 per cent and were 3 per cent larger than such exports for October, 1922, according to the Department of Commerce. Total exports were valued at $608,879 and imports at $527,014.

U. S. At Utrecht Fair

The Commercial Department of the American Legation at The Hague has decided to be represented at the tenth semiannual Industrial Fair at Utrecht, Holland, with the object of furthering the trade relations between the two countries. The fair will be held March 11-20, 1924.

SALES MANAGEMENT

Five Per Cent of American People Do 95 Per Cent of American Thinking—Be As Good As Your Merchandise

WHO does your thinking for you? Do Sales Managers plan their own campaigns, solve the problems coming up in their own departments, evolve new ideas and work them out, or do they look to others to do this for them while they follow the beaten path of routine, adding new features only as some one else suggests them and works out the details for them?

Harry C. Spillman, Educational Director of the Remington Typewriter Company, New York, in a recent address before the Executives' Club of Chicago, made the startling statement that "five per cent of the American people do 95 per cent of American thinking." Continuing, he said:

"The problem of business in 1924 is to make your men as good as your merchandise. As compared with the commerce of 50 years ago, commerce today is multiplied in its points of contact. For example, we now have the mental contact, the language contact and the faith contact.

"The mental contact is the first of these. The most important thing in business is not the rise and fall of the stock market, but the rise and fall of ideas. There are two kinds of mind—the source mind and the bystanding mind. Ninety-five per cent of the people have the bystanding mind.

"The language contact is important because no man is so poor as the language pauper. To increase our language ability, we must do more constructive reading.

"The faith contact is exemplified by Harry Rosen, who, in 1923 wrote twelve men for $1,000,000 insurance each. He says he succeeded in doing it because he expected to do it."

Salesmanship Is Enthusiasm

Salesmanship is almost 100 per cent spirit and enthusiasm, with a small percentage of mechanism. If a man is a mechanic, working in a factory, he may not be greatly inspired with his job. But if he is a salesman, he is naturally subject to inspiration. He can be enthused, and it will be a lasting enthusiasm if he is of the right quality.

Give a man a sheet of figures and plans and a piece of territory and tell him how much time he is going to spend in each one of those towns and how long it will take him, and you have him weighted down, loaded, and carrying a handicap. It will take a lot of enthusiasm with that fellow, if he ever gets through. You may kill his spirit absolutely. You will kill a man's spirit if you load him down with plans and routing. On the contrary, if you fill him full enthusiasm and let him go out and show you good results, you are going to increase your business.

When a Sales Manager has before him the terrible job of selecting four or five salesmen out of probably fifty applications, it is naturally the desire to get the best man possible. What constitutes the best man possible for selling your product? I think the two things to look for above all others are initiative and enthusiasm. After taking two weeks or three weeks to select the five men, we try to enthuse them on our propsition by three or four months training.

The real Sales Manager is the man who does the planning and who gives the salesman his enthusiasm. If you take enthusiasm away from the salesman you kill his initiative and his personality, both of which are very essential requisites.

The greatest thing that can be said of a Sales Manager is that he is decidedly human. Now, if he is intensely human, you know he has a great heart and possesses those emotional qualities that inspire salesmen to go out and do great things. The great cry today is to "humanize industry," to carry the human element into the organization.

If we want to humanize sales management, one of the big things is to develop these great emotional qualities that mean so much to the selling organization—the ability to inspire men to go out and get their customer's name signed on the dotted line.

Salesmen Are Not Chauffeurs

Is a salesman, driving a company car when soliciting orders, a chauffeur under the laws of the State of Illinois? Attempts are being made, it is reported, in various parts of Illinois to collect a chauffeur's license fee from salesmen who are soliciting orders for their employers and who are driving motor cars or runabouts belonging to their employers.

This situation has been brought to the attention of the Illinois Manufacturers' Association by some of its members who have bumped into this situation, and Colin C. H. Fyffe, General Counsel of the Association, has studied the law and rendered an opinion that it is not necessary for salesmen, employed and working as such, to obtain a chauffeur's license where the operation of a motor vehicle is only incidental to his regular duties.

Sales Points to Remember

Don't argue—illustrate.

Don't ever tell a prospect that he is mistaken.

Don't wear anything to attract or concentrate the eye of the prospect on your dress.

Don't ask the prospect a question to which he can say "No."

Don't talk price; talk quality even though your price is low.

Don't run down the other fellow's goods; talk the reason why of your goods.

Don't talk loud, particularly at the opening of a selling talk; talk low in order to concentrate the prospect's attention by straining his hearing slightly.

Don't loaf on rainy days; they are good days to find prospects in. They haven't so many callers. You don't have to wait, and are permitted to stay longer. It helps a lot.

Don't forget that there are more possible orders in a large number of fair prospects than in a few excellent prospects—so work and make a larger number of calls.

Don't neglect the fact that legs often make up for brains in getting orders—although one isn't much good without the other.

Don't smoke in the presence of a prospect unless he invites you to.

Don't contradict a prospect, even if you're sure you are right.

Don't fail to study the advertising your house is doing in publications of general circulation, and pass on the information to your dealers. It helps wonderfully.

Rubber Assn. of America Elects 7 New Directors

At the recent annual meeting of the Rubber Association of America in New York, seven new directors were elected, as follows:

Three year term—G. E. Hall, President, Boston Woven Hose & Rubber Company; W. F. Pfeiffer, Vice-President and General Manager Miller Rubber Company; A. L. Scheuer, President, Kelly-Springfield Tire Company; C. B. Seger, President, United States Rubber Company; C. T. Wilson, President, Charles T. Wilson Company, Inc.

One year term—E. H. Broadwell, Vice-President and General Manager, Fisk Rubber Company; J. C. Weston, President, Ajax Rubber Company, Inc.

AUTOMOBILE—AVIATION

Chicago's Automobile Show, Displaying 74 Different Makes of Cars, a Success—Record Year Predicted

MORE than 500 well-groomed automobiles, representing some seventy-four different manufacturers of motor cars, have been on display in the Coliseum and First Regiment Armory, Chicago, during the past week. This was the twenty-fourth annual Automobile Show, which opened last Saturday afternoon, Jan. 26, and will close at midnight tonight.

These two huge display buildings, in which the Show has been housed, were most elaborately decorated. The decorative art work came from the studio of Charles Tietzel at Evergreen Park, who has had long experience in this kind of work, and was reminiscent of the Louis XIII and Louis XIV periods.

There were few radical changes found by the visitor to this year's automobile exhibition; rather, manufacturers appear to have given themselves over to seeking greater refinements in the style and comfort of their product. The leading new features of the year, such as four-wheel brakes, etc., have long since been discounted by previous announcements and reports from the New York Automobile Show of early last month. Price changes, as exhibited at the Show, apparently are not greatly different from the past season. Some few advances have been noted, though the tendency seems rather downward.

New cars, seem publicly for the first time in Chicago, were the Rollin, Chrysler and the new Essex Six.

All reports from the Coliseum predict another record-breaking year in the automotive industry. Agents have taken practically every car most of the factories can turn out in the next twelve months, and there will undoubtedly be a shortage this Spring, with considerable delays in deliveries, according to statements by manufacturers and dealers.

Interest of the general public continues as of old, though exhibitions of automobiles and accessories have passed the "feature" stage. Now it is for utilitarian purposes the average citizen goes—being a car owner, it is essential that all new twists and quirks in the business be known and there is no better way to "get wise" than at the Show where all lines run together under one roof—or two, in this particular Show. Dealers report many retail orders during the eight-day exhibition.

Survey of 1924 Auto Field

A careful survey of business conditions for 1924, as affecting the automobile industry, was recently made by George Williams of the Willys-Overland Company, Toledo, O., in which he said:

"In the automobile industry it appears that the large producers of cars have or are expecting shortly to increase production and the number of employes, while the smaller companies, with some exceptions, are not hopeful that the beginning of the new year will show much improvement.

"Most Michigan automobile manufacturers are more optimistic than those of Ohio. Many companies have or are about to announce some wage reductions; however, it is exepected that the reductions made will only be temporary and by March or April the demand for labor will require the increasing of wages, to, or even may exceed, November levels.

"Proposed automobile schedules total better than 5,000,000 cars, including Fords which are estimated at between 2,250,000 and 2,600,000. However, the actual sales of cars may not be more than 3,300,000 or 3,600,000."

Vastness of Automobile Industry In U. S.

Car and truck production	4,005,230
Cars	3,635,230
Trucks	370,000
Previous record of motor vehicle production, 1922	2,659,000
Percentage increase	50%
Total wholesale value cars and trucks	$2,510,885,000
Average retail price of car, 1923	$811
Number of persons employed in motor vehicle and allied lines	2,750,000
Motor vehicle registration in United State (Approx.)	14,500,000
World registration of motor vehicles	17,000,000
Motor vehicle registration on farms	4,250,000
Gasoline consumed by motor vehicles, 1923, gallons	5,404,184,000
Number of motor vehicles exported	328,333
Rank of automobiles and parts among all exports	6th

U. S. Tractors Beat Australian

A plowing trial at Trangie, New South Wales, under the supervision of the New South Wales Department of Agriculture, in which six tractors took part, is reported to the Department of Commerce by Trade Commissioner J. W. Sanger. Three of the tractors were of American make; the others were the Renault (French), Fiat (Italian), and the Jelbart (Australian).

The test was extremely severe, the site selected being a flat paddock, with a hard-packed surface. The soil was mostly red loam, and there were numerous stumps and roots just under the surface. All the tractors were worked as one-man outfits. The paddock was divided in two for the purpose of equalizing as far as possible the nature of the soil and each tractor was required to plow one block on the first portion, and then another on the second. The plots allotted to each varied from 66.2 to 70 acres.

The Jelbart and Fiat tractors were withdrawn before their lands were completed, and the total cost per acre of the others was $1.23, $1.28, and $1.33 for the three American tractors, respectively, and $2.08 for the Renault. The time taken to plow was 54 hours, 7 minutes; 59 hours, 50 minutes; and 61 hours, 56 minutes for the three American tractors, and 53 hours, 57 minutes for the Renault.

The American tractor making the best record was of the tracklaying type. This type is considered to have an advantage over wheel tractors in the rough country districts of Australia and is capable of working all the year through in the bad boggy districts of Victoria.

Ten different makes of tractors are being sold in Australia. Six are American, two are Australian (The Jelbart and the McDonald), and the others are the French Renault and the Italian Fiat.

Mirrors on Motor Trucks

Some manufacturers in Illinois are being arrested because they do not have each of their motor trucks equipped with a mirror, so attached that it will afford the driver a view of the road behind.

This law was passed during the 1923 session of the Illinois State Legislature. It applies to motor cars which are used for pulling or carrying freight, and also to motor cars which are designed and used for the carrying of more than seven persons.

Farm Autos Used Mainly for Business; Touring Car Popular, Says U. S. Survey

AUTOMOBILES on farms are used mainly for business purposes with comparatively little use made of the machines for pleasure, the United States Department of Agriculture has learned in recent farm management surveys. On 1,371 farms surveyed, 923 farmers reported the ownership of 1,000 automobiles or trucks. The owners of the cars stated that from two-thirds to nine-tenths of the use of the machines was for farm business.

In the Atlantic Coast area, covering Chester County, Pennsylvania, 58 per cent of the 423 farmers interviewed had machines. In Middle-Western areas covering portions of Kansas, South Dakota, and Colorado, 70 to 85 per cent of 383 farmers reported machines. In Washington and Idaho in the Palouse area, 86 per cent of 250 farmers reported ownership of cars. The only region where less than 50 per cent of the farmers owned automobiles was in dry farming wheat area, where 315 farmers reported only 152 machines.

The touring car is the most popular type of automobile with these farmers as it can be used for all purposes, from hauling milk or feed to taking the children on Sunday picnics. Two-thirds or more of all machines reported were touring cars. Trucks come next in popularity, about 25 per cent of all machines reported being trucks. Roadsters, sedans and coupes were less frequently reported, totaling less than one-tenth of all machines used.

The low priced car is also the most popular among farmers, over two-thirds of the machines reported being makes that now cost less than $500 for touring cars, f. o. b. factory. The average purchase price of the touring cars was about $700, with an estimated length of life of from seven to eight years. In the different areas the average price paid for small machines was $500 to $600, and for medium-size machines from $850 to $1,250. Most of the machines were purchased during the past eight or nine years, when prices were relatively higher than they are now.

Cost of operating touring cars, including depreciation, was between $200 and $300 per year. Gas and oil made up about 50 per cent of the cash costs, with cost of tires, repairs and license fees making up the balance. Relatively few owners carried insurance on their cars. Gas and oil consumption was found to be about the same for small and medium-sized cars, the light cars being somewhat more economical on gas in some cases, but using more oil on the average in all areas. Tire and repair expenses were somewhat higher for the larger cars. All cash operating costs totaled slightly more for the larger cars, exceeding cash expenses on the small cars by about one-fifth on the average.

Depreciation was found to amount to nearly as much as all cash costs of operation, estimated annual depreciation on the larger cars being nearly twice as much as on the smaller cars, due to higher first cost. Total annual costs, including depreciation, were about $200 for the smaller cars, and $290 for the larger cars.

"Art In Industry" An Aid to Business, Says Speaker

(*Continued from page 10*)

in our esthetic progress? That is natural to a young nation, a nation that has been so universally swept away with the daily needs of physical mastery. Today, we can have beauty such as no nation has ever produced, in everything that we make, but we cannot have it without the proper sort of education, without the proper backing for the production of that phase.

Design is the great lack in American work. We do not know how to design as Americans.

The American public is not going to demand taste in these things until taste has been developed in the American public, but it cannot be developed through pictures and statuary, through the fine arts that are aloof beyond the necessities of daily life. We must make these common things beautiful. We must make everything that we touch, that we need in daily existence, express taste, to gain a lasting satisfaction out of them.

The only way to do that is to develop industrial art schools in this country. There are more industrial art schools in Germany alone than this entire nation can boast of. In fact, we have only three of any importance.

Here we sit in the center of the greatest industrial corner of the earth and have no place to develop designers to create the things that shall make our products valuable.

At the Chicago Art Institute, the greatest institution in the world today, where more people pass through its doors to study its treasures and to enjoy its offerings than any other art museum in the world—not even excepting the Louvre or the Metropolitan Museum—a great institution, where there are 4,000 students of talent, there is an opportunity to develop for Illinois, for this entire great Middle West, an industrial art school. The property upon which that school can stand, adjacent to the building of the Art Institute, has already been given for this purpose. It simply needs an organization, a development, such as the Industrial Art Association, which I believe is an offspring of this Association; and this Industrial Art Asociation, with the backing of the Illinois Manufacturers' Association, can develop a school there which, in three years' time, will have a thousand students of industrial design, who will be taught through machinery as well as through design how to produce a new design, a thoroughly creative thing for fabric, for wood, for steel or iron or jewelry, or in any other form of the basic products that are put into usable form.

Culture Demands Beauty

Our children are reaching out today, through the guidance of their parents, for an appreciation and understanding of beauty, and the moment they get that they are going to demand beauty in everything they buy.

In another generation an ugly thing cannot to be sold upon this continent. Where only the priests, only the princes, only the cultured few in nations gone by, had the chance and privilege of the enjoyment of the esthetic, today all Americans can have that privilege. We are here to educate them, to help them enjoy it.

Let us realize here in the Middle West, in the great city of Chicago, the wonderful industrial art school that can be had, that will bring a return to every industry in Illinois immediately, that will make our product sought not only through this State and this Middle West but all over this nation and probably all over the world. Europe and the Orient accept anything we produce that is definitely American. There is more American music being played in Japan and China today, in all the concert centers of Europe, than European or Oriental music. Our new American form of music—we call it jazz because we apply the percussion instruments which they do not—in the new comprehension of time and melody has been a great contribution to European and Oriental culture, and just as soon as we can produce anything else that has in it the esthetic, the mark of beauty, the expression of our Western world in 1923, 1924, or 1925, we will be able to reach out and command the markets of the world.

The life of American industry, our national prosperity, our own contentment, it seems to me, depends largely upon our ability to add grace to utility. We cannot do it without proper education and that education must come from the schools of industrial art.

Mr. Revell Writes Again to Congress on Income Tax

United States Senators and Representatives have responded liberally to the letter recently sent to them by Alexander H. Revell of Chicago, full copy of which appeared in the Jan. 19 issue of MANUFACTURERS NEWS under the heading "Plea for a Sane Income Tax Policy." So many replies have been received, Mr. Revell announces, that he has made a composite answer, based chiefly on a letter from one Congressman who went into considerable detail in discussing the Federal tax situation and especially the Mellon Tax Plan. Mr. Revell's reply was centered about the following sentence:

"I favor the Mellon Plan as one that will do more for and toward continuous prosperity, and in consequence more for the wage workers of the nation, than any plan or suggestion heretofore made."

BUSINESS AND FINANCE

575 Banks, Chiefly Rural in the Central West, With Aggregate Liabilities of $203,739,138, Failed in 1923

NUMEROUS bank failures in the Northwest since the first of the year have aroused the Federal authorities to seek methods of stemming the tide. Most of these suspensions have been of small institutions, but, when the record of 1923 for bank failures is considered, there seems some food for thought for the Government officials.

While the general strength of the country's banking system is universally acknowledged, the number of small bank failures last year was striking. Most of them were in the rural districts, where they were especially affected by agricultural conditions, such as the wheat belt. However, R. G. Dun & Co.'s figures show that there were 575 banks which failed in 1923, with aggregate liabilities of $203,739,138, or an average of about $350,000 each.

In point of number the increase over the total for 1922 exceeds 108 per cent, and the increase in the indebtedness is more than 160 per cent, the returns for the earlier year having shown 277 banking suspensions for $77,735,551. Even in 1921, which was an unfavorable year, there were 174 fewer banking failures than occurred last year, and the liabilities were smaller by $30,700,000.

The marked increase in banking suspensions during 1923 was confined mainly to two sections of the country—the Central Western and Western states, there being an unusual number in North Dakota where 130 banks suspended, with liabilities in excess of $32,000,000. In the Western states 135 banks were reported as having failed last year for fully $56,000,000, whereas in 1922 the number was 58 and the indebtedness about $16,600,000. Montana alone had seventy-six suspensions last year for more than $33,000,000, and Nevada was the only state in the Western section for which no banking failures were reported.

The number of state and private banks that met with difficulties is reported as 471, with a combined indebtedness of some $154,000,000. Yet the number of suspensions among National banks also increased, the total being seventy-seven and the liabilities exceeding $36,000,000.

1922 Average Tax—$68.37

An average of $68.37 for every man, woman and child in the United States was collected in taxes in 1922 by the national, state, county and city governments and all other civil divisions having power to levy and collect taxes. Taxes collected in that year amounted to $7,133,081,000, the Census Bureau announced.

Taxes collected by the Federal Government in the fiscal year beginning July 1, 1922, amounted to $3,204,133,000 which was almost five times the amount collected in 1912. The per capita of the government's taxes was $29.47, the report says.

The Market for the Week Ending January 26

	High	Low	Last	Net Change
20 active rails .	81.89	80.67	81.89	+ 1.10
20 active industrials	100.00	97.23	100.00	+ 3.40

Sterling exchange . . .	4.23⅜	4.20½	4.23¼	—.00 9/16

Taxes collected by other than the Federal Government totaled $4,228,948,000, an average of $38.90 for each person. General property taxes were $3,329,380,000, or 78.7 per cent of the total.

The state governments collected $867,468,000 in taxes, an increase of 183 per cent over 1912; the counties collected $742,331,000, an increase of 141 per cent; cities and other incorporated places collected $1,627,339,000, an increase of about 80 per cent; townships collected $151,318,000; school districts $738,433,000, and all other civil divisions $102,069,000.

Busy Hours in a Floating Bank

The bank on board an ocean liner is a comparatively new institution, but it seems to be making a place for itself. The ocean office of the Farmers Loan and Trust Company on board the "*Leviathan*" does business with some 4,000 customers, a larger number than many large banks ashore are called upon to take care of during a week.

The main transactions of the bank are cashing travelers' checks and drafts under letters of credit, and changing money from one form of currency to another. On the outward trip the latter transactions are mostly confined to exchange of dollars for English and French money, but on the way back the company takes in almost every kind of European currency, for which it pays dollars at rates of exchange received daily by radio from the New York office of the Trust Company. The ocean bank also issues letters of credit and travelers' checks, which are mostly in demand on the outward-bound voyage.

But changing money and issuing travelers' checks and letters of credit are only what might be called standard operations. On every trip wireless orders are received from New York, London, and Paris to make payments to passengers, and in one case such a payment was effected within twenty minutes. Another type of transaction must be carried out when passengers aboard the ship want to make telegraphic payments ashore. These are handled by radio in code, through the New York office.

Although the ocean bank does not deal in stocks or bonds, it receives stock quotations, which are in great demand from a certain section of the passenger list.

Aside from the cabin passengers and crew, the bank is available to second and third class passengers. It is calculated that 80 per cent of the travelers aboard the ship avail themselves of its banking facilities. And that's not all, because the purser's office, the radio, post-office, Ritz-Carlton restaurant, the shops aboard the ship, barbers and the manicurists all make the Farmers' Loan Office their bank.

U. S. Debt Decreases

The gross debt of the United States on Dec. 31, 1923, was $21,914,000,000, compared with $22,986,000,000 the year previous, being a decrease of $1,072,000,000. After deducting the balance in the General Fund of $325,000,000 and amounts due us from other governments of $11,668,000,000, we have a net national debt of less than $9,922,000,000, compared with $10,792,000,000 a year ago. Our net national debt, as of Dec. 31, 1923, was $88.70 per capita, compared with $97.72 a year ago.

World Gold Production

Gold production for the world during 1923 totaled 16,187,000 ounces; the value was $335,000,000, compared with a production of $365,000,000 the year before, $321,000,000 in 1921 and $470,000,000 in 1915, which marked the high point in the output of new gold. United States production for 1923 was 2,485,000 ounces, compared with 2,363,000 ounces in 1922.

‹cise Tax on Auto Truck Hoists Is Imposed by U. S.

\ letter received from the office of the
mmissioner of Internal Revenue by Mrs.
bel G. Reinecke, the Chicago Collector,
of interest to manufacturers in that it
ovides a new ruling concerning the tax
certain automobile parts.

Summarized the letter states that while
the past hoists for automobile trucks
d automobile wagons have been consid-
d raw material and not subject to tax
der section 900 (3) of the Revenue Act
1921, additional facts have been gath-
ed concerning the status of hoists as fin-
ed parts and it was found by the Bureau
it its previous holding was erroneous.
at holding was therefore revoked.

It is now held that hoists designed and
apted for use on automobile trucks and
tomobile wagons are finished parts with-
the meaning of the law and regulations
d subject to tax at the rate of 5 per cent
the price for which they are sold by
e manufacturer thereof.

osts Experts Raise Living Standards: S. M. Hastings

"Men who figure out the costs of factory
roduction are raising the standard of liv-
g in the United States," said Samuel M.
astings, at a dinner given by the Southern
ivision of the Illinois Manufacturers'
osts Association at the Missouri Athletic
ssociation, St. Louis, recently. Mr. Hastings is President of the Dayton Scale Company and Mayor of Highland Park, Ill.

"You men," said he, "by your graphic statistics make it possible to eliminate waste, increase efficiency and cut production costs. Consumers get the benefit."

Then, just to show how high the standard of living is in the country, Mr. Hastings quoted the following figures expended upon "necessities in 1922:"

Passenger automobiles	$2,000,000,000
Tobacco	1,500,000,000
Theatres	804,368,000
Ice Cream	527,000,000
Candy	500,000,000
Cosmetics, including lipsticks	500,000,000
Jewelry	405,000,000
Chewing gum	52,000,000

"You men have aided," continued Mr. Hastings, "in the American manufacturing ingenuity and speed that has made it possible to put an automobile and a phonograph in almost every American home."

Vitrolite Company Issues Book on Home Decoration

Vitrolite in the home, decorative and sanitary, is the subject of handsome brochure, beautifully illustrated, recently published by the Vitrolite Company, Chicago. It is dedicated to the "castle of man's soul, where abiding peace, rest and comfort are found."

Uses for Vitrolite in the bathroom, kitchen and pantry, fireplace, vestibule, dining room, breakfast nook and play room are presented, together with a history of colored wall treatments from ancient times to their present state of perfection.

"Vitrolite defies the challenge of bacteria, dirt, dust or grease," says the booklet. "No acid or alkali will in any way either modify or destroy its surface. In a test made by the Department of Applied Mechanics of Northwestern University, Chicago, the surface of Vitrolite has seven times the abrasive resistance of marble. The Carnegie Institute of Technology, Pittsburgh, determined by actual test the tensile strength of Vitrolite as one-half again greater than marble, and its crushing strength greater than concrete."

It can be attached to any wall that is plastered straight, plumb and true, so it is equally adaptable for homes already erected or those being built.

How Taxes Have Jumped

The National Industrial Conference Board shows that the people of the United States paid in taxes last year $7,061,000,000, against $2,194,000,000 in 1913, and $1,382,000,000 in 1903. Ratio of taxation to the national income was 6.4 per cent in 1913, 12.1 per cent in 1919, 16.7 per cent in 1921, and 12.1 per cent in 1922. The tax bill last year was $64.63 per capita, against $17.07 in 1913.

Pine Association Meeting

The ninth annual meeting of the Southern Pine Association will be held in New Orleans on March 11 and 12.

Limitless

No other word applies adequately to the facilities of this organization to serve manufacturers who use wood in making or shipping their products.

In our Chicago yard of 45 acres are piled thousands upon thousands of feet of all kinds of crating lumber.

Your phone call will start your order towards your factory today.

Just as promptly can we furnish maple, oak and yellow pine flooring, heavy timbers, piling, or any wood you need in the production of your goods, in any size or amount.

In Chicago and suburbs a system of twenty branch yards, ably managed and adequately stocked, means quick deliveries and lower delivery costs.

Phone us, wire us, write us for anything any time. Insure your service to customers by having unlimited service for yourself.

Edward Hines Lumber Company
Main Office, 2431 S. Lincoln Street, Chicago
Telephone Canal 0349

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can — that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

All Size Trucks for Rent

Dump Trucks

By the Hour, Day, Week or Contract

We handle anything, anywhere

"True Costs" Are Essential to Bring Business Success

(Continued from page 13)

tain a series of running statistics showing yields obtained on materials processed and the cost per unit of production in its various stages, and, by comparison, point out to the management whether the plant is being operated as efficiently as it should be. These statistics should be compared against previous months' costs and, if more than one factory is operated, the same units at the different factories must be compared.

Check Sales Weak Spots

Selling costs should also be checked, and the cost to sell quoted, sales per man per week or month, in the terms of tonnage or volume shown, to point out weak spots. One of the functions of the Accounting Division is to point out such conditions, leaving it to the management to apply the remedial measures.

In a general way, and from the point of view of cost finding, the various types of maufacturing operations may be divided into three classes, each requiring a particular method of figuring or cost finding. They may be stated as follows:

1. Costs for ordinary manufacturing operations.
2. Costs for operations producing major products and by-products.
3. Costs for operations producing joint products.

The general procedure under the costs for ordinary manufacturing operations is a very simple operation. The steps are as follows:

1. A known amount of material of a determinable cost is used.
2. A definite amount of labor of ascertainable cost is expended.
3. An average amount of overhead expense is absorbed.

The total is the cost of the finished goods from a factory standpoint, to which must be added the average cost to sell, plus a figure representing profits. Costs do not always determine selling prices, but they should always serve as a guide. There are times when it is necessary for the Selling organization to shade its prices to meet keen competition, and other times when it is able to obtain prices above the regular schedule and, as a guide at all times, the costs as presented should be accurate.

(The second and final installment of this article will be published in the next issue of MANUFACTURERS NEWS.)

Building Arsenic Acid Plant

The Commercial Chemical Company is building a plant for the manufacture of arsenic acid used in the production of calcium arsenate, needed in the destruction of the boll weevil and other field insect pests. In addition to this plant, the Company is also erecting a building in which to manufacture the metallic drums in which the calcium arsenate is shipped. It will have a capacity of 100,000 drums annually. These plants are expected to be in operation soon, according to W. D. Cannon, President.

Western Union to Deliver Own Messages In France

With the beginning of 1924 the Western Union Telegraph Company is accepting and delivering cablegrams directly to and receiving them from the public in Paris, France, according to an announcement by that Company. While the Company has maintained an office in Paris for many years, heretofore the French Telegraph Administration would not permit it, or any other independent cable company, to deal with the public direct, causing some delays, for it was necessary for the messages first to be delivered to the French Administration and it, in turn, delivered to the party addressed. The new management will enable the Company to render a more expeditious service, similar to that rendered in Great Britain and Holland.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

EARLY three times as much electricity is made now as in 1912, according to port recently issued by the Department Commerce. It covers the generation of tricity by central stations, both com-cial and municipal, and by electrical ways for the 10-year period, 1912-2.

he official totals for central stations are ollows:

912....17,621,808,893 kilowatt-hours
917....32,678,806,061 kilowatt-hours
922....45,307,536,711 kilowatt-hours

These figures show an increase of 85 cent in the total current generated ween 1912 and 1917, while the 1922 al marks an increase of 157 per cent for 10-year period.

It is estimated that for 1923 the energy oduced will reach a record total of ap-oximately 56,500,000,000 kilowatt-hours. al figures for the past year have not yet en completed.

From a survey based upon the rate of owth of the electrical industry, the new es to which electrical energy is being t, and the extensions that were made in 23 or that are under construction, it is edicted that by 1935 the nation's electrical nsumption will reach 150,000,000,000 owatt-hours a year, or more than three nes the 1922 rate of use.

Extensions and improvements of a value $602,000,000 have been made by the ectrical central stations of the country ring the year just closed. Among the ore important were:

Steam electric plants, additions and ex-nsions, 1,987,000 kilowatts, costing $209,-7,000.

Hydro-electric plants, additions and ex-nsions, 903,000 kilowatts, costing $74,-96,000.

Extensions to transmission systems, 125,200,000.

Extensions to distribution systems, $193,-30,000.

Calumet Electric Reorganized

Reorganization of the Calumet Electric ompany as the Calumet Gas & Electric ompany, furnishing service to a number f Northern Indiana cities and towns, with amuel Insull of Chicago as President and harles W. Chase of Gary, Ind., as Vice-resident in charge of operations, has been erfected. The Company furnishes elec-ric service to East Gary, Crown Point, owell, and several smaller communities n Indiana, as well as power for the Gary treet railway system and interurban lines.

Engineering Course Is Offered

An advanced course in engineering, in-ended primarily to give special training o men who have exceptional qualifica-ions for designing engineering work, has been established for student engineers in the employ of the General Electric Company. The course will be under the direction of R. E. Doherty, a consulting engineer of the Company, assisted by A. R. Stevenson, Jr. The number of students in the course, during the first year, will be limited to thirty and this number will be reduced to about ten at the end of the first year. The course will extend through three years and is intended to develop a thorough understanding of physical laws and a facility for applying them, a familiarity with manufacturing processes, ability to express thoughts clearly and whatever native ability in creative work the student may have.

Electric Railways Stronger

Although great difficulties have confronted the electric railways of the country in the last ten years, particularly during the war and since, in keeping the cars running, the industry is growing stronger daily, James W. Welsh, Secretary of the American Electric Railway Association, says. In proof of his statement, Mr. Welsh offers these facts:

In 1922 there were 117 electric railway rides sold for every man, woman and child in the United States. In 1917 only 109 were sold and in 1912 only 100.

More than 13,000 new cars have been put into service during the last five years.

There are 80,000 electric railway cars operaing in the United States.

About $250,000,000 will be spent for improvements this year.

Much useless track has been done away with in recent years and supplemental bus service added.

"Electric railways have come back," Mr. Welsh says. "The foregoing facts demonstrate it."

341,000,000 Electric Lamps Made

Three hundred and forty-one million electric lamps, or nearly a million a day, were made in the United States during 1923, establishing a new high record for the industry, says the New York State Committee on Public Utility Information. This is 36,000,000 more than were made last year, and 6,000,000 more than were made in 1920, the previous record year.

Of the 341,000,000 lamps manufactured this year, only 1,000,000 were of the carbon filament type, the rest being tungsten-filament lamps of various sizes. One hundred million were miniature lamps for use in automobile headlights, electric torches and on Christmas trees.

Victor Murdock, a member of the Federal Trade Commission since 1917 and three times its Chairman, has resigned. President Coolidge has appointed in his place George B. Christian, Jr., who was Secretary to President Harding.

"STATION TO STATION" Service Is Quickest

THOUSANDS of long distance telephone calls are made on the "station-to-station" basis, that is, the calling party asks only for the number of the called telephone or gives the name and address of the called subscriber without designating a particular person.

This service is the quickest and it saves you about 20 per cent.

In many cases the person you want will answer or is immediately available; if not, you can often deal satisfactorily with the one who answers.

"Long Distance" will be glad to tell you more about this time and money saving service.

"Station-to-station" long distance calls meet almost every requirement and the day rates are about 20% lower than for "person-to-person" calls. Evening rates are about 50% and night rates 75% lower than day rates for "station-to-station" calls, but no rate is reduced below 25 cents. Consult the telephone directory for further details or call "Long Distance."

Advertising is the Sunlight of Business

To all that is healthy and vital in business, it means increased strength and growth; but advertising is a fierce heat which withers and consumes that which is unsound.

A business which is not a good business should not be advertised. A business which would not benefit from widespread appreciation of its ideals had better acquire a new set of ideals.

Made-to-Order INDUSTRIAL BUILDINGS

It is better to build, rather than to purchase a plant ready made. ❧ It is cheaper. ❧ A factory or warehouse constructed for someone else, requires considerable remodeling to meet your needs; even then it may not turn out satisfactorily. ❧ But when you order a *Central Manufacturing District* plant made-to-measure, you are assured of getting just what you want, when you want it, and at the lowest cost. ❧ We are organized to build factories that suit. ❧ All our plants are on private Chicago Junction switchtracks, assuring efficient freight service. ❧ We finance building. ❧ We will handle everything for you — land (purchase or rental), building plans, and construction. ❧ That is our business.

The Reasons for Congress Success

On some not far distant day, when the Congress is a much larger institution, there will be interesting speculation upon the reasons for its success. Those who have been its guests know that there is nothing phenomenal about that success. For many years there has been a consistent policy of unstinted, hospitable service, appealing to all people. Congress guests know, as the Congress management knows, why the hotel grows greater every year.

Selling the Man Your Salesman Never Sees

Big orders are often lost because the man your salesman sees can't resell the proposition to some man your salesman doesn't see.

In some household, some inner sanctum, some director's room, some banker's private office the decision goes against you without your ever having had a chance to present your case.

Into these blue pencil rooms where salesmen seldom penetrate advertising goes whenever you choose to send it.

Because of this it sometimes pays to use widespread advertising to influence a comparatively small number of people. Though 95 per cent of the readers of the publication may never be in the market for your product, the value of reaching the other 5 per cent may be so great as to justify the cost.

Straightening Out the Northwest

A CONFERENCE called by President Coolidge was held in Washington this week to take some action regarding the agricultural credit situation in the Northwest. Chicago's two leading mail order houses are represented and also one of the largest clothing houses. Other interests represented are farmers, merchants, bankers, and transportation companies.

It is suggested that the conference take into consideration the number of excess banks in the Northwestern states. An investigation will probably develop, as pointed out recently by the *Chicago Journal of Commerce,* that there are too many banks for the amount of business, just as there are too many coal miners and too many coal operators for the amount of soft coal used in this country.

Encouragement to enter the banking business in the Northwestern states was afforded by laws guaranteeing depositors from loss. After passage of these laws a great many persons went into the banking business. Everybody wants to be a banker in the Northwest. It is like the craze for white collar jobs in large cities. It is another exhibition of the growing tendency to avoid manual work. By this time the surplus bankers have discovered that the "easy money" was not so easy.

The position of the farmers in the Northwest is not so bad as has been painted. Figures published by the United States Department of Agriculture for crop returns in four states, for the years 1921 to 1923, show the following financial returns for the nine principal crops (000's being omitted):

	1923	1922	1921
Minnesota	**$265,212**	**$247,942**	**$182,571**
North Dakota	**141,316**	**214,825**	**135,273**
South Dakota	**178,510**	**167,993**	**106,138**
Montana	**87,487**	**86,617**	**63,047**

It will be noted that the crop income for these states shows an increase with the exception of North Dakota, which had a severe set-back in wheat in 1923; but even in North Dakota the 1923 crop income was larger than in 1291.

The corn crop in 1923 amounted to $191,254,000 as compared with $142,855,000 in 1922. There was an increase of $3,000,000 in the value of the oats crop; of $24,500,000 in the flax crop; potatoes showed an increase of $5,000,000 in value, and wild hay an increase of approximately $8,000,000. Wheat, barley, rye and tame hay showed decreases.

Farmers at the recent Farmer-Manufacturer Convention, held under auspices of the Illinois Manufacturers' Association, were optimistic. They resented being considered bankrupts or poverty stricken. What they need is better marketing agencies, cheaper labor and fewer banks.

Tell Them About the Mellon Tax Plan

ANNOUNCEMENT has been made that a bureau has been organized for the assistance of the employes of the Western Electric Company in making out their income tax returns. There are 37,000 workers in the big plant at Hawthorne and most of them pay income tax.

If we may be permitted to make a suggestion to the Income Tax Bureau, it is that they tell the employes how much they would save if the Mellon Tax Reduction Plan were adopted in substantially the form in which it was presented.

It provides for a reduction of 25 per cent in earned incomes and for the removal of a large part of the heavy surtaxes which interfere with business expansion.

The employes of this big electrical supply house, if they would get their views to Congress while the tax bills are under consideration, would materially aid in reducing the Federal tax burden.

Woodrow Wilson

WOODROW WILSON, our president from 1913 to 1921, who guided the nation courageously and safely through the greatest war in all history, is dead. Our country is plunged into profound sorrow. The world pays tribute at his bier. History will accord Mr. Wilson his proper place as one of the world's greatest men.

He was a man of brilliant intellect and highest ideals, whose public life, particularly during the world's greatest crisis, was devoted to his country's interest and the needs of humanity as he conceived them. He was stricken in 1919 while fighting for those ideals. He was not an opportunist guided by personal ambition, and political expediency did not always guide his course, but his sincerity never has been questioned. He stood firmly for what he thought was right in the international complications that followed the war. He always will remain a heroic figure in the hearts of the people.

Will There Be a Soft Coal Strike?

ONE hundred ninety-six thousand, two hundred sixty-seven factories, with 6,946,570 wage earners (1921 U. S. Government census) are asking this question. They are all more or less interested. They either buy coal or buy power. The strike will mean inconvenience, loss of time and probably increased cost of fuel. A leading soft coal operator, who was asked about the possibilities of a strike replied:

"If anybody could answer that question, he could make a lot of money."

The truth is nobody knows, and won't know until about the middle of February. At the National Convention of the United Mine Workers Association at Indianapolis a Policy Committee was appointed. This Committee will decide whether it will be wise to call a strike in April. There will be a conference between the coal operators and the miners in Jacksonville, Florida, on Monday, Feb. 11. The next day the miners will present their demands for a four-year contract at present inflated wages. The mine operators will respond, and then there probably will be an adjournment until the middle of the month to consider the respective propositions before any decision is reached.

If the United Mine Workers of America are wise—which is almost too much to expect—they will not be unreasonable in their demands upon operators and consumers. They have been pretty belligerent in their sessions at Indianapolis.

There was a reserve supply of 60,000,000 tons of soft coal in the United States on Jan. 1. By April 1 this will be increased to 75,000,000 tons, which is about three times the usual reserve supply of soft coal. Sooner or later the American public is going to rise up in its might and swat the United Mine Workers of America in the eye.

No political party, and no labor union, nor even any army, ever got the best of the public in the long run.

Where Lower Freight Rates Won't Help

WITHIN the last three years at least six railway lines, two steam and three electric, have been abandoned or are in process of being abandoned in Illinois, according to the *Orange Judd Farmer*. As a result, 325 miles of main line, serving fifty-eight cities or towns, twenty-nine of which have no other railway connection, are ready for the junk pile.

One of these roads, the Chicago, Peoria & St. Louis Railroad, served a population of 372,000 people. If it is permanently abandoned, as seems quite likely, it will decrease real estate values by more than $8,000,000, with depreciation in farm lands estimated at from 10 to 30 per cent. This is a serious proposition for the people of Illinois, particularly the farming community.

What is the cause? Principally the higher cost of operation, including wages, coal, rails and other supplies. Another reason, of course, is that they cannot charge the price that the service must secure to meet expenses and show a little profit. This is one of the cases where reducing of freight rates on farm products will not help. The only logical preventive for such a calamity is legal permission for such railroads to charge not lower but higher freight rates.

Meanwhile, Senator LaFollette and his merry little crowd of railroad baiters, are devising ways and means in Congress to prevent the railroads from making too much money.

Check on New British Labor Ministry

Premier Ramsay MacDonald Cannot Retain Leadership of the Empire Without Coalition With Liberal Party

AMERICANS have been watching the recent upheaval in British politics with keenest interest. The defeat of the old political parties—Liberals and Conservatives—by the Labor party marks a new era in the history of the Empire, an event that undoubtedly will go down in the pages of history as a turning point in the civilization of the British Isles. For the first time the working man is in the saddle, with an opportunity to show the world what can be done with the ideals for which he has been struggling.

What will he do with his new-found power?

This is the prime question of the hour, not only in England, but throughout the world. Generally, the elevation of the Labor party is regarded with equanimity. In the first place, it holds power by a slender tenure, depending entirely upon its coalition with the Liberals. Nothing can be done without the vote of the Liberals, and any radical action would undoubtedly lead to a coalition between the Liberals and Conservatives which would turn the Labor party out of office overnight.

It is, however, of great interest to study what the Labor party, headed by Ramsay MacDonald, stands for, and the following article gives some interesting sidelights.—Editor's Note.

WHAT will the new Prime Minister, James Ramsay MacDonald, do to cherished, age-old English institutions?

American manufacturers and economists are viewing with much interest but no alarm the recent installation of the Labor party in the seat of government in Great Britain.

The English always have been a solid race. Even the union labor element there is apt to be conservative, and although Mr. MacDonald does not yet wear knee breeches and silk stockings, the chances are he will before he steps down and out. The London stock market, following the day he kissed King George's hand, was characterized by general rises. Investors were not inclined to part with their holdings even under a Labor regime.

The truth is that Mr. MacDonald and his colleagues, although in office, can do nothing without the Liberals. With the Liberals they have a majority of about 100 over the Conservatives. If the Liberals do not take a fancy to some of Mr. MacDonald's innovations (he has done nothing sensational nor unusual) they could form a coalition with the Conservatives which would give a majority of about 225 to bear against the Labor party.

When it comes to foreign affairs, Mr. MacDonald has considerable authority. The British Foreign Office can do almost anything without the consent or even the knowledge of Parliament. It could recognize Russia or it could destroy British supremacy in India. The chances are Mr. MacDonald will not do anything rash. He knows the British workman would be the first to suffer if the good old British Ship of State were scuttled.

BRITAIN'S NEW LABOR PREMIER P. & A. Photo

J. Ramsay MacDonald and Members of His Cabinet Leaving Buckingham Palace After Calling on King George

Left to Right—J. H. Thomas, Secretary for the Colonies; Premier MacDonald; John R. Clynes, Lord Privy Seal, and Arthur Henderson, Secretary for Home Affairs

A sidelight on the views of some of the leaders of British organized labor is furnished in a book, "What We Want and Where We Are," recently written by W. A. Appleton, Secretary of the General Federation of Trade Unions in England. Mr. Appleton, unlike most American labor leaders, has a pretty good idea of economic laws and their effect upon the labor situation. His comments, written in 1922, in view of the fact that the Labor party is now in power, are interesting.

"If and when it comes into power, will the Labor Party succeed in making trade better or man happier?" asks Mr. Appleton. "There's the rub. It will start with a very heavy handicap. It has sown a crop of promises, and it cannot escape the harvest. The economic fantasies advocated by various of its groups have appealed to the unthinking as a fairy tale appeals to a child, and there will be terrible disappointment if the promised employment fails to materialize, or the money to pay unemployment benefit cannot be extracted from an over-taxed and debt-embarrassed country.

"Levies on capital are, or were, easy and attractive subjects to talk about. They appear to offer such simple and efficacious means of meeting financial liabilities. Today, not so much is said on this subject. Its discussion has shown, not only the difficulties of preparing and giving effect to any scheme, but has emphasized the fact that to unduly tax capital is to dissipate it, either by forcing it to find sanctuary in other countries, or to encourage wasteful spending in order to dodge taxation.

"Even those who were originally enamoured of this way of meeting indebtedness are now beginning to see that it is better for man to earn his own living than to poach on the savings of his neighbor or his grandfather.

Foreign Problems A-Plenty

"Apart from, but in addition to, the financial liabilities and social expectations which will await it, a Labor government would be faced with problems to which, as a party, it has given little attention. It will have to govern an Empire, even though within its ranks imperialism has been anathema. The Dominions, India, and Ireland cannot be dismissed by the utterance of a phrase or the passing of a resolution. Their interests are interwoven with, and, for the time being, dependent upon those of Great Britain. The consideration of these interests will call for the exercise of capabilities not yet manifested by the Labor party. Mistakes will bring swift punishment from those who have been led to expect too much.

"Neither governments nor parliaments can override economic law, and the attempt to do so has brought revolution very near to us. Get back, or perhaps forward, to sane conceptions; let capital and labor settle their differences between themselves, and let the State content itself by keeping the ring, interfering legislatively only when life and health and material are in danger.

"The strikes of today are not against capital, they are against society—society as represented by the hundreds of thousands of girls and women who tramp to work through the snow and slush because a few motormen misunderstood or desired to repudiate a contract, or a few railwaymen* are disgruntled. Some strikers realize the baleful effects their actions must have on the community and on trade, but their faith in authority's power to protect them has weakened, and they drift to the side of the revolutionary."

On the subject of unemployment, causes and remedies, Mr. Appleton, as far back as March, 1919, wrote:

"Industry cannot be operated successfully if the wages paid exceed the value of the articles produced. In such circumstances, industry ceases to be profitable and can only be carried on by the depletion of reserves and with the certainty of bankruptcy.

"High wages, short hours, cheap food and cheap housing accommodation are desirable things, but they are impossible apart from high efficiency and maximum production.

"Unless he learns this lesson, the worker will pay in unemployment and in personal degradation and he will involve his wife and children in his debts and their consequences."

It is not thought that Mr. MacDonald will undertake to levy a tax on capital. Here is what Mr. Appleton says on that subject:

" 'Capital levy' has been the proposal of many and it is said that even the Chancellor of the Exchequer regarded the proposition with favor. It is still the premier plank in the program of the Labor party. Of all the easy solutions of existing problems this seems the most attractive. It claims to take from him that hath not, all that he has, and to give to him that hath not, all that he hasn't.

Favors Decreased Expenditures

"It never seems to strike the advocates of this solution that capital is essential to maintaining the expansion of industry, or that its dissipation accentuates the difficulties of today: In the face of the facts of rating and taxation, one wonders how the advocates of capital levies, or the latest form of the same proposal—a tax on accumulated wealth—would proceed. It is said that local rates, which in 1904 were about £100,000,000, had risen in 1919 to £194,000,000 and are estimated to rise in 1921 to £250,000,000 while we know that Imperial taxation has risen from £200,000,000 to £400,000,000.

"These figures suggest that the real palliatives lie, not in the direction of increased levies or taxation, but in decreased expenditures.† You cannot have your cake if you have eaten it, and you cannot develop your trade with capital that has been dissipated.

" 'State Maintenance': Here the position is not easy. The State has made many demands upon men; it has made them many promises; it has weakened moral fibre, and by continued interferences in trade and commerce, it has hampered recoveries. It is, consequently, under obligations which justify a demand for assistance. But this assistance, in the nature of things, can only be temporary. Sooner or later, the reserve of liquid capital will be exhausted and doles become impossible. The formula, 'maintenance or work' has been amended to read 'preferably remunerative work.' Maintenance without work means universal pauperism, to be followed by national bankruptcy. Work at preferably remunerative rates implies the possibility of subsidized work, which is another form of pauperism, or it means work which produces articles which can be sold in the world's markets at prices which leave a margin for wages. The question arises as to who is to organize the work, who is to sell the articles and who is to fix the wages. The answer presumably is, the State. In that case, God help the workman.

British Labor's Trial

THIS is what James Ramsay MacDonald and other members of the new British Labor Ministry will have to wear (to be in style) when they call on the King:

Coats of blue cloth, with collar and cuffs of black velvet, nine buttons up the front showing between two embroidered edges, which are made to hook, two at the waist behind and two at the bottom of the black skirts. White silk linings. A white collar may be worn inside of the collar of the coat. Gold oak leaf embroidery and gilt mounted buttons with royal arms.

Knee breeches of white kersey, with white hose, black patent leather shoes, black beaver hat, with black silk cockade, gold bullion loop and white ostrich feather border. Sword, regulation pattern, with black scabbard, gilt mountings, a knot of lace at the belt, white webb with white cloth frog and gilt buckles at the knee and shoes of rose shamrock thistle pattern.

The outfit costs $640, but may be rented for $4.50 a night.

"Attempts must be made to maintain those who cannot obtain employment, but the community cannot be expected to maintain those who evade work. Every time this is attempted the common standards are lowered, the aggregate liability increases and the conditions which precipitate unemployment become more acute.

"It should be the business of the Trade Unions and the Employers' Associations to see that neither men nor women willing to work, lack opportunity. In the new Trade Unionism which I hope to see develop, it will be understood that employment of the able-bodied is quite as dangerous to the Unions as it is to the community. It always effects reductions in wages, or, to be more accurate, in the value of wages. These reductions are not always obvious, but they are, nevertheless, real. The cash received by those employed may be the same, but public opinion in Britain has decreed that the willing worker shall not starve, and if he does not earn his own living, it must be earned for him by the people who remain at work. The days of manna are passed, and there are no longer inexhaustible cruses of oil.

The Duty of Trade Unions

"It is held by many Trade Unionists and by the dilettanti who advise them, that the effective absorption of these men would lead to continued over-production and an accentuation of unemployment. I very seriously ask those who hold this view to study the world's circumstances, and to face courageously the conclusions these circumstances suggest. The fact that millions are dying for want of goods, and that millions who can make goods are unemployed, suggests that many earlier conclusions are wrong, and that there are other and graver causes of unemployment. It is the duty of the Trade Unions to probe the circumstances until these causes are laid bare and the real remedies propounded.

"An investigation such as I suggest will probably prove that, as like breeds like, so work accomplished breeds the possibility of more work to undertake: that employment tends to create employment by developing purchasing power. Much of the hostility to the absorption of the unemployed in industries that require labor is due to carefully fostered prejudices and to the mistaken idea that price and value are synonymous terms. Men may receive very high prices for their work, without these prices enabling them to purchase comfort."

New Wood-Working Machine

The Dewalt Manufacturing Company of Bridgeton, N. J., has recently placed on the market a small wood-working machine that will do cross cutting, ripping, mitering, beveling, matching, moulding, irregular shaping, dadoing, routing, sanding, boring, turning, fluting, tenoning and panel raising on any rake or bevel. It is known as the "Dew-All." This machine is electrically driven and because of its universality it should appeal to manual training schools and wood-working shops.

The midyear Safety Conference of the National Safety Council's Engineering Section, the Chicago Safety Council and the Western Society of Engineers, will be held at the Morrison Hotel, Chicago, on Tuesday, Feb. 19.

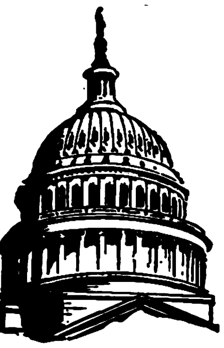
*The recent railway strike, after days of public discomfort and much loss of pay by factory and other employes, was compromised.

†Good advice for this country.—EDITOR.

All Nation Mourns Death of Wilson

Partisan Political Row Over Teapot Dome Oil Leases Temporarily Halted by Passing of Great War President

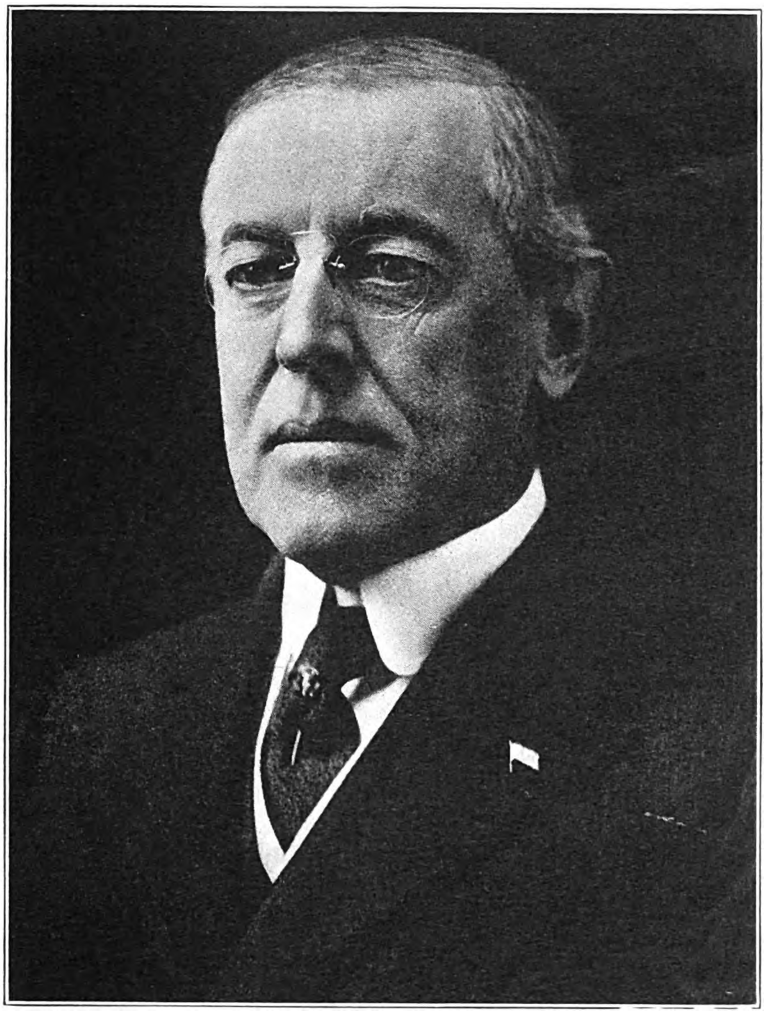
By JOHN M. TOWNSEND
Washington Correspondent, Manufacturers News



Washington, D. C., Feb. 6—Sensational disclosures before the Oil Investigating Committee, together with the fatal illness and death of Woodrow Wilson, have afforded Washington an experience of mixed emotions this week beyond the ordinary. Partisanship has seldom, if ever, been so rampant in Congress as now. The one serene mind in official life seems to belong to the man in the White House, who is carefully, courageously and conscientiously keeping step with developments day by day, and exercising all the powers of his office for the immediate protection of the Government's interests. The death of Mr. Wilson has called a temporary halt in the political row while the nation mourns his passing.

DEATH OF WOODROW WILSON—In the death of former President Woodrow Wilson, the world has lost one of its foremost citizens. Mr. Wilson was one of the few great Americans who was entitled to be called a citizen of the world. Since civilization has extended itself to all quarters of the globe, no one man has ever enjoyed the influence and power of leadership over the peoples of the earth such as Mr. Wilson wielded in the closing years of the great World War, and immediately thereafter. No man anywhere will dispute the fact that the great principle of world peace, for which Woodrow Wilson stood as champion, was right. Men might disagree with him as to time and method of its application, but he will go down in history as a leader in the cause of humanity whose acts will be cited and words quoted long after his generation shall have passed away. His labors for the welfare of his own country, in accord with the political principles in which he believed, should not be forgotten. The world has lost a citizen, the United States of America has lost one of its faithful servants and statesmen, and the Democratic party has lost a leader whose influence remains, though he himself has gone from its councils.

OIL INVESTIGATION DISCLOSURES—In appointing special counsel to investigate and prosecute all criminal acts, and to recover for the Government all Naval Reserve oil lands illegally leased, President Calvin Coolidge laid his hand on the one method possible for a permanent determination of the issue involved in the Senate Committee's oil investigations, which are now the subject of bitter partisan debate in Congress. If there is to be any final arbitrament of these issues, it must be in the courts of the land. The oil scandal, which began with the taking of a loan of $100,000 by Albert B. Fall from Edward L. Doheny, and of another loan of $25,000 to Fall from Harry F. Sinclair, has sent the public mind rippling so far afield that men who have had any connection whatever with the oil industry, legitimately or otherwise, hesitate to make that fact known. Suspicion, partisan charges, and the excited state of the public mind do not make for calm judgment, or even justice, in some instances. By his move, the President has not only taken a step which had to be taken sooner or later, but he has pointed the way to an abandonment of partisanship in getting at the facts, not only with respect to the Government's interests, but also the interests of those who might be unjustly maligned even by the mention of their names. On all sides here there is a determination to get the truth. However heated partisanship may still be, there is no disposition now to prevent the whole truth from being brought to light.



Keystone View Co.

Woodrow Wilson

TWENTY-EIGHTH PRESIDENT OF THE UNITED STATES
Born December 28, 1856 Died February 3, 1924

EFFECT OF DISCLOSURES—The disclosures to date have had both a personal and political effect. They have fallen hardest upon former Secretary of the Interior Albert B. Fall, who not only took a loan of $100,000 while in the Harding Cabinet, and later allotted a Naval Reserve oil lease to the man who loaned him the money, Edward L. Doheny, but his situation was made infinitely worse by the bungling methods he employed to cover up this transaction, instead of frankly admitting it when called upon to testify. Mr. Fall, of course, would have suffered even from such a frank disclosure, but not to the extent of being under the suspicion which now rests upon him. Secretary of the Navy Edwin Denby, who signed the oil leases with him, has been fully acquitted by the Senate Committee of any suspicion of fraud or corruption in his official acts, but he does stand charged with incompetence in having failed to resist the transfer of the Naval Reserve oil lands to the Department of the Interior, and with having exceeded his powers in so doing. Whether or not Mr. Denby will eventually resign, is a moot question, but the indications are that he may retire when all doubt as to the good faith of his official acts has been entirely removed, not only from the Senate but from the public mind. Now the oil investigation has branched out far enough to show that William G. McAdoo, Thomas W. Gregory, Franklin K. Lane, and Lindley M. Garrison, all Cabinet officers in the Wilson Administration, have been legal representatives of the Doheny interests since retiring from their official positions. It will branch out still further when the stockbrokers are called upon to show from their books whether or not public officials in Washington have been dealing in the stocks of either the Sinclair or the Doheny companies, or in other oil securities related to them, the presumption being, until it is disproved, that they were acting on information relative to the leases these companies were about to secure from the Government. At this writing, there is no telling how far the investigation may further ramify before it is concluded.

POLITICAL EFFECT—There can be no question but that the Republican party as a whole suffered in public opinion throughout the country when the disclosures concerning Mr. Fall first became known. It is an encouraging sign of the state of public mind, however, that when the Democratic spellbinders in the Senate attempted to drag President Coolidge's name into the scandal without an iota of evidence to proceed upon, that public opinion immediately reacted unfavorably. Up to this time, there is no evidence to show that any of the Departments of the Government knew anything about the Naval oil leases except the Departments of the Interior and the Navy, by which President Harding was kept advised in a general way. The mere fact that Fall, a Cabinet officer, was brought under the breath of suspicion, however, undoubtedly shook the faith of the people in government as a whole for the time being. To the extent that the Republican party was hurt, President Coolidge's chances of renomination and re-election were damaged, but it remains to be seen now, in view of the more recent evidence showing employment of ex-Democratic officials by oil interests, what offset in advantage the Republicans will get. Undoubtedly, William G. McAdoo's chances of securing the Democratic nomination have been jeopardized, notwithstanding the fact that Mr. McAdoo's employment took place after he left the Government, but before the Administration to which he belonged had left office. In the coming presidential campaign, the voters will undoubtedly be confronted with an avalanche of argument growing out of this investigation, in which both sides will endeavor to prove the other blacker than itself. If President Coolidge continues to handle the situation as firmly and adroitly as he has to date, however, and wipes the slate of his own administration clean, he is more likely to benefit than be hurt in the public mind.

TAXATION MUDDLE — Partisanship growing out of the oil controversy in the Senate not only has stiffened partisan lines in Congress, but it has resulted apparently in a complete breakdown of negotiations on the House side to bring about a compromise between the Democrats and Republicans on taxation legislation. The Democrats refused to discuss a compromise, unless the Republican members on the Committee on Ways and Means would first submit a concrete basis for negotiation. This the Republicans refused to do, and countered with a proposal by Chairman Greene that tax reduction begin at once instead of next year, with a reduction of 25 per cent in all income taxes. This move anticipated a similar bit of strategy by the Democrats, who became politically infuriated. When hope of compromise on a maximum surtax basis of 35 per cent failed, the majority Republicans on the Ways and Means Committee, by a vote of 11 to 3, decided to stand by the Mellon Plan of tax reduction, with such amendments as had been previously adopted by the Committee, to go onto the floor of the House with it, and force a compromise on it in the open, if possible. In the meantime, the Democrats have elected to stand by the Garner Bill, but until the Democrats caucus on that measure and make it a party bill, the door to compromise will still be open. Representative Frear, of Wisconsin, speaking for the LaFollette group, has announced that they will not support the Mellon Plan, but he has also carefully refrained from stating what plan, if any, he will support. The net result of the situation is that unless there is another shift in scenery, the Republicans will report their bill to the House some time this month and a debate unlimited as to time and as to the number of amendments which can be offered, will ensue. Common sense points to an eventual compromise of some kind, but common politics points to a first-class row as long as the public will stand for it.

Reynolds Heads New I. M. A. Committee on Legislation

C. F. Reynolds, President of the Pontiac Shoe Manufacturing Company, Pontiac, Ill., has been appointed Chairman of the Legislative Committee of the Illinois Manufacturers' Association by President E. C. Heidrich, Jr. Mr. Reynolds suggests, as a preliminary step to consideration of the important subjects that will be taken up by the 1925 session of the Illinois General Assembly, that each manufacturer acquaint himself with the policies of the members of the Legislature in his district, and endeavor to get into early touch with him so he may obtain the viewpoint of industry on matters to come before that session

Tremendous Business Done by the Chicago Post Office

The income of the Chicago Post Office for the calendar year 1923 was $51,506,651.81, showing an increase over the previous calendar year of $5,036,346.82, or 10.3 per cent, according to the report of Arthur E. Lueder, Postmaster at Chicago. This is just somewhat less than 10 per cent of the postal receipts of the United States. The mail originating in Chicago during the year noted, as to classes, is as follows:

First class	1.298.962.004	pi
Second class	536.219.000	”
Third class and paper mail..	523.924.800	”
Parcel post	260.892.480	”
Special Delivery	7.036.743	”

In addition to the above, about 15,000,000 pieces of registered mail were handled and approximately 500.000,000 pieces of ordinary mail received for delivery in Chicago for outside points. The Chicago office handles more domestic money orders than any other city in the world: nearly one-fourth of all the domestic orders in this country. Its business for the calendar year of 1923 was as follows:

	Number of Transactions	Amount
Domestic paid	38.676.549	$244.383.107.23
Domestic issued	3.533.103	36.800.970.61

The number of foreign money orders issued was 76,491 for $1,484,867.44. The number of foreign money orders paid was 22,840 for $278,743.36. The number of insured parcels originating in Chicago was 6,888,449, and the number of C. O. D. parcels was 8,149,360.

During the recent Christmas rush there were handled, on the heaviest day of that period, 7,400,000 letters for outward dispatch and 5,400,000 received for delivery in Chicago. On the same day 1,965 tons of parcel post were handled. The greatest sale of stamps and stamped paper for one day—$263,000—broke all previous records. The greatest amount of stamps and stamped paper previously sold for one day was $215,000.

Contractors, In Convention, Elect Officers for Year

The Associated General Contractors of America, meeting recently in Chicago in national convention, elected the following officers for 1924:

President — Frederick L. Cranford, Brooklyn, N. Y.

Vice-President at Large—A. S. Downey, Seattle, Wash.

Vice-Presidents — Leonard C. Wason, Boston and H. H. Wilson, Harrisburg, Pa.

Directors—W. A. Rowan, New York City; T. J. Baker, Milwaukee, Wis.; Henry Ericsson, Chicago; Natt MacDougal, Portland, Ore.; H. W. Baum, Salt Lake City, Utah.

Mr. Cranford succeeds John W. Cowper of Buffalo as President. The vice-presidents and directors hold office until 192

Link-Belt Cuts Price

Due to increased and more efficient production, the "Cub" portable loader, manufactured by the Link-Belt Company at its Philadelphia plant, has been reduced in price over 16 per cent. The machine formerly sold for $700, but placing it on the new manufacturing basis has steadily decreased the price—first to $585, then to $550 and now to $485.

"True Costs" Essential to Success

Management Is Dependent on Accounting Department, Which Studies and Analyzes All Business Problems

II.

By **WARREN H. SAPP**
In Charge of Plant Accounting,
Armour & Company

THIS is the second and final installment of Mr. Sapp's recent address before the Southern Division of the Illinois Manufacturers' Costs Association on "The Necessity of True Costs for Successful Management."

THERE are a number of industries presented with the problem of determining costs by the major and by-products systems. This includes such dustries as the production of many farm roducts, gas, coke, etc., by gas plants, e petroleum industry and the cattle busiess in the packing industry. The costs major products are usually computed y starting with the cost of the materials ed, to which are added the costs and exenses incurred, making the total outlay, educting therefrom the value of the byoducts produced, and the balance is the st of the major or prime product. ecause of variations in values, it is impracticable to attempt to find the costs of e by-products and as they are not asrtainable, the cost of the major product ould not be ascertainable except by deucting from the total outlay the full alue of the by-products produced.

In the cattle division of the packing dustry, with which I am quite familiar, can best illustrate the matter by citing e live steer which is purchased at so much er pound. It would be highly improper consider that each portion of that steer, hen the carcass is cut up, has a value ased on the live cost per pound. Experience has demonstrated that the loin, hich represents only one-tenth of the eight of the live animal, brings in about 0 per cent of the revenue. A chuck, hich weighs approximately the same, rings only 11 per cent of the revenue. onsequently, there would be no justice figuring that the loin is a big profit mak, whereas the chuck is a loss producer. he truth is that one is worth a great deal ore than the other, and bearing that in ind, we must conclude that we paid more er pound for the loin than we did for the uck. The practice in our industry, erefore, is to determine the cost of these arious products on a basis of the ruling arket price.

It is essential, in figuring the cost of ajor products, that the full value of byroducts be credited. By full value is eant the marketable value of such byroducts in their first commercial stage, ss any costs and expenses to be incurred processing them to such stages, and in arketing them. If an arbitrary or diferent valuation were used, the cost of e major product would not be deterined correctly.

Joint costs constitute the disintregation f something of known cost into several r many parts, none of which may be rmed major products. Being joint prodcts, it is impossible to figure the cost of each separately, though the cost of the whole group might be readily computed. It is almost always impracticable to apply an average cost to all of the various products, for the reason that usually some are high-grade and are of relatively high value, while others are of medium or lower grades with relatively lower values. An average cost would, therefore, be entirely misleading.

It is necessary, therefore, to apply values to the joint products based upon their market values, comparing the total value of the production as against the cost of the materials, plus expenses that make the total outlay, and a margin of profit or loss between the total costs and the total value of the products made. The problem of joint costs is found in several industries such as the sorting and grading of tobacco, the glue business, cottonseed oil business and the hog business in the packing industry.

Virtually all businesses come under one or more of these classifications, and I do not know that there is much to be said on this subject other than that each business has its own peculiar problems and the cost system must be made to fit the business, the most essential feature being, irrespective of which system, a true reflection of costs.

Supplies Are Same As Cash

In considering turnover, which, as a rule, is featured from a sales standpoint, do not overlook the possibilities for the reduction in expenses from an interest standpoint on moneys tied up in stocks of raw materials and supplies in the various departments of the factory in excess of the normal requirements to carry on the business. Dollars tied up in this fashion are idle and of just as great importance as the Cashier's Department carrying thousands of dollars in excess of the requirements in the cash drawer—something that would not be tolerated for a moment. Quite frequently the proper attention is not given to stocks of materials and supplies just because they happen to be out in the factory accessible to the workmen, but remember that a dollar's worth of supplies carries just the same value as a dollar in the cash drawer, and should be considered accordingly.

No business of any magnitude could be operated successfully for any great length of time without a close and detailed check upon operations. The management must have statistics that reflect actual operations. Without them no manager could control the operating costs of certain articles, which might reach the inefficient stage. To furnish these statistics it is absolutely necessary to have the accounting organization. The accounting unit, in the case of factory operation, is vitally essential to the successful conduct of business since it reflects accurately the costs, the yields, and the profits and losses to the management.

I should like to draw your attention to the method of analyzing results, particularly from an operating standpoint, from the angle of profit or loss controllable by management. Quite frequently, due to a fluctuation in volume, the net profit or loss unit of production shows to advantage or disadvantage, and unless you are quoting your executive a result per unit on controllable items, the executive is very apt to misjudge the efficiency of men actually in charge of operation and sales. The factory man directly responsible for operating costs may conduct his end of the business just as efficiently during a period of low production as he did during periods of greater production by watching every angle of the business closely, laying off help commensurate with the loss in volume, thereby keeping his unit cost for direct expenses on a comparable basis, but when the fixed overhead expense is applied in order to show the net profit or loss, the realization based upon production does not show up so favorably. A controllable result is the profit or loss on expenditures that are within the control of management, which embrace such major items as materials, supplies, labor, salaries and fuel. The major portion of these costs fluctuate with production and are almost wholly within the control of management. Of course, in the case of labor there are certain numbers of steady time employes—such as foremen and assistants and office help—that do not fluctuate with volume. I consider this one of the most important features in connection with the reporting of operating results to the executives from the standpoint of reflecting the real efficiency of management during periods of slack production. The operating division certainly should not be criticized for high costs when they are due wholly to the effect of the factory overhead because of light production.

Operating men are specialists—so are sales managers. They study, as a rule, in an intensive way, only one end of the business. Their aim is to become proficient in their particular line. Each has his own individual problems, but the accountant must ever give thought and analysis to the problems of all and must necessarily keep in closer touch with the general business rather than view it from just one angle.

Be A Factor in the Business

To the accountants present I should like to stress the importance not only of applying one's self and time toward the attainment of special or pertinent knowledge of their businesses, but also as much knowledge as possible of the general operations. In other words, the development of the mind as much as possible and the application of the knowledge thus obtained in the daily intercourse one has with his executives. There is too little of this these days—there always has been—but this is certain: It is more essential to use the brain as a productive machine than as a filing cabinet. It is very easy to conduct post-mortems, but it is inestimably more important to be a daily factor in the running of a business.

Too often, perhaps, one hesitates to stray outside the beaten path and in so doing he is very likely to overlook opportunities that may present themselves because of their not being strictly identified as his responsibility, yet which are accessible to him because of his being able to study and visualize the entire business from an unbiased angle. In this connection there occurs to me an opportunity that opens off of the beaten path for an accountant in almost every large industry.

In business, admittedly, some laborers and skilled workers are more productive than others, yet because of custom, those men are paid only at the same rate as that class of men which is less efficient. Obviously, it is not practicable to sift out the more efficient men and pay them more per hour. Such a plan would depend upon the sagacity of the Superintendent, and, in the end, it would be certain to produce dissatisfaction among the workers.

The solution of the problem is the establishment of a standard of production per man in some manner equal to a quantity per man commensurate with the wages now in effect, and then a premium schedule could be adopted that would provide for the division of savings between the employer and employe based upon the production of goods over standard by the employe or group of employes. Naturally, such a plan would have to be based upon the going rate for a normal output. That system would adjust wages upon the efforts of the individual directly concerned, and it would remove the opportunity for complaint because the less efficient worker is given an equal opportunity to swell his wages through added personal efforts. Certainly this is a subject to which an accountant may apply himself and by so doing place in the management's hands a tool that might be extremely valuable to his employers.

In conclusion, let us not overlook this fact—management must provide for the general welfare of the business—it must meet competitive conditions—it must produce its product on a basis that will give a fair return on the money invested in the business,—it must establish policies that will effectively perpetuate the business. In order to carry out this program, management is fully dependent upon the Accounting Department to properly guide its course and the Accounting Department can only perform this function through the medium of true costs.

Associated Employers of Indianapolis Hold Election

New directors of the Associated Employers of Indianapolis, Inc., for a term of three years, have been elected as follows:

Samuel O. Dungan, Polk Sanitary Milk Co.; E. J. O'Reilly, Thos. Madden Son & Co.; Henry L. Dithmer, Polar Ice & Fuel Co.; Fred C. Gardner, E. C. Atkins & Co.; Alfred Kauffmann, Link-Belt Co.; A. L. Taggart, Taggart Baking Co.; A. G. Ruddell, Central Rubber & Supply Co.; Blaine H. Miller, American Foundry Co.

Mellon Plan Means Real Tax Relief

Most Comprehensive and Constructive Solution Yet Offered—Hits Wealthy Investors in Tax-Free Bonds

II.

By J. FRANK ZOLLER
Tax Attorney, General Electric Co.,
Schenectady, N. Y.

THIS is the second and concluding installment of Judge Zoller's address before the recent National Farmer-Manufacturer Convention held in Chicago under the auspices of the Illinois Manufacturers' Association on the subject of "The Country's Taxes.

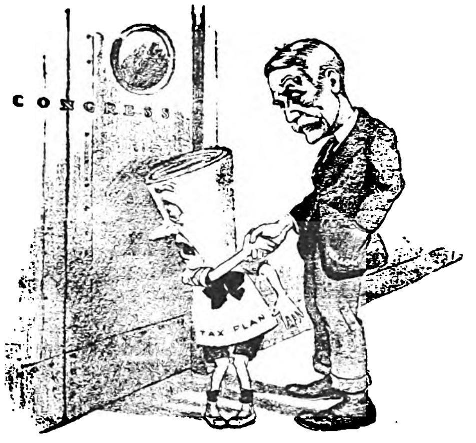
UNDER the Mellon Plan it is proposed that the normal rate paid by individuals shall not exceed 6 per cent and that the surtax rate shall not exceed per cent, making the maximum on all omes, with the exception of dividends, per cent instead of 58 per cent, and in pect to dividends 37½ per cent instead 62½ per cent. It should be borne in ıd that, notwithstanding the Mellon duction Tax Plan, the maximum tax l stands either at 31 per cent or 37½ cent instead of 58 per cent and 62½ cent.

Some individuals in Congress and elseere, who would tax the rich to the maxim, are opposed to this reduction of the her brackets in the existing law. If those lividuals would carefully study the sition they would come to the inevitable ıclusion that the proposal of the Honıble Secretary actually means practicalno reduction in the taxes of those rich lividuals that are now subject to the ximum rates. The reason is that very v of the individuals subject to the maxiım rates are being taxed at all by the leral Government, with the result that taxes are actually borne by individuals smaller means.

For example: In 1916 there were 1,296 rsons in the United States who, on their ome tax returns, showed that they were eiving a taxable net income of $300,000 more per year. The total income of se 1,296 persons was approximately $1,0,000,000 that year. By analysis made the Treasury Department it was found ıt of the $1,000,000,000, $706,000,000 me from individuals on stock and interon investments generally. In 1916, it ould be recalled, the maximum surtax te on incomes exceeding $300,000 was per cent and the normal rate 2 per cent, aking the total rate on such incomes ıount to 15 per cent. Under such rates se 1,296 persons could afford to pay tax, and the facts show that they did y it. In 1918, the number of persons porting incomes in excess of $300,000 opped to 627 and finally in 1921 only 6 persons were in the group of incomes $300,000 or over.

In other words, there were 1,296 paying es on incomes of $300,000 or more per ar in 1916 when the rate did not exceed per cent, and in 1921 when the rate was per cent only 246 such individuals could induced to pay the tax.

What happened? Everyone knows that number of individuals having incomes $300,000 or over materially increased m 1916 to 1921. The number of taxpayers that paid the tax, however, decreased from 1,296 to 246. What happened was that practically all of such individuals with the larger incomes avoided the tax and the Government, instead of getting many times their revenue by increasing the rate many times, actually received less tax from such taxpayers under the high rates of 1921 than under the lower rates of 1916.



N. Y. Times

Tax Plan to Secretary Mellon—"Good-bye Papa—I hope you'll know me when I come out"

There are various ways by which the high surtaxes may be avoided:

(a) By splitting up large estates among members of a family so that the sum total paid in taxes by all members is less than would be paid if the income was received by only one member of the family.

(b) By creating trusts, which is but another means of dividing large estates into a number of smaller estates, but with the proviso in many cases, as a part of the Trust Agreement, that the different trust estates created shall at some distant time in the future (when it is hoped that the rates of taxation will be reduced) revert to the original grantor.

(c) By forming corporations, which are merely family affairs and permitting the gains to accumulate instead of having them divided among the stockholders. Corporations are not subject to surtaxes, but there is a provision in the Income Tax Law (Section 220) which provides that in case a corporation accumulates income in excess of the needs of the business for the purpose of avoiding surtaxes, it shall pay an additional tax of 25 per cent upon the total net income for the year. This penalty for failure to distribute income upon the part of the corporation is, in many cases, much less than would be paid in surtaxes if the income were distributed to the stockholders. More than this, it is difficult to establish what the needs of the business are in many cases, so that failure to distribute does not always result in an additional tax.

(d) By investing in securities the income from which is not subject to the Federal income tax. The last mentioned arrangement for avoiding surtaxes is probably indulged in by wealthy individuals to a much greater extent than any other.

Tax Exempt Securities

Under an implied provision of the Federal Constitution, income received on securities issued by the different states and their political subdivisions is not subject to taxation upon the part of the Federal Government. This means that if a taxpayer had all his property invested in state or municipal bonds and received no income from any other source, he would pay no income taxes whatever to the Federal Government. The theory upon which the income from such securities is exempted is that to permit the Federal Government to tax the income from state or municipal bonds would interfere with the borrowing of money by such institutions and for that reason would constitute an interference with the functions of state governments. The various state governments have no power to tax the income received on United States securities. The corollary of that proposition is that the Federal Government likewise has no power to tax the income on securities issued by the various states or their political subdivisions.

In taxation, as well as in business, the law of diminishing returns applies. Every business man knows that in any business, if he makes the price of his product too high, his return from his business will be diminished. The same thing is true in respect to taxation. If the tax rate is too high the return to the Government in revenues will be diminished rather than increased. That has actually happened in respect to our Federal taxes. We have gone beyond the point of the greatest return to the Government in fixing the higher tax rates. The result has been less rather than more revenue. The purpose of the Honorable Secretary of the Treasury, therefore, is not to relieve the rich from taxes but to fix the high surtax rate at a point where the tax will produce more revenue from these wealthy individuals.

Let us analyze the proposition of the Honorable Secretary of the Treasury and decide whether or not this is so. Suppose a certain individual has a net income in excess of $300,000 per year so that any additional income that he might receive would be subject to a surtax at the rate of 50 per cent, or in other words, the Government would take one-half of it for surtaxes alone, saying nothing about the normal tax at the rate of 8 per cent. If this individual invests in the bonds or stocks of private corporations and the return on the investment is 8 per cent, it means that the taxpayer will realize less than 4 per cent on the investment because the balance of the return must be paid in taxes to the Federal Government. If he invests in a bond issued by some state or city, for example, even though the rate is only 5 per cent, he will pay no taxes whatever upon the income from such investments and will realize 5 per cent thereon, or more than 1 per cent in excess of the return on his 8 per cent security. If the surtax rate were 25 per cent instead of 50 per cent he would, in this case, pay a tax on the business security of about one-fourth of 8 per cent or about 2 per cent, which would mean a realization on the 8 per cent investment of about 6 per cent, which would be better than the investment in the state or municipal bond yielding a return of 5 per cent. It, therefore, doubtless is true under present conditions that a reduction in the present surtax rate absolutely would mean more revenue to the Government, because of less capital being invested in non-taxable securities.

The fact that state and municipal securities are exempt from Federal taxation has created an abnormal demand for such securities upon the part of taxpayers subject to high surtax rates. In 1913 the total indebtedness of all states and cities in the United States was about $1,500,000,000; in 1922 it had increased to approximately $9,000,000,000, or about twice what it was in 1913. Under the 1913 law the surtax rates did not exceed 6 per cent. Under the 1916 law they were increased so that the highest surtax rate was 13 per cent; by the Act of Oct. 3, 1917, the surtax rate still did not exceed 13 per cent; by the Income Tax Act of 1918 they were increased to the maximum rate of 65 per cent. These rates were reduced by the Revenue Act of 1921, so that today the maximum surtax rate is 50 per cent.

Tax Rates Boost State Debts

There probably is no doubt that the material increase in the surtax rates has had a great deal to do in increasing the indebtedness of the states and cities since 1913. There is now great demand for state and city bonds upon the part of taxpayers subject to high surtax rates. This, undoubtedly, has resulted in extravagance upon the part of states and cities, because it has been so easy to sell their non-taxable securities. Many improvements have undoubtedly been undertaken by cities through the sale of these non-taxable securities which the city could not afford. A story is told of a certain city in the South that desired to have the railroad which ran into the city build a very beautiful, picturesque and expensive railroad station. A committee was appointed which conferred with the representatives of the Railroad Company. The Railroad Company very frankly stated it did not have the money with which to build that kind of station, that it could not get the money and could not afford to build so expensive a structure if it would get the capital. The city thereupon issued non-taxable securities, secured the money from the public, erected the structure and then leased it to the Railroad Company for ninety-nine years. In this way the city was, in effect, able to reduce the revenue of the Federal Government, because if this station had been built by the Railroad Company the income from the securities sold to pay for it would have been subject to the Federal tax. The income from the securities sold by the city, used for the same purpose, was subject to no tax.

The ability to issue non-taxable securities upon the part of municipalities tends to drive the country toward municipal ownership and operation, the Government being able to finance business enterprises by the sale of tax-free securities while private concerns must rely upon the sale of taxable securities.

Not only does the issue of non-taxable securities result in extravagance upon the part of municipalities but it also results in very bad financing—that of paying current expenses by means of a bond issue. It is a fundamental principle of finance that no institution should go into debt for the purpose of paying current expenses; that to go into debt to pay current expenses means living beyond one's means. Yet we are told that a certain state has issued 50-year bonds, the proceeds of which are to be used in building state roads. When such bonds become due the roads will have long before passed out of existence, with the result that the bonds will have to be paid by the generation that did not enjoy any part of the improvement, which results in permitting one generation to live beyond its means at the expense of a future generation.

Another detrimental effect of the issue of non-taxable securities is that it diverts capital from business into non-productive enterprise. Governments, as a whole, are usually engaged in non-productive enterprises, because the thing obtained for the money spent does not, as a general proposition, add to the wealth of the community. If something were produced by the government that would naturally add to the wealth of the community, the wealth of the community might still be reduced, instead of being increased, for the reason that through inefficiency in production as compared with private enterprise, the cost might easily exceed the value of the thing produced.

As compared with private enterprise it probably can be said that, as a practical matter, governments are usually engaged in non-productive enterprise. Almost any amount of money today can be raised to build a public theater, hall, park or some other picturesque or ornamental acquisition, although it may be very difficult to secure funds to finance legitimate business. The issue of non-taxable securities, therefore, means that not only does the government lose the revenues, but legitimate business loses the capital. This situation, of course, prevents the development of our resources for the benefit of all the people. It is an economic principle that capital used in non-productive enterprise does not result in more than half the good to all the people that results when capital is invested in productive enterprise.

Therefore, in considering the present Tax Act, a part of the problem is to determine what can be done to avoid an abnormal amount of capital being invested in non-taxable securities.

Interest on Debts Deducted

In addition to this reduction of the higher surtax rates, the Honorable Secretary of the Treasury has made another suggestion in an attempt to avoid evasion of the tax by wealthy persons. Under the present law not only is the income from state and municipal securities exempt from any tax whatever, but in addition thereto all interest paid in by the taxpayer on borrowed money and all losses in connection with any transaction entered into for profit may be deducted in determining the taxable net income. This results under the present law in permitting the taxpayer to reduce this taxable net income on account of interest paid on borrowed money which may have been used for the purpose of buying non-taxable securities.

There is a case on record in the Treasury Department where a certain taxpayer owned about $30,000,000 of securities, the income from which was exempt from tax. In addition to this he had about $40,000,000 of securities, the income from which was subject to the tax. His interest payment, however, on borrowed money was sufficient to offset the taxable income. The result was that, notwithstanding the fact that this particular taxpayer owned about $70,000,000 of securities, the income from more than half of which was subject to the tax, he did not pay any tax whatever to the Government because of the interest deduction and the exemption afforded the income from his state and municipal securities.

Mr. Mellon proposes in his Plan that hereafter the interest deduction, and the deduction of such losses of the taxpayer, shall be limited to the income received from non-taxable securities, requiring the taxpayer to apply the interest and loss deduction against his non-taxable income instead of against his taxable income, so that wealthy taxpayers shall not hereafter have the benefit of both non-taxable income and loss and interest deductions from taxable income. This provision, as a practical matter, will only apply to those tax-

Factors Affecting "Plant Location"

Site Selection Is Vital In Considering Future Business Development—Manufacturing Requirements Important

II.

By HAROLD T. MOORE

Industrial Engineer With Day & Zimmermann, Inc.

INDUSTRIES which have a large power demand must be able to purchase relatively cheap power or obtain fuel at reasonably low cost. Chemal and other industries which operate lectric furnaces and require current in rge quantities have located around Nigara Falls to obtain the wholesale rates or electric power. The long distance ansmission of high voltage current now nables industries to locate remote from entral stations and still obtain economical ower.

The establishing of super-power plants at favorable locations and carrying the current instead of the coal to consuming centers has already been accomplished in certain districts and offers greater possibilities for the future. In keeping with modern mountain-climbing practice, the Pennsylvania Railroad recently announced that the famous "Horse-shoe Curve" over the Alleghenies will soon be equipped for the use of electric locomotives.

MANUFACTURING REQUIREMENTS—Special needs or objectionable features in the manufacturing process may be a determining factor in site selection. Large power plants with a surplus of exhaust steam require a dependable and satisfactory water supply for condensing purposes or must resort to artificial cooling of the circulating water. Noisy hammer shops, fertilizer and glue factories, stock yards, dust-producing plants, etc., are not popular near residential districts and run the risk of condemnation as a public nuisance.

S.—Chicago; 3—Foundry and machine shop; iron and steel works and rolling mills—Pittsburgh; 4-Lumber and timber—State of Washington; 5—Flour—Minneapolis; 6—Cotton goods—Fall River; jewelry—Providence; 7—Boots and shoes; woolen, worsted and felt goods—Massachusetts; 8—Car building shops—Berwick, Pa.; 9—Manufacturing center of the U. S.; 10—Breweries—St. Louis; 11—Carriages and wagons—South Bend; 12—Furniture—Grand Rapids; 13—Silk—Paterson, N. J.

TRANSPORTATION

Capital Expenditures by Class I Railroads in 1923 Largest In History, Amounting to Total of $1,075,897,940

CAPITAL expenditures made by Class I railroads of the United States in 1923, for equipment and other facilities to meet the increased demand for transportation, were the greatest for any similar period in the history of railroading in this country, according to a statement issued by the American Railway Association, which says further:

"One result of these enormous expenditures was that the railroads in 1923 handled without transportation difficulties the greatest freight traffic on record. In nine out of twelve months there was an average of a million cars loaded weekly with revenue freight. The million mark has been reached only in five separate weeks in previous years, all of which took place in the late Summer and early Fall of 1920.

"Capital expenditures actually made in 1923 for the purchase of equipment and other facilities totaled $1,075,897,940, while unexpended authorizations made during the current year but which will be carried over into 1924 totaled $300,806,519.

"Of the total expenditures made in 1923, $690,857,266 was for equipment, while $385,040,674 was for roadway and structures, which includes additional track, heavier rail, additional ballast, shops and engine houses, and other improvements.

"Actual expenditures for locomotives in 1923 amounted to $212,225,204; for freight cars, $415,923,534, and passenger cars $49,791,516. For other rolling stock and floating equipment the expenditures totaled $12,917,012.

"Class I carriers also spent $116,215,710 for additional track and track material during the year, and $27,106,021 for heavier rail. Additional ballast cost $10,015,601, while expenditures for shops and engine houses, including machinery and tools, totaled $48,787,828. For other improvements not heretofore enumerated, $182,915,514 was expended.

"Of the $300,806,519 unexpended authorizations which were carried over into 1924, $89,828,105 was for equipment. This latter amount includes a carry-over for locomotives of $20,665,383; for freight cars, $50,006,942, and for passenger cars, $14,793,182.

"Unexpended authorizations for roadway and structures carried over into 1924 total $210,978,414, which includes $64,843,315 for additional track and track material; $19,169,551 for shops and engine houses; $4,132,463 for heavier rail, and $4,109,155 for additional ballast. The carry-over for other improvements amounted to $118,723,930."

Read This--Then Locate Your Factory In Canton, Illinois

Alert business men who are on the lookout for an ideal factory site, read these facts about Canton, Illinois, sponsored by the Canton Community Club, an organization ready and willing to lend every assistance in bringing your factory to this thriving city of 12,000-forty miles south of Galesburg on the main line of the C. B. & Q. and thirty miles west of Peoria on the T. P. & W. railway, connected by electric line, carrying freight and passengers to the M. & St. L., ten miles distant. Shipping facilities, you'll agree, are excellent.

An abundance of water, gas and electricity are available at very low rates. Coal is mined right here at home, furnishing cheap fuel.

Eleven modern, well-equipped school buildings, including fine high and parochial schools. The city library is worthy of special mention. Nearly every church denomination is represented.

Canton has three banks, with combined deposits of nearly $5,000,000.00. Two thriving Building and Loan Associations, with over $1,000,000.00 in assets, which enables the wage-earner to own his home.

Canton is the home of the largest plow works in the country which meets no obstacles,—labor, power or transportation, in carrying on its great industrial operations.

May we tell you more about Canton's consideration for the firm searching a suitable site to build a factory? Splendid inducements await you here. Write for detailed information. Don't decide until acquainted with us.

The Cost of Poor Packing

Losses from robbery averaged 7.1 per cent of all freight claim payments by American railways during the first half of 1923, as reported by the American Railway Association. The ratio of one railroad was over 50 per cent, and the total losses of the principal roads on account of robbery reached $1,620,800. This is a heavy burden on commerce, which can be materially reduced by the whole-hearted co-operation of shippers. Three things must be done: (1) Better and stronger containers used; (2) iron strapping provided on each package; (3) markings made legibly with indelible ink.

Cunard Carries Many Voyagers

According to a statement from the Cunard Line, immigration and tourist statistics, just given out, show the Cunard-Anchor Company to have carried the largest number of trans-Atlantic passengers during the year 1923. The number carried by the Cunard Line, the Anchor Line and the Anchor-Donaldson Line, both Eastbound and Westbound in the North Atlantic service, totals 225,642. This amounts to 23 per cent of all the passengers carried and is several thousand higher than the next nearest group of lines. During 1923 a total of 976,875 passengers were carried by more than twenty different lines in the North Atlantic service, and according to the statistics furnished by the Atlantic Conference the Cunard Line carried almost one-fourth of all these ocean voyagers during the year.

Comparison of Wages

The average annual compensation of Santa Fe System employes, including officers, was in 1915, $856, and excluding officers, $832, and in 1922, $1,552 including officers, and $1,519 excluding officers. If the compensation of officers be included, the annual increase is $900 or 81.3 per cent, and if excluded, $687, or 82.7 per cent, according to a statement issued by President W. B. Storey.

The average annual compensation of general officers increased from $5,479, in 1915, to $6,166 in 1922, or 12.5 per cent, and of division and subordinate officers from $2,212, in 1915, to $3,953, in 1922, or 78.7 per cent.

The Department of Labor has for many years compiled a periodical and annual cost of living statement showing increases and decreases. These computations, which are reliable, show that the increase in cost of living in 1922 over 1915 was 62.5 per cent. Comparing increase in annual compensation of employes and in cost of living in 1922, with 1915, we have the following increases:

In annual compensation	81.3 per cent
In cost of living	62.5 per cent

Freight Through "Soo" Canal

The movement of freight through the Sault Ste. Marie canals for the 1923 season aggregated 91,379,658 short tons, only 508,561 short tons below the all-time record of 1916, according to an announcement by the United States Engineer at that point.

Mellon Plan Means Real Tax Relief for the Public

(*Continued from page 12*)

ayers having large incomes and is a decided disadvantage to the rich.

The Mellon Plan is comprehensive, onstructive and based upon a careful consideration and estimate in respect to the whole situation. No other plan as sound s it, so far as general relief from the present burden is concerned, has been put forward or is likely to be put forward in time or accomplishment during the present session. It, therefore, is probably the best plan that the taxpayers of this country can hope to get.

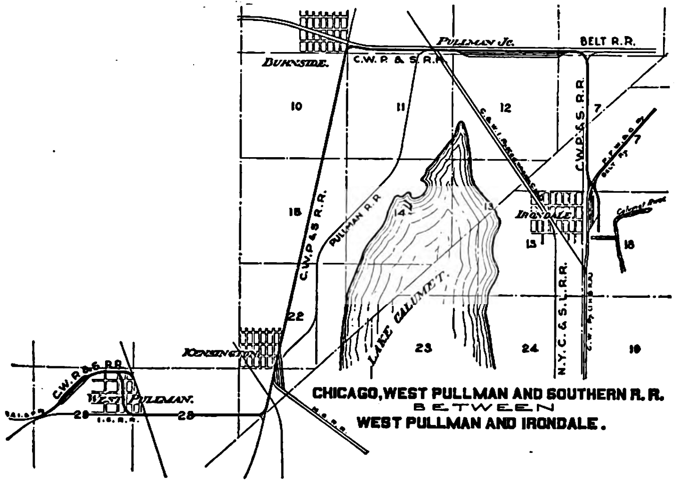
It is of the utmost importance that taxes be reduced at this time because we now have a surplus. A surplus in the hands of the Government is a dangerous thing, because unless it is wiped out by tax reduction it will be wiped out by spending the money, leaving the tax burden where it is. As a practical matter, it is almost mpossible to get tax reduction when there s no surplus. It is, therefore, of the utmost importance to the people of this country to act upon tax reduction now. The only sure way to get tax reduction now is to act upon the only comprehensive plan that has been put forward with that end in view. The adoption of the Mellon Plan means tax reduction now and relief for all the people from the burden of war taxation. To delay the adoption of it means a continuation of the present burden and possibly a loss, for years to come, of the opportunity to get relief at all.

The question is sometimes asked, "Why should an individual who pays no income tax at all, be interested in tax reduction?" Of course, any person that pays any income tax at all under the present law is interested in the Mellon Plan because his taxes are absolutely reduced thereunder, whether his income be large or small. In the first place, the normal tax which is imposed upon all incomes—in the case of a single person in excess of $1,000 and in the case of married individuals without dependents in excess of $2,500—is reduced from 4 per cent to 3 per cent on the first $4,000 of taxable income and from 8 per cent to 6 per cent in the case of all taxable income in excess of $4,000.

In regard to those individuals who are not taxed directly, because their net incomes do not exceed the specific exemption, indirect benefits are derived from the fact that the cost of living is reduced because of the reduction of the tax; because business is stimulated to the general benefit of all; because more capital, as a result of the change in the law, is invested in productive enterprise instead of in tax-exempt securities. Fewer state, county and municipal bonds are issued to meet the demand for tax-exempt securities. It should be obvious to anyone that the increase in state, county and municipal bonds during the years of the excessive tax rates has resulted in increasing the local taxes paid by everyone, including the farmer.

It must be remembered that not only must the interest on these bonds be paid, but a sinking fund must be provided to meet the principles of these bonds when they become due. If the proposed Mellon Plan reduces the issue of these municipal securities, local taxes will be reduced in all the states. Therefore, whether a taxpayer pays income taxes directly or not, he should be interested in the proposed Mellon Plan because of the direct benefit due to the reductions of local taxes and the indirect benefits due to decreasing the cost of living and increasing all legitimate business activity.

Lastly, it should be stated that there should be no politics in any comprehensive tax reduction plan. The present Secretary of the Treasury happens to be a Republican. There is every reason to believe that substantially the same plan would be advocated by a Democrat with the same knowledge of finance and occupying the same position. This is manifest by the fact that Governor Smith of the great State of New York, who happens to be a Democrat, has advocated a reduction of 25 per cent in the rates of the present personal income tax now in force in that state. We, therefore, have a Republican in the one instance and a Democrat in the other, both advocating at this most opportune time relief from war taxes. It makes no difference what the politics of the particular individual may be who advocates tax reduction. As already stated, the most important thing is to get the tax reduced.



CHICAGO, WEST PULLMAN AND SOUTHERN R.R.
BETWEEN
WEST PULLMAN AND IRONDALE.

Manufacturing Locations for Sale

Along the line of the Chicago, West Pullman and Southern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad, the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound, with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Chicago, West Pullman and Southern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

FOREIGN TRADE

Proper Stenciling of Packages in Export Trade Is of Greatest Importance—Millions Lost by Bad Marking

PROPER and distinct marking is absolutely essential in export trade. However carefully an exporter may construct his containers and pack his merchandise within them, if the marking is illegible, easily rubbed off, or becomes blurred and unreadable through dampness or the rubbing to which a package is subjected on an ocean voyage, loss of goods or months of delay in receipt of the shipment, are most likely to result. Losses from improper and incorrect marking run into millions. Too much emphasis cannot be placed on correct marking, says the Transportation Division of the Department of Commerce.

The importance of care in this matter is plain when it is realized that in nearly every instance the foreign customer is subjected to fines, or perhaps the loss of his goods. Brazil in particular has promulgated regulations in regard to consecutive numbering,, and any departure from these is punishable by heavy fines. In Salvador, goods bearing duplicate numbers are considered contraband, and are liable to a fine of 2 per cent of the duties.

The stencil marking done by Americans is, generally speaking, too small. Even large cases are marked with one-inch stencils. Our competitors make a specialty of marks from three to five inches high, the consignees' mark and destination being legible at 200 yards. Stencils should be not less than two inches, and on large cases marks five inches high would not be too large.

In marking bales, marks should not be placed on the burlap itself, nor should tags tied to the bale be used. Some exporters stencil a piece of cotton or canvas with the necessary marks, and sew this to the bale. A better way is to mark a metal plate, fastened securely to the metal bands with which the bale is tied. The use of tags should be avoided, as they are easily torn from the package, or, perhaps, become defaced. If tags must be used, they should be of metal and securely wired to the package.

Consul from Singapore In Chicago

American Consul-General Ernest L. Harris from Singapore, Straits Settlements, was in Chicago Feb. 4 and 5, advising manufacturers in regard to the market for their products in the Straits Settlements and the Far East. Mr. Harris was formerly stationed in Europe.

Corn Husking Test in Argentine

The Argentine Department of Agriculture is organizing a corn harvesting and husking machinery contest to be held during the next corn season which will last from March to June, 1924. The contest is open to manufacturers, inventors, and importers of corn harvesting machinery, including all kinds of corn cutters, corn binders, and corn pickers and huskers.

U. S. Trade With Philippines

During the quarter of a century that the United States has owned the Philippine Islands the share of this country in the total trade of the archipelago has grown from 11 per cent in 1900 to 66 in 1920, the post war boom year in the islands' trade, 63 in 1922 and 65 per cent for the first ten months of 1923. At the same time, says the Far Eastern Division of the Department of Commerce, improved methods in the cultivation of native products to meet the demands of enlarged outlets and an increased desire for imported manufactured articles, brought about through civic development and improved standards of living, have contributed to a trade development participated in by Europe and Asia as well as the United States.

U. S. Oriental Trade Growing

A gain in our trade with the Orient in 1923, both in exports as well as imports, is shown by figures compiled by the Department of Commerce. Twenty-two per cent of our total trade was with the Far East in 1923 against 20 per cent in 1922. Our exports to the Orient increased from 14 per cent of our total exports in 1922 to 16 per cent in 1923, while our imports showed a gain of from 28 per cent to 29 per cent.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

ALGERIA—9050. labor-saving construction machines and tools.

AUSTRIA—9053, household appliances and devices: 9072. wheat, hard, Manitoba. Nos. 1 and 2, 12,000 tons per month.

AZORES—9016. sheeting, grey.

CANARY ISLANDS—9023, greases; lubricating oil; oil, gas, for Diesel engines; 9041. radiators. automobile. aluminum; 9052, supplies. appliances, and devices, electrical.

CEYLON—9055. pharmaceuticals. prepared medicines, tonics.

CHILE—9030, bricks. refractory.

CHINA—9028. boots; 9008, carbon black; 9028. cotton piece-goods. collars, crockery. clocks, glassware; 9013, glycerine, U. S. P.; 9028. hats, felt and straw, kitchenware, tin and aluminum. novelties; 9013, round-wire nails. countersunk; 9028, stationery; 9013. screws. flathead. wood; 9028. shoes; 9013. tinplate, 20x30 inches; 9028. ties. toys.

COLOMBIA—9067, gas furnaces. small. for melting and treating gold and silver.

CUBA—9051. yeast for Cuban bread.

DANZIG—9073. apricot kernels. bitter. fruits, dried.

ENGLAND—9057. general merchandise, leather. skins, tanning materials.

FRANCE—9037. electrical devices. electric fans, electric heating devices, gas heaters. locks: 9006. salmon. frozen.

GERMANY—9002, emery, carborundum linen; 8897. sweatbands for hats.

HONDURAS—9054. beans. pink. 500 to 1,000 sacks per shipment.

INDIA—9069, cutlery, fancy goods. hosiery: 9047, looms and warping. finishing and winding machines; 9069. stationery. toilet articles, toys.

ITALY—9060. grocery specialties; 9068. wheat.

JAPAN—9049. fully refined white paraffine for candles, wax, match, 30 tons.

JAVA—9059, bicycles.

NEW ZEALAND—9005. laundry equipment; 9029. hardwoods. northern and southern; 9005, refrigerators. domestic and store; 9005, washing machines.

PANAMA—9047. acids for cleaning backs of mother-of-pearl shells. machinery for manufacturing buttons from mother-of-pearl shells.

PORTUGAL—9017. yarns, cotton.

SOUTH AFRICA—9059. automobile accessories; 9009. boots: 9045. bathroom fixtures; 9009, canned goods; 9015. cartons. paper unleakable; 9009. hardware; 9059. motorcycles; 9015. machinery for making paper cartons; 9064. novelty lines. low-priced; 9025. organs. small. home: 9027. paper. stationery, printers' supplies. printing machinery; 9039. parts for radio sets: radio receiving sets. radio transmitting sets; 9009. shoes; 9062. suits. men's light weight: 9045. sanitary ware; 9059. tires. automobile and bicycle: 9009. tools.

SPAIN 9014. machinery for tin box making and printing in relief.

SWEDEN—9019. ship ropes, twines.

SWITZERLAND—9034. oak. red and white: 9049. sheepskins. 500. for lining wooden shoes.

TURKEY—9012. wheat.

VENEZUELA—9020. bungalows. sectional. knocked down.

Are You "Behind the Times"?

Not many years ago your grandfather reaped his crops—picked his cotton — dug canals and loaded his ships by hand. He also shoveled coal on his fire and hauled out ashes.

Today — you have advanced. You have machinery to do the work your grandfather did by hand. But—do you still shovel coal and haul out ashes? In Chicago today—Manufacturers are keeping abreast of the tide of industrial advancement and *improving* their products, simply because they know that—

If it's done with heat—

SALES MANAGEMENT

SOMETIME ago the Chicago Sales Manager's Association was engaged in a discussion as to whether enthusiasm or plain, hard, statistical facts created the better salesmanship among salesmen. Many arguments were advanced on each side, but at the conclusion of the talk Mr. V. Frank Banta recapitulated the statements by both affirmative and negative, showing that enthusiasm and careful planning, backed by statistics, are complements of each other. In his summing up of the discussion, Mr. Benta made the following statements, which should be of interest to executives as well as salesmen in general.—Editor's Note.

I DON'T believe there is a sales manager who would operate an organization without definite records; definite planning and definite control of his salesmen. You lay out a territory, and how do you determine how many salesmen you are going to put into it? That territory must produce just so much volume for you, and unless you definitely plan that work and definitely analyze that territory, you can turn a hundred men loose, fired with enthusiasm, and it will die on you, unless you give your men something to work to, in dollars and cents, in sales quota, in definite, tangible, workable information.

You must plan the work of the salesman. I don't mean that the Sales Manager should sit down and spend hours of his time each day or week compiling statistics. He can hire all the clerks he wants for that. He does not work it out himself. An executive in any organization, be he sales manager or otherwise, relies upon his plans and details to be furnished by subordinates, but he must be an executive and he must be able to use those plans and details in guiding his men and in guiding the policies of his company, and that is all done through careful planning and careful scheduling. You don't guess at it. You must bring it to the salesmen in such a manner that he can utilize it; not on a twenty-four by thirty-six sheet; not making a man report every time he says "yes" or "no." That is not real planning and scheduling. It is foolishness for some men to call that a sales report.

The real sales manager does not demand that, but the real sales manager does demand a careful analysis and planning for his men, and a careful attention to details relating to his territory, and he bases every sales quota upon definite knowledge of that territory. He lays every plan that he formulates, if it is worthy of being called a plan, upon definite knowledge of territory. If he does not do that, sooner or later he is looking for another job or the company is looking for another sales manager, because no sales organization can endure unless it is properly controlled and unless their work is properly planned and scheduled. I don't care how much enthusiasm they have, salesmen must get back to cold facts, represented on your balance sheet at the end of the year, and that means nothing but cold, hard facts and cold planning. You must lay your enthusiasm to one side and get down to facts—not enthusiasm but real facts, real plans and real details.

Plan, and plan very carefully. Don't ask salesmen to write a history of the case every night.

Have a statistical department, with a card for every customer, every item you sell, that tells accurately how many dollars and cents of each item are sold each customer in each quarter of the year. But don't tell that to the salesman until the end of the year.

Enthusiasm is a driving force. It is a white heat that welds the two minds together, which makes the sale. In the final analysis, that is what does it. But it is backed up by knowledge.

A certain amount of conservatism goes both ways. A man should be enthused over his merchandise before he goes out. That is natural. But when he goes out on the territory, he must work out his own salvation.

All progress in relation to sales management come from the knowledge which precedes enthusiasm. The cold-blooded, scientific facts given to a man, assuming that this knowledge of selling is just the same; that his training is just the same; and all other things are just the same, are what develop enthusiasm. You cannot generate enthusiasm without knowledge.

Shoe Heels of Auto Tires; Used Only for Dress Wear

A fair market exists in the Seville region for rubber heels, but the climate is very dry and they will never become as popular as in the Spanish regions of greater rainfall. At the same time shoes are more widely used in Seville than in other parts of Spain where the alpargate, or rope and canvas sandal, largely replaces leather footwear. Seville is paved with uneven stones which cause abnormal attrition on rubber heels, but absence of rocky or gritty soil in the rural districts favors their long wear. Old automobile tires are frequently patched on to the heels of workmen's shoes.

No advertising is done, as most shoes are handmade according to the individual specifications of the wearer; he generally has rubber heels put on if they are dress shoes and leaves them off if they are not. Rubber heels are seldom seen on ladies' shoes.

Various Factors Affecting Choice of "Plant Location"

(Continued from page 13)

A cement plant in California was forced to stop the discharge of cement dust into the atmosphere as the coating of cement on nearby orange trees ruined the crop. By installing in the flues electric charging coils, which remove and precipitate the fine dust, the atmosphere in the vicinity was purified and a large saving in cement was effected.

CLIMATE—A dry climate is preferable for cigarette manufacture to preserve the flavor of the tobacco, while a humid atmosphere is desirable in spinning and weaving mills, as it facilitates the manipulation of the fabric. With artificial air conditioning and humidity control, textile and other mills can be located without regard to climatic conditions.

Industries which require high temperatures for melting purposes, like iron, steel and glass plants, usually avoid hot climates. One of the limitations of the Birmingham steel district in Alabama is the necessity of employing negro labor almost exclusively, as white men cannot stand the Summer temperatures around a steel plant.

PERISHABILITY OF PRODUCT—Plants which make foodstuffs, drugs and chemicals must locate to suit the characteristics of the materials handled. Dairies for making butter and cheese belong in the agricultural districts, canneries for packing fish at the fishing ports, while meat packing establishments are near the centers of distribution.

WASTE DISPOSAL—Woodworking shops usually find it more economical to burn wood refuse under their boilers, as a partial substitute for coal, than to sell it to local consumers. With the greater efforts to salvage waste materials, commercial uses are being made of numerous by-products, which formerly went to waste. Meat-packing establishments utilize practically all of the waste products in the manufacture of soap, glue, buttons, combs, paper cutters, fertilizers, etc. A group of allied industries, mostly owned by the packing companies, are adjacent to and dependent on the parent company for their raw materials.

Legal restrictions on the pollution of rivers and lakes are factors that must be considered by chemical industries or isolated plants confronted with the problem of sewage disposal.

ACCESSIBILITY—Unless a plant is conveniently accessible and is served by trolley, train or bus line, the maintenance of a sufficient and satisfactory force of employes may be difficult. It is frequently necessary for the industry to provide homes for the workers, if the location is an isolated one or if there is a shortage of housing facilities.

MUNICIPAL AIDS—The plant is a benefit to the community on account of the resulting increase in population with corresponding increase in purchasing power, the additional homes required, new improvements with an increase in value of real estate, extra revenue from taxes, etc. The conveniences and facilities of the town or city, such as water supply, sewers, paved streets, fire and police protection, trolley or bus service, hospitals, schools, libraries, etc., are of use to the company and its employes.

The problem of the town is to get in touch with new industries looking for a site, and present complete information on the town's advantages. This work is usually handled in an organized way by the local Chamber of Commerce, in co-operation with the municipal authorities. Inducements in the form of a free site, reduced taxes, extension of the town facilities, etc., are sometimes offered, if the industry will be of sufficient size to warrant such action.

After the town has been chosen, the selection of the site justifies a study of available property from the standpoint of size, shape, location, etc. The point to be considered as tabulated on the chart include:

1. Proximity to one or more railroads.
2. Elevation with respect to railroad and local highway.
3. Approach for railroad siding.
4. Topography and proportions for economical layout.
5. Cost of improving.
6. Character of soil.

"First in the Field — Still Second to None"

AUTOMOBILE—AVIATION

NEARLY half a million used automobiles were in the hands of dealers at the close of 1923, representing an investment of more than $153,800,000, according to a survey recently completed by the National Dealers' Association. The actual figures, showing comparisons between Dec. 31, 1922, and 1923, were as follows:

	1922	1923
Cars on hand	396,400	449,520
Average acquisition cost	$353.74	$322.31
Total capital investment	$150,264,300	$153,820,000
Average capital invst. per dealer..........	$3,506.62	$3,845.50
Average number of cars per dealer	11.23	9.91

Officials of the Association believe these figures forecast, in a large measure, what can be expected in 1924 in the handling of used cars—that there will be a large increase in the number of used car deals in 1924 at considerably less per car; the greater number of deals will cost more to handle per car with lesser prices involved, increasing the possibilities of loss and the necessity for greater watchfulness on the part of the dealers.

Fords One-half 1923 Auto Output

The Ford Motor Co. made 2,200,682 automobiles, trucks and tractors in 1923—775,059 more than in any previous year, according to production figures for the year. Of the total, 1,915,485 automobiles and trucks were made in this country and 175,474 in foreign plants, including Canada. To the total of these are added 101,898 tractors and 7,825 Lincoln cars.

Charcoal Gas for Fuel

An automobile propelled by gas generated from the combustion of charcoal was recently given what was pronounced a successful test at Lyon, France, in the presence of a large number of Government officials and technical experts.

The machine traveled sixty miles on thirty-three pounds of charcoal costing 25 cents, or less than one-fourth the cost had gasoline been used. The charcoal is generated in a compartment built into the rear of the body of the car. The process is that of an Alsatian engineer named Imberl.

More Tires Exported; Values Less

The value of tires and tire accessories exported from the United States in 1923, $20,320,753, was less than in 1922, $20,709,982, although the volume of business increased materially in each class of exports, according to the Rubber Division of the Department of Commerce. The competition in the tire trade from countries with depreciated currency has forced American manufacturers to reduce export prices close to cost. The average unit value of automobile casings exported in 1922 was $12.52, in 1923, $11.22. Meantime, fabric tires were displaced by cords in export trade, which means that cord tires were sold as low in export markets during 1923 as fabric tires in 1922. The unit value per inner tube shipped decreased from $1.89 in 1922 to $1.71 in 1923, in spite of the fact that the average price of crude rubber in 1923 was about double the average price in 1922. Exports of solid tires for motor trucks have registered extraordinary gains in the past year.

Olds Boosts Production

An increased production of more than 400 per cent over the first month of 1923 is reported for January by the Olds Motor Works at Lansing, Mich. During the month just closed the production was slightly in excess of 8,000 cars. During January, 1923, before the introduction of the new six-cylinder Oldsmobile, the production was 1,804.

French to Study U. S. Auto Field

Ten automobile engineers of the Citroen Automobile Manufacturing Company of France have arrived in the United States. Several months ago Citroen, who has manufactured one of the most economical cars in Europe, came to America to investigate the fertility of the manufacturing field with a view to developing his output in this country. He stated in sailing that he expected to return in 1924, when the time would be more auspicious for financing the enterprise. The ten engineers are here to study the automobile manufacturing field and make those industrial surveys which are essential before actual construction and building operations are begun.

The Haynes Automobile Company, Kokomo, Ind., has announced the following appointments to high executive positions:

Haynes Eames, of Cleveland, once a power in Studebaker and Westinghouse affairs, and organizer of the Small Arms Division of the War Department, as General Manager.

S. E. Burke, formerly General Sales Manager of Williams & Hastings, Hupmobile distributors in Detroit, and generally credited in that city with raising Hupmobile from twenty-second to third position in sales in that city, as General Sales Manager.

F. F. Russell, formerly General Works Manager of the Locomobile Company of America, as General Works Manager.

Repeal of the 5 per cent excise tax on automobile accessories is urged by the Automotive Manufacturers' Association.

arious Factors Affecting Choice of "Plant Location"

(*Continued from page 19*)

7. Convenience to trolley, railroad station or bus line.
8. Convenience to home districts.
9. Is a water front necessary?
10. Advertising value.

INDUSTRIAL LAYOUT—Too much ress cannot be placed upon the importince of having the plant laid out to suit ie manufacturing requirements, with defiite provision for future expansion. It necessary to have departments located i logical sequence and of proper size and rrangement to insure economy of operaon, with the least amount of handling and ucking. The best practice is to have a lock plan made of the anticipated ultiiate development, and then provide such ortions of the plant as will be required t first for the initial building unit. When nlarged in the future the additions conorm to a definite scheme of expansion, and f the layout is sufficiently flexible, the roduction balance between departments s maintained without the necessity of exensive rearrangement.

With this ideal layout as a guide, the ize, shape and adaptability of a prosiective site can be checked before purhase. If the land has been acquired beore the industrial layout is determined, he latter must conform to the property imitations and may or may not prove an deal layout, depending upon the size and hape of the site selected.

CONCLUSION—From the foregoing discussion of the various factors, which should not be overlooked when selecting a factory site, it is quite evident that location is too vital a subject to be settled primarily on the basis of personal preference or in response to the special inducements of an enterprising town or real estate agent. If the business is to be established with regard to the future, the leading points for or against a particular location should be carefully weighed and compared for the industry in question, with due consideration of the relative importance of the economic factors involved.

Well established industrial centers are not so much the result of chance or coincidence, as of logical economic development. A daring pioneer may start a community or industry in a new locality, but the result may prove unsatisfactory. Whether a business depression comes or not, the town or industry with the greatest number of economic features in its favor has the best chance of survival and continuous development.

When the detail knowledge of the manufacturer or business man, in regard to his particular needs, are combined with the specific information which engineering specialists in site selection and plant layouts can contribute, the resultant achievement should be a correctly located plant, economically planned and suitably designed for economic production and anticipated future expansion.

Tax Repeal on Messages Is Recommended to Congress

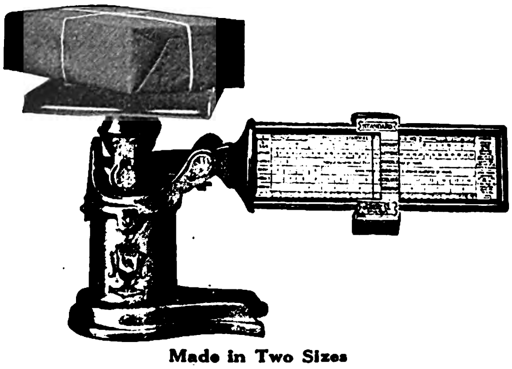
The fight initiated by MANUFACTURERS NEWS for the repeal of Federal "nuisance taxes," and especially the tax levied by the Government on telegraph and telephone messages, has started on its official way to success. After both President Coolidge and Secretary of the Treasury Mellon, in official messages to Congress, recommended the repeal of these burdensome taxes, the Ways and Means Committee of the House of Representatives of Congress took up the subject and has agreed to recommend to the House the repeal of many miscellaneous excise taxes. Among them are those on telegraph and telephone messages and leased wires, beverages, candy, theatre tickets, hunting knives and garments, yachts and motor boats, carpets and rugs, trunks, valises, purses and pocketbooks, portable lighting fixtures and fans.

The action taken by the Committee means a total loss in revenue to the Government of approximately $103,254,488 annually, as follows:

Telegraph and telephone, $30,380,783; beverages, $10,131,896; admissions, $33,000,000; theatres' seating tax, $1,712,566; candy, $11,315,465; hunting, bowie and dirk knives, $31,506; livery and livery boots, $138,233; hunting garments, $168,274; yachts and motor boats, $267,079; carpets and rugs, $928,609; trunks, $46,610; valises, etc., $34,008; purses and pocketbooks, $151,105; portable lighting fixtures, $229,575; fans, $11,081; jewelry etc., $10,000,000; produce sales $3,507,000; bowling and billiards, $1,200,000.

"Standard" Postal Scale

With Adjustable Beam and Interchangeable Dial



Made in Two Sizes
No. 2 "Standard" Capacity 2 pounds
No. 4 "Standard" Capacity 4 pounds

A fine wire on the sliding poise indicates the cost in cents on all different classes of mail matter.

The beam can be instantly turned by the hand to any angle, so that the dial can be read from any position.

In case the postal rates should change at any time, a new enameled dial can be mailed and inserted by anyone. This insures a perpetual scale. Warranted accurate.

CONSTRUCTION BOND

"The Paper of Known Substantial VALUE"

FIRST impressions do count and they mean just as much in the letters you write as in the interviews which your salesmen secure to sell your goods.

The first impression which any letter makes depends on the stationery on which it is written. For as you have frequently heard —"Your stationery is your business photograph."

You can secure, if you are willing to pay the price, impressive stationery which ***advertises*** its ***expensiveness*** and, theretofore, inevitably suggests extravagant methods, high prices and fat profits—or you can use CONSTRUCTION BOND, the Paper that makes Impressive Stationery at a USABLE PRICE.

Construction Bond is known to be less costly for its quality than other fine bond papers because it is marketed not through local jobbers a ***fraction of a ream*** or more at a time, to any printer or lithographer who will buy them, but ***direct*** to ***responsible*** printers and lithographers throughout the United States, in quantities of ***500 lbs. or more*** at a time.

Thus every sheet of Construction Bond goes into your business stationery ***minus*** the usual jobber's profit, ***minus*** his expenses of handling small lots, minus his losses on small and questionable accounts—only the expenses essential to perfect distribution and service are left.

The next time you order stationery be sure to specify Construction Bond, "The Paper that makes Impressive Stationery at a Usable Price."

W. E. WROE & CO.
22 W. Monroe St. Chicago, Ill.

BUSINESS AND FINANCE

Huge Sum of Nearly $5,000,000,000 in New Capital Flotations in 1923—New High Mark for Farm Loan Issues

NEARLY $5,000,000,000 of new capital flotations were issued in 1923, the largest amount since the World War except 1922, which went somewhat over $5,000,000,000, or more than $10,000,000,000 in the two past years. This certainly is a noteworthy record—a marvel of financing.

December capital flotations were somewhat lower than the preceding month, though considerably above the figures of the closing month of 1922. December's total was $397,463,198 against the 1922 total of $304,530,050.

These tabulations, compiled by the *Commercial & Financial Chronicle* of New York, include the stock, bond and note issues by corporations and by states and municipalities, foreign and domestic, and also Farm Loan issues.

Making a detailed analysis of the corporate offerings in December, the amount of financing by public utilities exceeded the combined total for railroads and industrials. The public utility issues in December amounted to $160,828,000; industrial issues totaled $104,643,475, while railroad offerings aggregated only $21,507,000. In November the public utility total was even larger amounting to $191,770,552, as against $107,177,900 for industrials and $88,092,452 for railroads.

A summary of the past twelve months of 1923 shows the following:

January	$879,268,265
February	380,187,119
March	392,262,540
April	458,133,469
May	312,635,831
June	536,577,225
July	197,467,011
August	224,867,650
September	249,734,549
October	390,106,577
November	539,740,990
December	397,463,198

Comparing these figures with the twelve month period of the four preceding years, thus affording a 5-year comparison, shows 1923 ahead of any other post-war year except 1922, as follows:

1923	$4,985,474,692
1922	5,244,862,294
1921	4,203,793,085
1920	4,010,048,184
1919	4,281,188,860

"The Farm Loan issues have established a new high record at $392,505,000 for 1923, against $386,415,000 for 1922, $121,940,000 for 1921 and nothing for 1920," says the *Commercial & Financial Chronicle*. "The total of the corporate flotations also breaks all records, the financing on behalf of corporations having reached a total of $3,261,140,088 in 1923, against $3,073,282,447 in 1922, $2,390,907,811 in 1921, $2,966,304,697 in 1920 and $2,739,653,646 in 1919. A distinctive feature of these corporate issues has been the predominant part occupied by the securities of public utilities. In 1923 these constituted considerably over one-third the whole amount, the financing on behalf of public utilities having reached $1,138,396,158 in that year, against $980,433,795 in 1922, $671,085,220 in 1921, $496,822,550 in 1920 and $462,271,650 in 1919."

U. S. Inheritance Taxes

In 1922 the Federal and state inheritance taxes collected in this country reached the total of $210,000,000, according to the statistician of the Portland, Ore., Chamber of Commerce. The record by years since 1917 is as follows:

Year.	Federal.	State.
1917	$ 6,076,575.26	$34,626,312.18
1918	47,452,879.78	36,978,779.78
1919	82,029,988.13	42,512,872.06
1920	103,635,563.24	60,614,273.45
1921	154,043,260.39	64,519,907.33
1922	139,418,846.04	71,255,906.05

In some states inheritance taxes are one of the main sources of revenue.

Trust Company Section to Meet

The fifth mid-Winter conference of the Trust Company Division of the American Bankers' Association will be held in New York on Feb. 13 and 14. Lucius Teter, President of the Chicago Trust Company and Vice-President of the Trust Company Division, will preside at all sessions.

Topics of discussion at the business sessions will include: Policies to be pursued in acceptance of new business; fundamentals of correct trust charges; investing trust funds; auditing practice in connection with trusts; co-operation between trust companies; insurance trusts, and business extension, including the budget and its apportionment, indirect and direct solicitation of business and results.

China's Financial Commission

Three times during the past eighteen months China has appointed financial commissions whose principal function was that of bringing order out of chaos in the nation's finances. In July, 1922, Tung Kang, then Minister of Finance, appointed a National Financial Commission with Dr. Wellington Koo as its Chairman. Before this Commission had gotten under way the Chairman, Dr. Koo, was made Minister of Foreign Affairs and Tung Kang surrendered the portfolio of Finance Minister.

Again on Sept. 8, 1922, a presidential mandate was promulgated, calling for a National Financial Conference to meet in Peking to discuss ways and means for the rehabilitation of China's finances. The so-called National Financial Conference was not supposed to supersede the National Financial Commission, but was to approach the problem of China's financial status from a different angle.

Both Commissions apparently resolved themselves into a National Commission for the study of financial problems, under the leadership of Chang Ying-hua, who had been Finance Minister for a few days following Tunk Kang's regime. Under this Commission the plans for the financial reconstruction of China proposed by G. Padoux, adviser to the Chinese Government, and of Chang Ying-hua, were produced.

This Commission is composed of fifteen members, thirty technical experts, eight secretaries, twenty assistants, and a number of honorary members and advisers.

American Radiator Election

Clarence M. Woolley, for twenty-two years President of the American Radiator Company, was elected Chairman of the Board of Directors, at a recent meeting of the Board, held in New York. Charles M. Parker was elected President, succeeding Mr. Woolley. C. K. Foster, Vice-President, will have charge of the Western executive offices, Chicago, Ill.

Costs Association, South Section, Meets on Feb. 15

The next monthly meeting and dinner of the Southern Division of the Illinois Manufacturers' Costs Association will be held at the Missouri Athletic Club, St. Louis, Mo., on Friday evening, Feb. 15. The dinner will be at 6:30 o'clock, and the speakers will be E. M. Hicok, of the Western Electric Company and President of the Illinois Manufacturers' Costs Association, Chicago, on "Inventories," and L. L. Daly, of the Daly-Seddon Company, St. Louis, on "Financing the Corporation."

German Liquid Wealth In U. S. Placed at $200,000,000

American bankers who have made a special study of the question of German liquid wealth in the United States put the aggregate at $200,000,000.

The most widely accepted popular supposition is that the cash and liquid balances of German nationals in New York alone amount to $1,000,000,000. One estimate has been advanced to the staggering total of $5,000,000,000. Bankers' estimates, both of those who have on their books German accounts and those who have not, are much more conservative. The estimate which most bankers regard as accurate is $200,000,000—this money in cash, bankers' acceptances, Treasury certificates and Liberty bonds. A nest-egg of this size, it is pointed out, could be used as the basis for from $1,000,000,000 to $2,000,000,000 worth of business.

Hearings on Waterway Bills

There will be hearings at Washington, beginning next Monday, Feb. 11, on the Hull Bill, H. R. 5,475, for the improving of the Illinois River channel, and upon the Newton Bill, H. R. 3,921 for co-ordination and improvement of the channels in the Ohio, Mississippi and Missouri Rivers.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

THE UNITED STATES is lighting the world. Its electric lights twinkle in a undred different countries, colonies, proctorates, mandated territories and island communities, literally the world over. To celand at the far North, to the Southernmost communities of Africa, South Ameria and Oceania and to all countries and olonies lying between those extremes the manufacturers of the United States are ending millions of dollars worth of elecrical lighting appliances.

It was only in 1913, says the *Trade Record* of The National City Bank of New York, that the exportation of electric lighting apparatus was deemed of sufficient importance to warrant mention in the export records of the country and in that year he number of "incandescent lamps" exported was less than 3,000,000 with a value of a half million dollars, yet the total number of lamps exported from the beginning of 1913 to the end of 1923 is more han 100,000,000 and their value, in round erms, $25,000,000.

This growing world demand for electrical appliances and machinery is evidenced by the fact that our exports of the group officially designated as "electrical machinery and appliances" has aggregated about $650,000,000 in the last dozen years, and the distribution has been absolutely worldwide. The capital of the factories producing electrical machinery, apparatus and supplies is reported by the census as $857,855,000 in 1919 against $83,660,000 in 1899, or ten times as much in 1919 as 20 years earlier. The latest census report shows the total number of incandescent lamps manufactured in the United States in 1921 at 247,000,000 with a total valuation of $59,728,398, against approximately 100,000,000 in 1914.

Penny's-worth of Electricity

A penny invested in electric current at the average rate, will:

Run a vacuum cleaner approximately 40 minutes.

Operate a washing machine approximately 50 minutes.

Heat a six-pound flat iron approximately 25 minutes.

Heat a toaster long enough to toast 16 slices of bread.

Brew 5 cups of coffee in a percolator.

Heat a waffle iron long enough to cook 20 waffles.

Keep warm a heating pad from 3 to 6 hours.

Run a sewing machine approximately 3 hours.

Heat a curling iron once a day for 3 weeks.

Operate a vibrator, 20-minute treatments daily, for 11 days.

Insull Medal for Saving Life

Clifford Foust, an employe in the general engineering laboratory of the General Electric Company, Schenectady, N. Y., was recently awarded the Insull medal for resuscitation, in recognition of his use of the prone pressure method of resuscitation in saving the life of another employe in the laboratory in February, 1923. The medal was presented to Mr. Foust in Schenectady by C. E. Eveleth, Manager of the General Electric plant there, who acted in behalf of Samuel Insull of Chicago, donor of the medal.

The medal award was established by Mr. Insull some time after he became interested in the prone pressure method of resuscitation, in an endeavor to recognize and encourage the spread of this knowledge. Mr. Foust is the first employe of the General Electric Company to receive it.

When Telephone Is Busy

More telephone receivers come off their hooks between 9 and 10 o'clock in the morning than any other time of the day in the typical city. This "peak of the load" is due to the opening of business houses and orders being placed with the butcher, grocer and baker by housewives.

Between 12 and 1 o'clock the telephone traffic again rises while lunch engagements are made, then drops off until between 3 and 4 p. m. which is the busy period in the shopping districts.

Another peak is reached between 4 and 5 p. m. when the offices begin closing and again at 7 o'clock when evening "dates" are made. After that the traffic dwindles away and at midnight the switchboard is practically idle.

Telephone Good for Ears

There is quite a notion that the use of the telephone is bad for the ear. Perhaps that can be tested. In most cases it is the left ear that goes to the telephone receiver. And, according to the *News Bulletin* of the Kansas Committee on Public Utility Information, the left ear is the better ear. More than that, according to this authority, it is the telephone that makes it better. "Left ears, as a result of this practice have become far more sensitive than right ears," says the *Bulletin*. And if you don't believe, you are invited to put the telephone receiver to your right ear and prove it.

Electric Output Gains 26%

Production totaling approximately 66,000,000,000 kilowatt hours of electricity by the central stations of the country in 1923 marks an increase of 26 per cent over 1922 and establishes a new high record for the light and power industry, according to a statement by the New York State Committee on Public Utility Information.

Customer Cooperation

TELEPHONE service consists essentially in providing the facilities for communication.

Reduced to fundamentals, it may be stated thus:—

A is provided with a telephone.
B is provided with a telephone.
C, through wires and mechanism, connects these two telephones.

Satisfaction with the service depends largely on A and B.

From the very beginning their cooperation is imperative. A must call B and B must answer. Doing these things in the way which makes for good service involves:—

1—Such care in asking for the number as one would use in addressing a letter.
2—Such promptness in answering the call as one would give to keeping a personal appointment.
3—Such courtesy as one would show in making or receiving a business or social call.
4—Such clear, correct speech as one would use in the face-to-face transaction of the most important business.

Each subscriber can increase the effectiveness of his telephone communication by such thoughtfulness as he would employ in his daily life.

QUALITY, PREPARATION AND SERVICE

To claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

THE new V-63 Two-Passenger Coupe possesses so many qualities of grace and individuality that it has quickly won the approval of discriminating motorists.

Its body design—luxurious and distinctive—has no doubt contributed largely to the preference it enjoys.

But, as in all models of V-63, it is the smoothness of performance of its inherently balanced motor, the positive action of its four-wheel brakes and the dependability which ever has distinguished Cadillac that carries the greatest appeal to the exacting and thoughtful purchaser.

Manufacturers News is published every Saturday by Glenn & Company, 76 W. Monroe St., Chicago, Illinois. Subscription price $4.00 a year; 15 cents a copy. Entered as second class matter March 4, 1912, at the Post Office at Chicago, Ill., under act of March 3, 1879.

A Hotel for Chicagoans

THE Congress has been in Chicago for many years. It has gained, in that time, the respect of the public which it serves. Guests come from distant parts of the country, and the world, every day. Many of them are travellers who enjoy the hospitality of the Congress year after year. Chicagoans have an equal regard for it. They come, as a matter of course, for luncheons, dinners, balls, supper dances and conventions. The sincerity of their pleasure in the Congress is the factor which makes the hotel's management most certain of its progress. Their endorsement is the commendation of those who know best.

Playing Your Part in Your Community

What will your community be ten, fifteen or twenty years from now? Will it be more prosperous, more beautiful — a more desirable place to live and work in than today?

It will, if you play your part.

Look around you. Somewhere you have seen the magic of concrete roads—the tonic effect of concrete streets. Have seen business improved through buildings made firesafe, sanitary and permanent with concrete. Have seen the greater sense of security and pride that comes from concrete schools, churches, theaters and homes.

If you are boosting for similar advantages in your own community — your home town — you are truly playing your part.

Portland Cement Association service helps anyone to play his part well.

It is a free service for the owner, the builder, the architect, the contractor, the engineer—for everyone interested in getting the greatest value from concrete construction.

The cement industry has made this service possible through the Portland Cement Association. It is a service, offered without any obligation.

Write us for any help you need in using concrete.

Where State Police Are Needed

MOB violence broke out again last week in "Bloody" Williamson County, Illinois, and several companies of militia are now preserving order. Williamson County, where in June, 1922, nineteen open-shop coal miners were butchered to make a union labor holiday, is runing true to form. It will cost the State probably a million dollars to pay for the State troops. This would be sufficient to pay the cost of maintaining State police for several years. State police is the only preventive of such lawlessness as habitually prevails in Williamson County, and the sooner the State Legislature realizes that fact the better.

High Cost of Manufacturing

MANY farmers complain about the high cost of manufactured articles. But their friends among the Federal politicians, including Senator Frazier of North Dakota, seriously object to anything that would give relief to the farmers from prices considered unduly high, as in the instance of farm machinery.

The principal cost of all manufactured articles is labor and raw material, including steel and coal. Shutting out immigration naturally adds materially to the cost of labor. Immigration is restricted for the purpose of keeping wages up. Senator Frazier favors restricted immigration. High wages undoubtedly are a good thing, but you can't have high wages and low commodity costs; the two don't go together. It costs twice as much now as it did in 1914 to make a reaper or a plow.

Protecting Home Industries

IT is natural for a state to protect its own industries, but there is such a thing as carrying discrimination in favor of home products too far. New York State insurance men are behind a bill, H. B. 134, that is intended to shut out all outside insurance companies or agents from doing business in that state. If the measure is passed it would prevent exporters from obtaining certain kinds of marine insurance, protection against pilferage, or insurance in foreign warehouses. The insurance interests probably don't care anything about that, but if manufacturers from the Middle West are forced to ship from some other port than New York, the New York General Assembly will see the light. The Illinois Manufacturers' Association has protested against the bill. Other organizations are expected to take similar action.

European Conditions Not So Bad

CONDITIONS in Europe steadily are growing better. There is much cause for optimism in the report which indicates that European imports from the United States in December increased 30 per cent. People who are on the verge of war, starvation or financial collapse do not increase their importations. Prosperity increases in the United States as our exports increase.

Economy That Appeals

LET us pause a moment from consideration of the Mellon Tax Plan and the Teapot Dome controversy, to take up a matter of even greater importance. We refer to the proposal to cut down the weight of golf balls to 1.55 ounces. Business men who believe in economy in high places and tax reduction should get behind this movement in the interest of economy.

Under the standard weight of golf balls (1.62 ounces), drives are becoming so long that millions of dollars must be expended in costly golf links. Links of 7,000 yards constitute a serious financial drain upon the United States.

A series of tests lately have been conducted by the United States Golf Association which indicates that by cutting down the weight of golf balls to 1.55 ounces, drives may be shortened by from twenty to twenty-five yards. The possibility of greatly reducing the area of golf links will be apparent at once to thousands of substantial citizens who are addicted to golf in their leisure hours and who have served on financial committees of golf clubs.

As a sporting proposition the lighter golf ball will appeal, because it is more conducive to slices and hooks and has a much shorter roll than the heavier pill.

One Reason Why Meat Is Expensive

THERE are so many trimmers and pussyfooters among government employes (which is quite natural because most of them owe their positions to timorous politicians), that it is refreshing to note one who has nerve enough to say what he thinks.

Charles J. Brand, Consulting Specialist in Marketing for the United States Department of Agriculture, recently in Omaha advised delegates to the convention of the American Live Stock Association that meat costs to consumers could be lowered through the establishment of chain stores managed by meat packing companies.

If a meat packer had advanced such a proposition, some Congressman with a view to the retail butcher shop vote, possibly would have denounced it as an exhibition of high treason.

Mr. Brand said that, according to the last census, a total of approximately 4,163,000 persons were employed in retail and wholesale distribution, or more than 16 per cent of all persons engaged in all occupations. In other words, one out of every ten workers in the United States is employed in retail merchandising.

No wonder we have to pay so much for our porterhouse steak and pork chops. There are too many retail meat stores which have to make a profit out of the public. As pointed out by Mr. Brand, a saving of 10 per cent in the retail selling price would result in a saving of over $300,000,000 a year.

Beneficial Effect of High Rents

HIGH rents in the loop district of Chicago are driving tenants to buildings North of the river, West of Wells Street and South of Van Buren Street. The exodus began several years ago, but within the last year or two it has amounted to a migration. The improvement of Michigan Avenue helped, but the high rents really have been the cause of a healthy extension of the downtown district. Congestion is relieved. Similar causes have produced corresponding effects in other large cities.

High rents of apartments and other residences have caused an unprecedented building boom which is largely the reason for so much industrial prosperity in this country. It has driven hundreds of thousands of people to buy homes or to take preliminary steps toward getting out of the tenant class. It is an ill wind that blows nobody any good.

\dvertising Is Real Need of Farmer

Organization for Merchandising First Great Essential to Success—Cost Mark Worth Billions to Agriculture

By **JOHN M. KELLEY**
Vice-President, National Holstein Association, Baraboo, Wis.

AGRICULTURE is the base of all industries. Eighty billions of dollars are invested in it. There are over 6,000,000 farm homes, and 31,000,000 people wrapped up in it.

No person who writes "U. S." in his dress can say he is not interested in ming and dairying, for the success or lure of the farmer is unmistakably rected in the welfare of every other line business. The farmer's welfare is the lance wheel to the nation's prosperity.

Today the buying power of the farmer paralyzed. Farming is out of step in the pid advance of industry. The world's eatest industry is without ganization, without leaderip, has no merchandising stem and operates at a loss. Business Organization, mmon to big business and anufacturing, is unknown in rming and dairying, for rming has been an occupaon—not a business. The tensely vital economic prinples of business, set up by l other industries, have ver been adopted by the rmer.

To establish business sysm in production and modern erchandising in selling is e key to the farm problem. merica's great problem is to ach the farmer how to prouce on a quality basis and ll on a paying basis.

The Illinois Manufacturers' ssociation has started a real rogram. Farmers should get quainted with the fundaentals in business.

Big business should look riously into the problems of the farmer.

If farming and dairying will invite anufacturers to lend the service of exerts, skilled and experienced in organizaon work, in manufacturing and assemling food products, in merchandising and dvertising, it will accomplish the first ssential step on the road to farm success. here is a wonderful psychology in the novement. It will lend assurance and reate confidence.

Judged by every business standard, farmng is a failure.

But—put on a business basis, farming, rom every viewpoint, holds the greatest pportunity for advancement and progress f any industry in the world.

In point of importance, in value of output, in the number engaged, agriculture holds first place. It ranks above coal, oil, steel, railroads, automobiles. In point of net return it is at the bottom of the list. It does not compare with the least of the industries, or non-essentials, or luxuries.

The Yellow Cab Company in Chicago is annually declaring more net earnings and has established more value to good will in business, than all the farmers of the country.

Farming 20 Years Behind the Times

ONCE a trooper with a big circus carried a trick dog. When the show was in Chicago the dog buried his bone beside the center pole on the lot. During the night the show moved on. The next day the dog made the dirt fly in a frantic effort to dig out his bone beside the center pole in Milwaukee.

The dog did not know that in the march of Progress the world moves speedily on.

Farmers exhibit traits that remind one of this incident.

About fifty years ago they buried every principle of marketing and advertising beside the center pole of progress. This pole has been moved so far forward in the march of events that farmers have lost their landmark. Farmers today are looking for progress in methods that are twenty years behind the times.

No industry can survive and follow the methods that obtain in farming.

If Rockefeller handled his business as farming is conducted, gasoline would sell at $5 a gallon to pay cost of operation.

Success in farming will come only when the present-day methods in organization, merchandising and advertising are adopted that have brought success to the automobile, gum, rubber heels, circus, tobacco and other lines.

William Wrigley, last year, after paying taxes, made a net profit of over $6,000,000. He had nearly $7,000,000 in reserve, $7,000,000 in surplus and set up $6,000,000 to good will. Thirty-one million dollars engaged in agriculture operated last year at a loss, and have never set up 30 cents for good will in business.

Substitutes have captured from 30 to 40 per cent of the farmer's trade and yield tremendous net returns, while he is floundering with the real article, confused as to method and unorganized.

Other industries are organized—have a trade name and advertise.

There is a mistaken belief that farmers and dairymen are producing economically. They are producing at low cost, made possible because they give their labor free, make a gratuity of the services of farm women and children, forget a reserve fund and the interest on investment.

An intensive business system, applied to farming and dairying, would reduce cost 30 per cent.

There is a tremendous loss due to failure to check waste, failure to keep an accounting system or a balance sheet. There is loss through duplication of service, and through failure of the principle of centralzation in manufacture and merchandising.

There is no other industry on earth that could keep going six months operated as farming is conducted.

While co-operative marketing of farm and dairy products is the only way out, yet a constructive system of co-operative marketing cannot be applied to farming until existing abuses all along the line are corrected.

Farmers too often misinterpret the term co-operative marketing to mean economic production, to the utter neglect of merchandising.

Co-operative marketing, as attempted in many places, would be more correctly called co-operative bungling.

The term "co-operative" is like prohibition. So many abuses have been committed under its name, that I feel like coining some other term.

To set up a system of co-operative marketing is not unlike prescribing a diet for a patient. It must be made to suit the needs of the individual case. A diet suited to the needs of a Laplander might need some correcting when given to a Southerner. A diet for a plump lady on the reducing schedule would be ill-suited to a farm hand.

Practical merchandising detail for marketing California fruit may be unsuited to the marketing of cheese, butter or potatoes. One can no more prescribe co-operative merchandising as a blanket remedy than you can prescribe a general diet and have it fit all cases.

May I suggest a few of the conditions existing in farming that would defeat any system of merchandising?

Farming and dairying have never had a balance sheet and have never put a cost mark on products. A cost mark on products would be worth a billion dollars a year to agriculture. It would put an end to doing business by guess. Not one in a thousand knows production costs for there is no system of accounting.

Only in a limited way is quality standardized.

We have neglected trade means, advertising and the Press Agent.

---

*Address before Farmer-Manufacturer Convention, Chicago, on "Development of Co-operative Marketing."

Bulk Commodity prices prevail on farm and dairy products because they are sold without a trade name.

Good Will value has never been established in farm and dairy products.

Farm buildings and improvements were put up at a time when wages and materials were low in price. Farmers have no fund whatever to take care of replacement or offset depreciation.

The government reports that farmers, in the last seven years, have fallen $10,000,000,000 below par in farm improvements, equipment and repair.

Farm lands have no price on the market today. Farm abandonment and sales through foreclosures are alarming. Capital is not attracted to the farm either for investment or development.

Because of the conditions that exist in agriculture, it is impossible to apply co-operative marketing, without reconstructing the business program all the way from producer to ultimate consumer.

Neither co-operative marketing, Federal price fixing, tariff, legislation, currency regulation nor strikes will bring relief to agriculture as long as these unbusinesslike methods prevail.

Reasons for Failure

One reason why farmers have never organized is that they have been tolerant of the general belief that everything is "all right" in farming. It is the greatest obstruction to progress today.

Organization among farmers is like the definition the Frenchman gave of the bathing suit—"Something that began nowhere and ended at once."

The agricultural problem is so serious today that it calls for something more than the spirit of "Let well enough alone." Lack of initiative has become a farm malady.

Farming is suffering a loss more serious than loss of profit; it is losing the greatest asset it ever had—the farm boy and girl.

Six hundred thousand people left the farms last year, as compared with 200,000 the year before. This is a condition that strikes at the very foundation of agriculture.

Senator McCormick, at the last session of Congress, introduced a bill to amend the Constitution to prohibit wife and child labor in factories. This is sound legislation. But where do the farm women and children come in? Farmers, unorganized, and without leadership, never voiced a protest in defence of the 15,000,000 farm women and children who make a gratuity of their services that their industry may survive.

Is the life of the farm wife and child less valuable to society, than the lives of those who choose their lot in the metropolis? The employed women and child of the city have at least, a limited day, with pay. The farm woman and child have an unlimited day without pay.

A woman may take up service in the best of city homes, receive a high salary—and society calls her a "domestic." But the woman who takes the hand of a farmer at the altar and goes into country life, where wages and the spirit of romance have fled—society calls that matrimony.

Take the tragedy out of farm life and bring back amusement and the spirit of romance. There was a time not far back when the country district provided its own entertainments. It was attractive and satisfactory to those who lived the country life. There was the fiddle and the clog, light hearts and laughter—there was a spirit of contentment on the farm.

For twenty years there has been a constant trend "off" the farm of nearly everything worth while. Farm profit has gone; the chance to homestead has gone; the spirit of romance has fled; entertainment has departed. And the boy and girl are saving up only for transportation to bring them to the big city.

A circus will attract a larger farmer attendance than any program or gospel on agriculture ever constructed. The first need in agriculture today is to construct a big clean program of entertainment and make it available for community country life.

New York spent $20,000,000 last year to see prize fighters pound each other in the ring; 70,000 people saw the World's Series in one day, with 50,000 more in a jam at the gates unable to get in; Ziegfeld Follies opened in New York charging $20 a seat. (A farmer would have to sell a 10-acre field of wheat to give his family three hours' fun at the Follies.)

When you take the profit from a business you take its pride, its romance and its heart. Luxuries, amusements, substitutes—everyone gets the money but the farmer. Everyone else is organized.

The women of Paris last year used up 1,000 tons of face powder. Correspondingly, the people of Europe last year consumed two and a half times as much oleo as we produce of creamery butter in the United States. Those who use oleo need cosmetics—imitation color should go with imitation food.

In the United States the cosmetic bill last year was over $500,000,000. The lip-stick and eye-brow pencils, if stacked, would make a mountain.

The cosmetic can has been advertised. The color that is taken from the cosmetic can will wash off. But ruby lips and rosy cheeks from the milk can is everlasting beauty.

We should tell the world in advertising that the way to beauty is the way to health, and sell the milk can habit to the millions who now use the cosmetic can.

Advertising Is Potential

People will amuse themselves, feed themselves, travel, drink, dress, smoke and sing as they are influenced by advertising. You can change customs, overcome restraint of society or manners, and direct public will by the right sort of advertising.

By advertising, fashions are introduced and styles changed. It will influence women to bare their necks in zero winds in Winter and to wrap themselves in furs in Summer.

Advertising is not merchandise that may be purchased ready made. It is science. To write an "ad" or display a picture one must know the psychology of the human mind, the inspiration that lies in anticipation, and the power of suggestion.

Why is the beautiful girl featured and health emphasized in advertising? All the world loves to look upon the picture of a beautiful girl. By it girls are fascinated, women attracted, and men—men value their eyesight these days! Wise advertisers know the value of smiles and color and ribbons and the atmosphere of good cheer.

What is an advertisement? Someone said it is the picture of a pretty girl, eating, wearing, holding or driving something that somebody has to sell.

There is one underlying essential seized by every concern that sells goods for human consumption. It is the *health* value of the product. Farmers have the real health food. They should appreciate its value and influence trade through advertising.

Farmers have never appreciated the value of trade names. It is the tonic that makes business grow. It is not enough to advertise just "milk" or "butter" or "cheese." The public will respond only when they are taught "what" milk or "why" a certain cheese. Men do not smoke in darkness. They must see as well as taste their smoke, and picture fancies in the rings and curls. So the public will read an "ad" only when it tells a story or makes an appeal.

Put dependable quality in product—then apply the trade name.

It invites selection.

It is "square deal" to business.

It is the only way trade can be built up or maintained.

It is the only way of driving substitutes from the field.

Do tobacco firms advertise just tobacco?

Do shoe manufacturers advertise just shoes?

The trade name identifies quality; we know the good smoke, the preferred automobile tire, a shoe, a rubber heel, a bar of soap—by its trade name. Everything that goes out from the farm goes by the old common name. Farmers buy it back as "Quaker Oats," "Corn Flakes," Aunt Jemima" or "Gold Medal."

"Quo Vadis" Farmer's Trade Name

The railroads carry only two products that are not sold at a fair return of profit—farm and dairy products. When the farmer looks out upon the railroad crossing his farm, and sees a carload of automobiles, of cement, of gasoline, of chewing gum or of butter substitutes, he knows the producer has taken care of the selling when his product reaches the market. But when the railroads move a car of farm or dairy products they all go under the one name—"Quo Vadis"—"Whither goest thou!" He knows not whither his product goes; who traffic in it; what the consumer pays for it or in what condition it is delivered. He seems heedless of the fact that he gets 37 per cent of what the ultimate consumer pays while in Denmark the producer gets 75 per cent.

Too busy following the plow and the cow! Like the fly on the canvas, he is too close to his subject to see the real picture of farming.

(*Continued on page 10*)

The Present Federal Tax Situation*

Ambiguities of Old Income Revenue Laws and Worries of the Taxpayer; Features of Mellon Plan Reviewed

I

YOUR organization is well advised when it undertakes to make a study of Federal taxes. If it were possible for all business men to meet as you e meeting here to discuss the fundamenls of the greatest financial burden of the merican people, there is no question but at a great avalanche of crystallized opinns on sound tax legislation would be unched on Congress with such magnide that partisan politics would not dare thwart so evident a will of the people.

The average man accepts the income tax urden as a necessary evil. He mutely protests that it stifles his business incentive. He sees avenues of escape for others, but nds no benefit to himself. He resists, but resists passively. He accepts the encroachment into his business profits as the invitable. He considers the whole affair bad mess and puts it out of his mind. But when it comes to the time when Congress begins the revision of the law, the average man is helpless. He simply doesn't know what it's all about until the time rolls round when his return becomes due.

The trouble is not with the income tax n itself. We have a national debt of such ize that a tax on incomes is the most expedient method of securing the necessary revenue. The theory of tax on incomes, which places the burden on those most able to pay, is theoretically sound and equitable. It is in the practical application that we find the thorns.

It will be impossible for me to give you a comprehensive picture of the present Federal tax situation in the time allotted to me. However, in order to get a brief understanding of present-day tax affairs, I wish to take you back over the past few years and get a composite picture of the administration of the various laws during those years.

The first law under the 16th Amendment to the Constitution taxing incomes was effective for the year 1913. On account of the increased governmental expenditures due to the European war, a new law was enacted for the year 1916, which materially increased the rates applicable under the 1913 law. With the entry of the United States into the great conflict, the demands on the United States Treasury increased by leaps and bounds. More revenue was needed. The Income Tax Law was again changed and a variation in the form of excess profits tax was enacted. And then began the reign of the mysteries of invested capital, tangibles and intangibles, admissables and inadmissables, and a myriad of other terms of which the ordinary mortal had never before heard. Both the Government and the taxpayer began to flounder. No one seemed to know what it was all about. The administration of the law was vested in the Commissioner of Internal Revenue, along with the duties of collecting revenues from the excise, narcotic and other revenue acts. The enforcement of the Income Tax Law was a mansize job in itself without those other exactions.

By ARTHUR ANDERSEN
Arthur Andersen & Company,
Certified Public Accountants

Lewis-Smith
THE BLACKSTONE
CHICAGO

Arthur Andersen

The 1917 law was ambiguous. The taxpayers tried to decipher the puzzles on the new returns, and then it developed upon the Commissioner and his force to try to decipher what the taxpayers did. They have been working on a lot of those 1917 returns ever since and the puzzles are still unsolved. The main trouble with the 1917 law, as well as with the ensuing acts, was the fact that the Commissioner was left with a vast amount of decisions to make in determining the tax liability along with the duty to collect the tax. He was given the job of prosecutor, judge and executor. If it had not been for the fact that the Commissioners, who have held this job, were endowed with the gift of sympathy and righteousness and attempted to give a liberal interpretation of this law, we might as well have packed up our belongings, gone abroad and left our affairs in the watchful care of Koretz or Dr. Cook. The power in the Commissioner's office was horrible to contemplate.

In order to meet the demands of this symposium of riddles, the Income Tax Unit was created, and an attempt was made to organize a force of several thousand technically trained men and women to assume this triple role of prosecutor, judge and executor which was thrust upon the Commissioner. They recruited some good men. They picked up others who were not so good and many more who only added to the burden.

Worries of the Taxpayer

When the taxpayer finished those 1917 returns he felt at ease and as time wore on he began to commend himself on his keen ability to surmount the intricacies of that 1917 law. But his security was short-lived. When the Unit, several years later, finally got through pruning, scouring, clipping, deleting and deducting items, making frequent use of that now familiar word "Disallowed," and then advised the taxpayer in language of terrific meaning, of a proposed additional assessment of no uncertain size, the life insurance companies should have adjusted their mortality tables. It was a practice in the Bureau at one time to issue comparative weekly work sheets for the various Units showing the number of cases audited and the amount of additional tax found. For a time this started the keenest rivalry. The levying of additional tax became the sole obsession of the Unit. Many a taxpayer felt as if he were in the electric chair, had a rope round his neck and at the same time were facing the firing squad.

Congress found that the 1917 law was not producing the required revenue. Then someone had the courage to tell them also that the Act was a mess and could not be enforced literally.

The 1918 law was enacted, clearing up a great many of the ambiguities of the 1917 law. The rates were greatly increased and, while it was not a wholly perfect law, yet it was all that could be desired in producing revenue. It left open an avenue of avoiding taxes through gifts and the provisions for computing the war and excess profits taxes were perhaps more favorable to some industries and companies than to others.

In 1920, the country was being pounded on the rocks by the waves of reconstruction ills. Relief was necessary. Congress arose to the situation and brought forth the 1921 Act which materially lowered rates, which together with lower incomes resulted in a reduction of over $1,000,000,000 in revenue. The Act also relieved business of many obnoxious restraints imposed by the 1918 law. The 1921 Act partially closed the doors on gifts, but opened up other avenues which enabled many taxpayers to postpone their tax liability through reorganizations, and indicated a way for the reduction of taxes by the creation of trusts and investment corporations. In spite of the reduced rates and these permissible loopholes of the law, the Treasury of the United States has a surplus of revenue of $300,000,000 for the fiscal year of 1922, and it is expected that the surplus for the year 1923 will reach over $400,000,000.

---

*First of two installments of address delivered before Tax Congress of the Illinois Manufacturers' Costs Association.

Hence the Treasury coffers are in good shape, but the surplus is being accumulated to the detriment of the business of the country. Economics in governmental operations should pave the way for a substantial tax reduction.

Congress has now before it a bill familiarly known as the Mellon Plan of Tax Revision. I shall not attempt to review all the details of the bill, but desire to touch on several of the most important provisions, as it is evident that any legislation which is finally passed will hinge about the Mellon Plan.

Features of the Mellon Plan

The outstanding feature of the proposed Bill is that practically all its new provisions have to do with the tax liability of individuals, rather than with corporations. No change is proposed in the rate for corporations, and there are but few changes mentioned in the manner of computing the net income of corporations subject to tax. The new provisions relating to individuals are materially different from the 1921 law. The new law is designed to tax more income at lower rates. It closes the door on minimizing taxes, which has been possible through incorporations, reorganizations, and the creation of trusts. It provides that an individual may incorporate his business or exchange property for the stock of a corporation and have no gain or loss if he is in control through ownership of at least 80 per cent of the voting stock and at least 80 per cent of the total number of shares of all other classes of stock of the corporation, immediately after such exchange.

This is the same as in the old law, but the new law goes further and states that the corporation cannot deduct depreciation or depletion based on any other value of assets than that which was recognized for tax purposes in the hands of the transferor prior to such exchange. Should the new corporation sell any of the assets so acquired, the gain or loss shall be the difference between the selling price and the value in the hands of the transferor, which value shall be cost to the transferor, if acquired after March 1, 1913, or the fair market value if acquired before that date. In other words, there can be no appreciation in the assets received in such a transaction, and the taxpayer can gain nothing in this respect for tax purposes.

If the corporation is organized as a holding company or an investment corporation to reinvest the earnings, the new law proposes to tax the undistributed earnings at 25 per cent. Where such earnings are forced to be distributed, they become taxable in the hands of the individual at surtax rates as dividends.

Several changes are proposed in the provision relating to reorganizations. As I stated before in the case of the transfer of assets to a corporation, by an individual for stock, the basis of determining the depreciation and depletion deductions is the same as would have been allowed the individual had he retained his ownership. The same provision is made effective in the case of a reorganization of existing corporations. The new corporation must compute its depreciation, depletion, or gain or loss on the same basis as would have been used by the old corporation. The 1921 law allows the reorganization to bring into effect the fair market value of the assets as of the date of reorganization as the basis for determining depreciation, depletion and gain or loss from sale.

Where property has been transferred to a corporation by an individual in exchange for stock or securities, or when stock or securities have been exchanged for stock or securities in connection with a reorganization, and where in connection with such exchange no taxable gain or loss has been recognized, the basis for computing the gain or loss on the subsequent sale or other disposition of the new stock or securities, shall be the difference between the selling price and the cost or March 1, 1913, value, whichever is applicable, of the old stock exchanged. This provision is identical in both laws.

Tax on Cash Distribution

Where cash is distributed in connection with a reorganization, the proposed law provides a change in the basis for the taxation of such cash received. Under the 1921 law the new corporation could take over the cash from the old company and distribute it to the stockholders along with its stock. The stockholders would pay a tax on the gain limited by the amount of cash received. If the stock had been held for two years, this gain would be taxable at a rate not to exceed 12½ per cent. Under the proposed law, the cash will probably be taxed at surtax rates if the old corporation had an earned surplus, inasmuch as the law states that a cash distribution, which is in effect a distribution of earnings, is to be taxed as a dividend in connection with a reorganization.

Another provision with reference to reorganizations, which is new in the proposed law, is that a corporation may divide its business into two or more parts making each a separate corporation. It may distribute the stock of the new corporation which it has received in exchange for its assets, to its stockholders without tax liability either to the corporation or to the individual stockholders. Such a distribution shall not be considered a distribution of earnings or profits.

One other outstanding feature of the new law is its provisions in regard to the creation of trusts. The Act of 1921 permitted an individual to form what is called temporary or revocable trusts. He could divide his property through trust agreements which would terminate at his will or at a specified time. The income arising under such agreements was taxable to the trust or to the beneficiaries, depending upon the conditions for the distribution of such income. He could make himself sole beneficiary and allow the trust's income to accumulate, which would be taxable to the trust. He could create an insurance trust wherein the income arising thereunder would be used to pay premiums on life insurance on himself. The income so used would be taxable to the trust. The proposed law has radically changed these provisions. In order that income may be taxed to the trust, the trust must be irrevocable. It must possess full and absolute title to the property. Income of a trust used to pay premiums for life insurance on the life of the grantor is not taxable to the trust, but must be included in computing the net income of the grantor subject to tax. It is also a part of the new law, that the proceeds of such insurance policy must be included in the corpus of the estate for inheritance tax purposes. Thus, whatever privileges a taxpayer may have had under the old law to divide his income through trusts and thereby be taxed in the lower brackets, is to be revoked. It is made obligatory to part forever with the property, before the income from such may be taxed separately.

"Address Mail Correctly" Asks Postmaster General

In an effort to stem the economic waste, that costs the United States Government about $1,740,000 a year, the Postmaster General has designated the week of Feb. 18 to 25 as "Better Mailing Week."

Ever since the organization of the post office the bane of the service has been careless addressing of mail—depositing of letters and packages with incomplete, inadequate or incorrect addresses. Of recent years this carelessness has grown to considerable proportions, and it has been found that the chief offenders are the large patrons of the mails. Private business and private industry, says the Postoffice Department, loses millions of dollars every year from this cause, which, strange to relate, is in the most part preventable.

During that week the Postmaster General will seek the co-operation of Chambers of Commerce, Boards of Trade, large business and industrial enterprises, and the press of the country, with a view to having antiquated mailing lists brought up to date and every check placed against the possibility of letters reaching the postal system without accurate addresses.

It is estimated that 200,000,000 pieces of mail are yearly given "directory service," which means that postal employes must take time from the regular handling and dispatching of mail in the endeavor to provide correct addresses for this huge volume of misdirected matter. In New York City alone the cost of this service approximates $500 daily.

Facts Will Reduce Risk In Industry

Financial Disaster Faces Business Man Who Fails to Make Thorough Research—Human Equation Is a Factor

By **WM. CHAPIN HUNTINGTON**

Business Engineer and Counselor, Chicago, Ill.

> ### How Much Money Would You Invest Without Research?
>
> **ALMOST any business man will say that he wouldn't make an investment without careful investigation, and yet the business world is full of examples of the shrewdest men in commercial life getting "stung."**
>
> **How to avoid business risks and to find business opportunity by getting the facts first, is a question of prime importance to every man who has money to invest. The new profession of the Business Engineer is only on the threshold of its development; business men want the results of hard-boiled business research, and the Business Engineer now steps in to fill the gap between the knowledge of the economist and the action of the investor.**
>
> **Mr. Huntington, the author of this article, has had wide experience. For many years he was in the service of the Federal Government and traveled abroad extensively in this work, coming in contact with the leaders in industry the world over.**
>
> **The second and final installment will be published in the next issue of MANUFACTURERS NEWS.**

I.

IT was a quiet Saturday morning in LaSalle Street. The Business Man was ushered into the private office where the Investment Banker sat smok- ıg a big cigar and studying the sales re- ırns on his most recent issue of industrial onds.

"Good morning, George," said the Bank- r. "Don't you want to buy some rattling ;ood bonds? Here's a strong concern mak- ng a fine product right in the midst of a ich market—something that will bring ou in a clean seven and a half per cent n your money."

"Not interested," replied is friend. "I am just going into a business with no risk, practically speaking, that's sure to yield me 20 per cent a year for the next ten years."

"What is it?" smiled the Banker.

"Greatest thing in the world," said the other, naming a certain electrical household device. "The women will be crazy about it. We've bought a modern factory with the finest machinery and equipment, dirt cheap—one of those that was built for war production, you know. We've got an A-1 manager, and we're going to have astoundingly low cost."

The Banker's smile faded.

"Have you checked up on this, George?" said he. "This particular device has been tried before. Somebody will get one some day, after a lot of people have paid out their good money for experience. Your production may be all right, but what about your distribution? There is always risk enough in putting out a new product to make a thorough investigation well worth your while."

But the cocksure Business Man was in no mood to investigate further. The big factory was equipped, the Production Manager was engaged, and it was not long before thousands of the new device were passing out through the shipping room to all parts of the country. The Advertising Department had been on the job. There was no lack of punch in the sales. In fact, the article almost sold itself, so great was the apparent saving to the housewife in these days of the servant problem.

Then came a day when the machines returned to the factory by dissatisfied users almost equalled the number of new ones going out. Another six months and the business was in the hands of its creditors.

What was the trouble? Production costs were low; any quantity could be turned out; sales were extraordinary. Yes, but the device was too complicated to stand the wear and tear of daily household use. It ran beautifully when carefully serviced by a high-class mechanic. But there was the rub! The company was pouring forth a stream of these machines all the way from Phoenix, Arizona, to Bangor, Maine, and no service organization had been provided to look after them.

Here was a risk that had not been foreseen. The experiment cost the cocksure Business Man and his friends just $3,000,000.

Business "A Pathetic Gamble"

This case is by no means exceptional in business life. Such things are happening every day. Risk is inherent in business. It might almost be said that it is its predominating characteristic. The statement is often made that 90 per cent of all small trading concerns fail. This may be exaggerated and hard to prove, but it is universally conceded that the majority of business enterprises are not financially successful. There is no escaping the income tax figures which tell us cold-bloodedly that in the year 1919—which was a boom year, mind you—over one-third of the corporations in the United States earned no income, but showed a combined deficit of almost $1,000,000,000. We won't talk about 1920 and 1921!

The truth is that the business man stands at the helm of the whole economic system that gives us our food, shelter and clothing. He bears the brunt of all the storms, and the chief characteristic of his income is its irregularity. Profits one year may be eaten up by losses the next.

This is what has led many to declare that business is a game of chance, or as one financial authority recently put it, "for most men a pathetic gamble."

One class of risks in business we have learned how to handle. The experience of generations with fire and theft and loss at sea has given us the basis for the operations of the insurance companies. We minimize the risk by spreading it out over a large area. No business need fail because of fire or tornado. An insurance policy will take care of these contingencies.

But what company would insure the unfortunate corset manufacturer against the bobbed-haired flapper's decision to veto corsets? What policy will cover the losses of a cement plant which, in his enthusiasm for cheap raw materials, some engineer has located at a prohibitive distance from an adequate market? What insurance will protect the stockholders of a new paper mill doomed to ruin because the management failed to corral a sufficient pulp wood supply?

Business may be roughly divided into production and distribution—the internal and external aspect. For twenty-five years engineers have been studying the machinery and management of factories, and their efforts have not been in vain. The principles of proper layout of machines and methods of production are now firmly established and in use in most of the well managed concerns of the country. The cost of production of an article may generally be estimated in advance with considerable accuracy. There is no longer any great risk here. It is in the distribution of our product that we run the chances. In this, the external side of the business, we are right up against human nature in its most exaggerated form in our customers and our competitors.

It is this human equation—this question of when your customer is going to change his mind, or what your competitor is going to do—that makes a business both a venture and an adventure.

Now, until we can thoroughly Prussianize human nature and take all the individuality out of it—and we have just fought a war to prevent this—we shall never be able to absolutely eliminate the risk in business. But we can reduce it.

Knowledge Reduces Risk

The best way to take the hazard out of business is to get the facts. What is called business judgment is just as valuable today as it ever was, but the average business man is a man of good judgment only when he is equipped with the facts.

The President of a large corporation recently terminated a conference of his department heads with these words:

"You have your opinion about this matter and I have mine. Perhaps neither of them is worth anything. Get the facts and figures and let's decide the matter on them and not on opinions. Get enough facts and enough figures and they will decide any question without argument."

The figures published by *Bradstreet's* indicate plainly that most of the failures in the United States happen for want of the facts. Less than 5 per cent of the failures in the year 1921 are listed as due to fraud. More than 80 per cent were found among firms of small capitalization, $5,000 and under. And note this: there were almost no failures among firms of $1,000,000 and over.

There may be several reasons for this, but the principal one is that the big company has better facilities than the little fellow for getting the facts on which to base a business policy. They are more likely to have a nation-wide organization, a network of representatives in constant contact with consumers and competitors in different parts af the country and abroad, a Research and Statistical Department. They do not stampede when somebody starts a scare about over-supply and falling prices. They have taken the trouble to inform themselves as to the true condition of the stocks of their commodity in existence throughout the country, and they know the demand exceeds the supply.

By facts we mean chiefly the sum total of the experience of other business men—competitors, consumers and manufacturers in allied lines. When a lawyer has a hard case to handle he goes into his library and pulls down an armful of books filled with precedents, or in other words, with what has been done and decided in similar instances in the past. When a modern surgeon has a complicated operation to perform, he is apt to consult the best medical literature in order to profit by the experience of the leading specialists in Vienna, San Francisco, or Rochester, Minnesota. If an engineer is confronted with the design of a steam turbine or an automobile engine, he finds the transactions of the great engineering societies and the pages of our splendid technical press filled with articles and charts and drawings reflecting the experience of his contemporaries.

Only the business man has, until recently, been left without the advantage of being able to draw on the experience of other business men. He has been forced to work more or less in the dark with what he could pick up here and there. This is particularly true of the small business concern.

But the days of the Rule of Thumb are ended in business as everywhere else, and the day of Business Research has dawned.

There is a pronounced sentiment abroad in the land that we ought not to have so much risk in business. A little adventure is all right, but too many people are beaten before they start. Besides, all these failures inevitably add to the High Cost of Doing Business.

A banker declared the other day, "The banks simply cannot afford to take the losses in the future that they have tolerated in the past. There must be a more thorough investigation of credits."

The majority of business men are conservative these days. The experience of 1920-21 is still fresh in their minds. The heedless ones have not been allowed to run away with the prosperity wagon in 1923. And, there is a widespread conviction that such landslides as that of 1920-21 must not happen again. Of course, we cannot expect business always to run along on a level concrete road. But the wild climbs and breakneck descents of the picturesque curves of price and production in the past ought to be ironed out into smoother ripples. Careful students of the subject tell us that this is possible. We avoid typhoid epidemics by knowledge. Why can we not use the same method in business?

Where Shall We Go for Facts?

There are three kinds of facts that a business man wants: The facts about his own individual business, the facts about the industry or trade of which he is a part, and information about the general business conditions.

Fortunately today he need no longer be helpless. A variety of agencies are springing up to help him. Some of the best business brains in America are tackling the question. It will soon be too bad if every wide-awake business man in the country does not avail himself of some of the opportunities offered to get the information that will help him to stabilize his business and guarantee his income.

To begin with, there is the magnificent practical work which is being done by the United States Department of Commerce under Secretary Hoover. The Bureau of Foreign and Domestic Commerce of this Department, with its seventeen Commodity Divisions and its network of foreign and domestic representatives, maintains the most intimate working contact with business and industry at home and abroad.

The Bureau of the Census, whose patiently gathered and accurate statistics were in the past too much of a post-mortem to be of much use to an active business man, is now mobilizing a wealth of red-hot figures and facts on production, stocks, orders and prices. Its survey of current business gives the interested business man "a bird's-eye view of the entire industrial and commercial situation of the United States each month, based on actual reported facts instead of guess work and opinion."

Some of our biggest universities have caught the spirit of the times and in their schools of business, professors of economics, no longer content with academic theorizing, are attacking the business man's problems and contributing some good practical results too. There is scarcely a bank or a business house where you do not see on the executives' desks one or more of the nationally-known business services which show the present trend and boldly attempt to forecast the future.

Closer still to the business men are the trade associations. There are hundreds of these in all the principal lines of industry and many of them are doing splendid constructive work in keeping their members posted on the true condition and course of the industry of which they are a part. In this connection a successful man of wide interests said the other day:

"It is essential nowadays to have a good picture in your mind of an industry as a whole. In this way you can better judge the performance of any particular concern. If it is lagging behind its industry, you can be sure of trouble ahead. If it is leading the bunch, it's a safe bet that it's well managed."

Advertising Is Real Need of American Farmer Today

(*Continued from page 6*)

May I offer the following suggestions touching upon a farm marketing plan:

Co-operative marketing in principle, to mean anything, contemplates effective service in every branch of sound, orderly up-to-the minute merchandising.

First, organization is necessary and to that end we would bring to farm life a program of entertainment, as already outlined.

CENTRALIZE, SPECIALIZE, STANDARDIZE, ADVERTISE are the big terms in merchandising.

In a merchandising system the following are important:

Determine production cost; apply the cost mark; operating cost.

Introduce the accountant and the balance sheet.

Commodity assembling, processing, grading, transportation and storage—distribution that will avoid duplication of service, eliminate waste and effect economical delivery.

A Department of Research should be established.

There should be a Bureau of Publicity and a Press Agent.

These essential branches will admit of the development of good will in trade. The farm marketing problem is not a job for the farmer. It is for the expert whose competency rests upon a special training, fitness and experience.

Gross Farm Income in 1923

Gross farm income from sales of all products aggregated $9,500,000,000 in 1923, an increase of half a billion dollars over 1922 and $2,000,000,000 greater than that of 1921, according to figures compiled by the Howard-Moorhouse Agricultural Business Service, Chicago.

'ederal Reserve Big Aid to Business

Manufacturers and Bankers Have Many Interests In Common—Why State Banks Shy at National System

S a business man—manufacturer, wholesaler or retailer—are you consant with the Federal Reserve System? t of any advantage to you in your busi- s? Or don't you know enough about o judge?

Mr. McNally recently spoke before the uthern Division of the Illinois Manu- turers' Costs Association on "The Manu- turer and the Banker." He discussed relationship of business and industry this great financial system the Govern- nt has created, showing the great value commerce and agriculture.

All National Banks are members of this stem—because the Federal law required but many State banks have held aloof. r. McNally discusses this phase of the tuation and shows the additional financial rength possessed by those banks which e backed by the Governmental system.

The following article is the first install- ent of Mr. McNally's address. The sec- d and final installment will be published the next issue of MANUFACTURERS EWS.—Editor's Note.

By R. F. McNALLY

Vice-President and Cashier,
National Bank of Commerce,
St. Louis, Mo.

I

I CANNOT help but think that after all the manufacturers and bankers have very much in common. During the past few years, especially the eriod about three years ago, it was hard o tell where the "common" part began nd where it ended. Practically all the ankers were manufacturers in one way r another and some of those bankers still wn these manufactories, or have other npleasant souvenirs in the shape of harge-offs. But, leaving aside the un- leasant recollections and experiences of he past few years, we have been enlight- ned by the tests and trials through which we have passed and which have pretty learly demonstrated that caution is a good hing.

It is like the man who was out driving with his wife. She noticed that he drove his car with special care and every now and again he would turn out even for the humble Ford and give it all the road it wanted. She stood it as long as she could and finally, turning to her husband, she said, "I never saw you drive this way before. What made you get this way?" He said, "The other day I read an epitaph and I have been thinking about it ever since. It ran something like this:

> "Here lies the body of William Jay,
> Who died defending his right of way.
> He was right, dead right, as he sped along.
> But he's just as dead as if he'd been wrong."

So, I sometimes think that periods like the last few years are bound to come as conditions change. Anyway, they give us something to think about and it is up to us to give the practical application to the lessons taught because I sometimes feel that there is so much casual, careless thinking in this day and age that we do not always get beneath the surface like we ought. It is like the girl who was entering the agricultural college and at examination time when the questions were put before her one of them was, "Name three kinds of sheep." After some deliberation she wrote down, "Black sheep, white sheep and hydraulic rams." There is no question but what mistaken notions will creep in and banking seems to suffer from this more than any other line of business.

When I was in a bank in Northwest Missouri, we held a farmer's note that through renewals had been there a long time. It was one of those cold storage notes. We had often urged payment to the signer of the note, so finally one day, thinking we had given him time enough, I wrote him a letter and said:

> "This is to advise you that your note is again due. Since we expect payment, we are not going to renew it. We hope we have made our position clear in this matter as we feel we have carried this note long enough."

His answer was:

> "Dear Sir: I received your letter and you have made your position perfectly plain. I will be as kind to you as you have been to me. This is to advise you, therefore, that if you don't want to renew it I have concluded to renew the damn thing myself."

And he did; and in the interest of truth and science I would like to record that the note was met at its next maturity.

There was an item in the papers recently, which, after you got through the important murders, scandals, politics, football and other matters of importance, if you kept on reading until you got away back beyond the advertisements, told of a visit made to this city by a committee of Congressmen. As you know, the last Congress provided for a Joint Committee of the Senate and the House to investigate why the Federal Reserve System is not more popular than it is. Out of 30,000 banks in the United States, there are 8,000 National banks. Of course, National banks had to join or give up their charter; therefore, they came in willingly or not as the case might be; but out of 12,000 State banks eligible for the System, only 1,600 have joined and they are chiefly in the larger cities.

Here Is The Question

The question that agitated Congress was. "Why did not the eligible banks in the smaller towns join the Federal Reserve System?" So this Committee was appointed to take testimony in Washington and after they had sat there for some time, they concluded it would be better to go to the people, so they made a tour of the country and tried to reach the various regions where they might get new thought that would clear up that important problem—why do not more banks join the System?

They came to St. Louis and held a hearing which lasted all day, to which the papers devoted half a column, in spite of the fact that I daresay there is no single agency more important to you as manufacturers than this very Federal Reserve System. And, furthermore, if it is to be an entire success, it should have more eligible banks in it and, finally, that it is not a banking question pure and simple in which the banks are solely interested, but it is one of vital interest to the customer of the banks and especially the borrowers from the banks, in which class nearly all manufacturers find themselves at one time or another.

I am now going to ask you how much thought you are giving to the preservation

Epigrams on Federal Reserve System

THIS System was created primarily for the commercial and agricultural interests of the country."

"During the post-war period through which we have passed, this country would have had the worst panic in its history—and in 1873, 1903 and 1907 we had some very stormy panics."

"Right now, without this System, this country would be in the position of England with a depreciated currency."

"This System has enabled us, after a war with unprecedented economic effects, to get back on a gold basis."

"With such facts before us, who will say that the System is not worth while, and is not entitled to the consideration of every interest in the United States."

"Why has not this System sold itself to the banks? Because this System has not sold itself to the country at large, for the people do not know enough about it and cannot understand what it is doing for them."

of the Federal Reserve System? Last November marked the ninth anniversary of the System; it was established nine years ago under an act of Congress that provided that the System should last for twenty years, and at the expiration of that period unless Congress passes an Act providing for its renewal, the System will go out of existence. Almost half of that time has elapsed and it does look as though when anybody has anything to say by way of criticism they can always get the front sheet of the paper, but when anything of a creditable nature is done by the System, nobody ever hears anything about it.

Now, this is what it means to you as manufacturers. When you open your account at a bank it is generally arranged that a definite line of credit is established; a manufacturer's account is nearly always a borrowing account and is so regarded. One test of good paper is whether it is rediscountable. This was unheard of prior to the establishment of the Federal Reserve System, which formulated certain regulations providing for rediscountability. In effect, it meant that good paper, in time of distress, could be sold by a member bank to the Federal Reserve Bank with the member bank's endorsement, thus enabling that bank to take care of its customers in a way that would not have been before possible. It may not come to pass that a bank will have to use its rediscountable paper but it is a comfortable thing to feel that it is there and can be used when need may arise.

This System was created primarily for the commercial and agricultural interests of the country and the framers of this law were particularly anxious that these two classes should be favored. It was even stipulated that loans secured by bonds and stocks, excepting Government obligations, should not be eligible for rediscount. This shows how vitally you are concerned in the operations of the System.

I will go farther and state that it is the opinion of bankers who have given the matter any thought at all, that during the post-war period through which we have passed, this country would have had the worst panic in its history—and in 1873, 1903 and 1907 we had some very stormy panics. Right now, without the System, this country would be in the position of England with a depreciated currency. This System has enabled us, after a world war with unprecedented economic effects, to get back on a gold basis. With such facts before us, who will say that the System is not worth while and is not entitled to the consideration of every interest in the United States?

When I appeared before the Committee in Washington on behalf of the Reserve City Bankers Association, composed of bankers in the larger cities, the question was asked me, "Why has not this System sold itself to the banks?" My reply was that this System has not sold itself to the country at large, for the people do not know enough about it and cannot understand what it is doing for them.

Capacity Production In All Industry Is Goal Sought by Elevator Official

TIME was when the mental equipment of the manufacturer and business man necessary for the conduct of his affairs was a thorough knowledge of the details and technique of his product. But not so with your modern manufacturer. With his product being distributed all over the earth he has to know something about the whole world, for the whole world is his market.

Anything beyond a superficial knowledge of world or foreign affairs used to be left to the diplomatists. That was their profession. For instance, the late Sir Cecil Spring-Rice, British War Ambassador at Washington, could talk understandingly of the political and domestic affairs of any nation just as freely as the ordinary man might discuss the ward politics of his city.

E. A. Russell

But a large percentage of men at the head of great manufacturing establishments are men familiar with other nations. Take E. A. Russell of the Otis Elevator Company. Mr. Russell can sit down with you and reel off figures on the tensile strength of a 1-inch cable, tell you the number of strands of wire in the cable, show you the horse power necessary for a battery of six elevators. On with equal facility, he will discuss with you the situation in China and Japan, express the hope that Dr. Masaryk, President at Prague, will weather the present difficulties in Europe, or he will frown over the opportunist tendency of the Liberal party in Persia.

Mr. Russell's goal is capacity production, a condition which, if attained by every great manufacturing concern, would mean the apex of prosperity. That is the mark he has set and which he feels is warranted by the destiny of the country.

Mr. Russell, by the way, is one of the new Directors of the Illinois Manufacturers' Association.

Big Lighting Firms Merge As Curtis Lighting, Inc.

Curtis Lighting, Incorporated, is a new grouping of three nationally and internationally known firms—the National X-Ray Reflector Company, the X-Ray Reflector Company of New York, Inc., and Luminaire Studios, Inc., of New York and Chicago. Augustus D. Curtis is President of the consolidated interests which represent probably the largest organization devoting itself exclusively to the engineering, designing and manufacturing of specialized lighting equipment.

The National X-Ray Reflector Company, oldest of three associated companies, has for the last twenty-nine years been engaged in the manufacturing of silver-mirrored reflectors for controlling and directing light for all purposes of exterior and interior lighting.

The successes attained in this field induced Mr. Curtis and his associates to investigate the possibilities of applying the principle of lighting from concealed sources to other branches of illumination, and in 1908 he demonstrated how light could be directed to the ceiling and diffused, thus affording a soft, general illumination in the place of the harsh, glaring light from the unshielded high-powered lamps.

Luminaire Studios, Inc., have made special contributions to the success of Curtis lighting through the designing and construction of artistic luminaires to inclose the indirect lighting equipment—simple, appropriate, beautiful luminaires that would enhance rather than detract from the architectural beauty of an interior. The magic whiteness of the Wrigley Tower at night, the beautiful colored lighting effects obtained in many of the theatres, the innumerable installations that add to the attraction of banks, offices, public buildings, churches, lodges and residences are representative of the broad scope and activity of Curtis Lighting, Incorporated.

These three companies, since Feb. 1, have been located in the new Curtis Building at 1119 West Jackson Boulevard.

Cigar Tobacco Increases

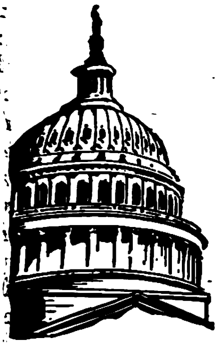
Production of cigar types of tobacco last year was 195,788,000 pounds as compared with 175,001,000 pounds in 1922, says the United States Department of Agriculture. Production of cigar tobacco increased in all tobacco-growing States except Ohio, where the crop decreased around 750,000 pounds.

ongress Runs Wild With Politics

Good Legislation Is Jeopardized by the Uproar in Both Parties—President Stands Squarely for Mellon Plan

By JOHN M. TOWNSEND

Washington Correspondent,
Manufacturers News



Washington, D. C., Feb. 13.—Congress is running wild with politics. Every measure now pending or proposed for consideration is being scanned, dissected and weighed from standpoint of political considerations ad of merit. Political investigations ien and measures have the right of way he legislative mind. The outlook for l legislation by this Congress is not t it should be. President Coolidge's stence on tax reduction legislation is only saving grace in the situation, but that measure is jeopardized in prin- e by politics.

OLITICS RAMPANT—Bi-partisan dis- ures involving members of both parties he Senate oil scandal investigation has ved to whet the appetite of Congress for itics rather than to subdue it. Con- ss has not been in such a political frame mind in many years. Even the Immi- tion Bill, proposing to reduce the pres- quotas of immigration by half as a manent immigration policy, and to pro- e for selective immigration, may fail passage on the political ground that it dangerous legislation to be considered a presidential campaign year. Ten days no such suggestion was heard, and s incident may be accepted as typical political conditions in the Congress on broad legislative questions. On tax islation, the Democrats are preparing make the most of any opportunity which y arise to embarrass the Republican ma- rity. With the back door wide open r a hasty exit, if necessary, the Demo- ats are preparing to make all the politi- l capital possible against the Mellon an, to amend it if they can but to avoid semblance of responsibility which ould go with a defeat of tax reduction gislation in the face of an almost unani- ous demand of the country for it. Never- eless, the Democrats remain fearful of e possible effect of a strong veto mes- ge from President Coolidge if they olate the principle of the Mellon Plan o far, hence their caution in procedure.

COOLIDGE TENACITY—In his speech efore the Republican Club in New York, resident Coolidge has again revealed to e country the "stuff of which he is made." o matter how much politics may intervene the consideration of tax reduction legis- ation, the President has secured a strangle old on Congress which compels it to pass ome kind of a tax reduction bill at this ession. Without this grip, backed by public support, it is doubtful whether tax reduction legislation could be passed by this Congress because of the political divisions within it. At the same time, the President is coolly standing pat on the Mellon Plan, calmly arguing its merits apart from all politics, thereby imposing on the Congress the responsibility which must accompany any failure to deal fairly with such an important legislative proposition. On the whole, Congress is rather fearful of this grim aspect which the President presents on the tax question, and therein lies the only possibility that tax reduction legislation can emerge with any semblance of merit in it. Despite the blow and bluster of the politicians who are to do the legislating, an eagle eye is being kept on the man in the White House who will have the last say on any tax reduction bill passed by this Congress. It is the Democratic plan to attack the Mellon Plan on the ground that it is part and parcel of the policy of a Government which favors big business as against the common people, part of a plan emphasized by the Tariff Act, by the oil leases and other administrative acts of the Administration which, from the Democratic viewpoint, go to prove their contention. If, in the public debate in the House, the Democrats fail to make political headway with these tactics, few of them will be found voting against a real tax reduction measure on the final roll call.

PRESIDENT COOLIDGE'S WORKSHOP
Chief Executive in His Office in Executive Building, the White House

PUSSYFOOTING — When a majority of the Republicans on the House Committee on Ways and Means voted to report the Mellon Plan almost intact to the House, it is noteworthy that the Democrats voted "present" instead of voicing their unqualified opposition to the measure. This strategy leaves the Democrats absolutely free to take any position on the Bill hereafter that opportunity may offer. They will oppose the Bill in the House, asking a vote on their substitute bill, the Garner Plan, both in detail and as a whole, and they will have a second string to their bow in the form of other amendments upon which they will place their main reliance. In fact, as the debate on tax legislation proceeds in the House, it will surprise no one to see both the Republican and Democratic plans for tax reduction modified by majority votes in the House. It is well known that Chairman Green, who reported the Republican bill to the House, does not favor it as it stands. Mr. Green is one of the open advocates of a maximum surtax rate of 35 per cent, and still favors such a compromise. There are other Republicans, notably among the Farm Bloc to which he belonged, who agree with him. At the same time there are many Democrats who do not favor the 44 per cent maximum surtax provided by the Garner Bill which, however, the LaFollette Progressives in the House are more likely to favor than a compromise on the Green plan. There is no doubt about it that, as the Tax Reduction Bill comes before the House, political lines are trembling and that a free-for-all contest along political lines is in sight. The Democrats have kept the door wide open for a retreat if their aggression fails, while the bulk of the stiff-necked attitude on the Republican side comes from a belief in the principle of the Mellon Plan, enhanced by the determination of the President.

OIL DEVELOPMENTS—President Coolidge knows of no resignations from his Cabinet, either pending or contemplated. Regardless of the attitude of the Senate relative to the propriety of asking Secretary of the Navy Edwin Denby to resign, there is no indication yet that President Coolidge proposes to act on that subject until there has been a judicial determination of the questions at issue, both criminal and civil. In the Democratic mind, Mr. Denby stands convicted only of incompetence for agreeing to the transfer of the Naval Oil Reserves to the Interior Department, for consenting to their exploitation by leases to private companies and for making a contract for oil storage tanks

Why not a profit—instead of a loss on your rags?

Forty-nine tons of rags saved in a single year was the record made by one big printing plant with its Troy Rags and Waste Reclaiming System.

How many *Tons* of rags ($) a year are you burning each year?

Our equipment will enable you to *re-use your rags* many times—thereby showing you a *profit* where a loss now exists.

Are you burning your rags, simply because they are grimy, dirty, or oil soaked, when we can show you a far better and more profitable disposition of them by our Reclaiming System?

without specific authorization by Congress. On the contrary, the Republicans in Washington who have studied the oil leases, are coming more and more to believe that Mr. Denby was right in preparing the Navy for the possibility of an early war with Japan, which appeared more imminent in the early days of the Harding regime than it does now; that he was justified in turning over the leases to the Interior Department which handles 99 per cent of the Government's land holding and has an adequate staff to administer and operate them, and that the leases are, in fact, just what Mr. Denby says they are, the best of the kind ever made by the Government and better than it could make again. These considerations, of course, are arrived at without reference to the predicament in which Albert B. Fall finds himself as a result of the Doheny loan. On the other hand, William G. McAdoo finds himself in somewhat of the same position as Mr. Denby, although on different facts with a different application. Nobody here thinks Mr. McAdoo did anything affecting his private reputation. He did nothing he did not have a right to do personally. As a presidential candidate, however, Mr. McAdoo's standing has been hurt temporarily, perhaps permanently. Therein lies the rub.

ILLINOIS TAX PAYMENTS—For the fiscal year 1923 the State of Illinois paid into the Federal Government Treasury, internal revenue taxes amounting to $232,800,023.57. Of this amount $176,942,226.88 was for income taxes and $55,857,796.69 was for miscellaneous taxes. The First District of Illinois, including Chicago, paid in $167,689,811.39 in income taxes and $48,358,366.72 in miscellaneous taxes, a total of $216,048,178.11. The Eighth District, downstate, paid $9,252,415.49 in income taxes and $7,499,429.97 in miscellaneous taxes, a total of $16,751,845.46.

Reorganization of Consular Service Will Benefit U. S.

Representative John Jacobs Rogers of Massachusetts, majority member of the Committee on Foreign Affairs in the House of Representatives, before the adjournment of the Sixty-Seventh Congress, introduced a bill designed to strengthen and improve the diplomatic and consular service by remedying the chief defects which now seem apparent. The bill passed the House, but was not considered by the Senate before adjournment.

It is designated as H. R. 17, and provides for the reorganization and reclassification of diplomatic secretaries and consuls in such a manner as to give the United States Government a flexible service and to accord to career men in the diplomatic service salaries comparable to those paid to consuls of corresponding grades.

The United States Government never has paid its foreign diplomats anything compared with the salaries of other nations. The American Ambassador to Great Britain, for example, receives $17,500, while the British Ambassador to the United States receives $97,330 and in addition has a handsome residence in Washington, whereas our Ambassador to the Court of St. James has to live in a rented apartment. On account of the low salaries it has usually been customary for the United States Government to appoint only men of wealth to diplomatic posts.

Under the Rogers Bill a new and uniform salary scale is provided, and the diplomatic and consular branches are amalgamated into a single foreign service on an interchangeable basis.

It has been estimated that the benefits which the Rogers Bill proposes, including increases in salaries, the provision for retirement annuities and representation allowances, will entail an initial increase over present expenditures of the State Department not to exceed $375,000.

Commenting on the Rogers Bill, Representative W. F. Lineberger of California, former member of the House Committee on Foreign Affairs, said:

"As the Department of State is the one department of the Government that comes nearest to paying its way, because of the consular, shipping and passport fees it collects, this added expense to the Government is trivial, when compared with the benefits that naturally would accrue to the American people."

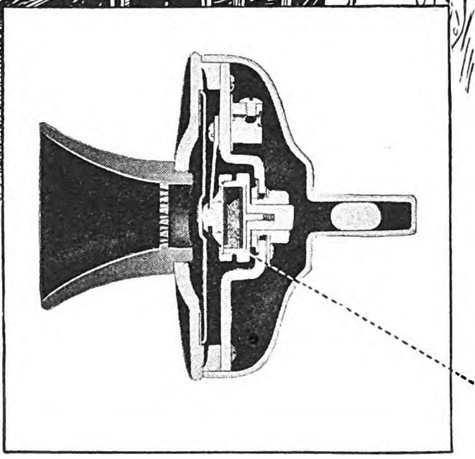
Wilson & Co. Offers Stock to Employes In New Plan

Wilson & Co., one of the big meat packing concerns of Chicago, is arranging for new financing which will include an opportunity for employes to increase their stock ownership in the Company. A meeting of the stockholders of the Company to ratify the plan has been called for Feb. 27. According to the official statement issued, the plan proposes the creation of two new classes of stock, one a prior preference, and the other a Class "A" having preference over common stock to the extent of receiving non-cumulative dividends at rate of $3 per share in any year before dividends are paid on the common stock; the common stock then to be entitled to receive dividends up to $3 per share. The Class "A" stock and common stock thereafter to share and share alike in the dividends for the year.

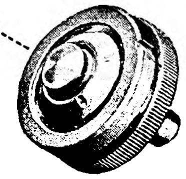
It is also planned to authorize an issue of 250,000 shares of prior preference stock of no par value, which will have preference up to $115 per share in case of liquidation.

Geneva Optical Head Dead

Fred H. Smith, President of the Geneva Optical Company, died recently at Miami, Fla. Mr. Smith had lived in Chicago for thirty years. He resided at 1329 Glenlake Avenue, and is survived by his widow, Mrs. Susan Reed Smith; two sons, William H. and Reed Harmon Smith, all of Chicago; and a daughter, Mrs. Isabel Hart, of East Orange, N. J.



This is the carbon button, in which treated grains of coal are placed. Vibrations of your voice cause these grains sometimes to bunch, sometimes to touch each other lightly — offering a constantly changing path for the voice currents.



The telephone transmitter in cross-section. Your voice sets up vibrations which are carried through the treated coal particles; thence as electric currents over the wires

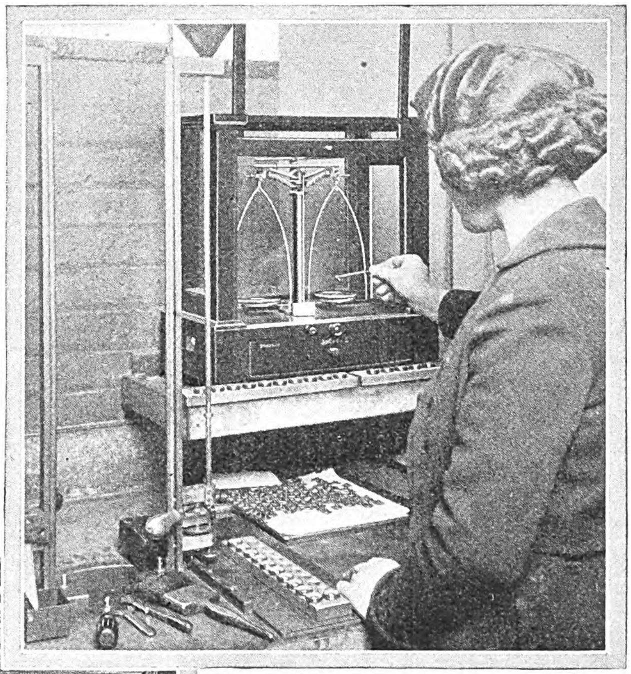
Coal
– in your telephone*

Coal, selected with painstaking care and subjected to a series of special treatments, becomes in the transmitter the very vocal chords of the telephone.

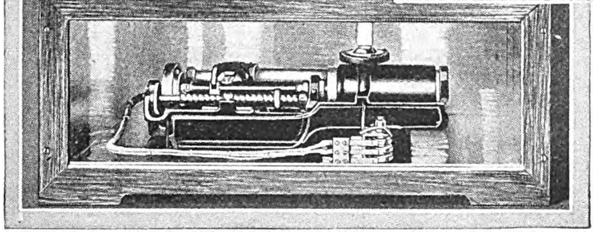
This treated coal offers a means of translating into electrical impulses the vibrations of the voice and even the inflections and mannerisms peculiar to any one voice.

Skill of a high order is essential in making the carbon button and indeed all of the 201 individual desk telephone parts. This craftsmanship has been a Western Electric standard ever since 1877.

**No. 7 of a series on raw materials.*



Weighing the grains of coal that go into the carbon button. A skilled operative, using a chemist's delicate balance, checks the amount which this button contains.



To make sure that the carbon button is filled right and that the whole transmitter has been properly assembled, phonographs like this repeat the phrase, "1, 2, 3, 4, 5," many thousand times into the mouthpiece.

SINCE 1869 MAKERS OF ELECTRICAL EQUIPMENT

Legal Opinions on Industrial Questions

BY COLIN C. H. FYFFE

General Counsel, Illinois Manufacturers' Association

QUESTION—

A firm contracted with a furnace company to install a heating and ventilating plant in its new factory. The contract provided that the work would be completed and ready for use by a certain date. The Company states that the work was not completed at the time provided in the contract and that as a consequence it has been prevented from using its new factory, and has suffered a loss as a result. It is asked whether damages can be recovered from the furnace company.

ANSWER—

Where any person contracts to complete the part of a bulding covered by his contract by a certain date, and through no fault of the owner or his representatives the work is not completed by that date, the owner can recover damages for the breach of contract. The measure of damages is the value of the use of the building from the time it should have been completed until it was in fact completed. If the delay is caused by some act of the owner or his representatives, or the owner has waived the breach which consists of the delay, he cannot, of course, recover damages from the contractor.

QUESTION—

Must a foreign corporation which employs traveling "missionary" salesmen within a state comply with the foreign corporation laws of the state? By "missionary" salesmen is meant salesmen who sell the goods of the home concern to jobbers in the foreign state, and then seek to sell these goods from the jobber to the retailer.

ANSWER—

In the case of *Cheney Bros. v. Massachusetts, 246 U. S. 147 (case of Northwestern Consolidated Milling Company)* the Supreme Court of the United States held that a foreign corporation which employed salesmen within a state to solicit orders from retailers within the state and turn them over to wholesalers in the same state, was engaged in intrastate business within the state, and subject to the foreign corporation laws of that state.

QUESTION—

On June 8th, 1923, a company made a shipment to a purchaser of certain goods. In one of the crates was strapped a carton containing merchandise to the value of $66.75 which was never received by the consignee. The Company replaced the merchandise and claim for damages was entered with the Railroad Company by the consignee. The consignee claims that the crate was received in first-class condition, and the Railroad Company has refused to honor the claim because the consignee did not request an inspector to inspect the shipment at the time it was received. The consignee is pursuing the claim in a half-hearted manner, and the Company would thank you for an opinion as to how to proceed on our part in presenting a proper claim to the Railroad.

ANSWER—

It does not appear from the letter of the Company whether the shipment was made at the risk of the consignee or whether it was made at the risk of the consignor. This would depend upon the terms of the sale. In the absence of other facts a sale F. O. B. the place of the shipment, would be at the risk of the consignee or purchaser, and the shipment F. O. B. destination would be at the risk of the consignor or seller.

If the shipment was made at the risk of the purchaser, then the seller is entitled to recover from the purchaser the value of the goods replaced, and the claim against the carrier for loss is that of the purchaser, and any recovery from the carrier should be by the purchaser for its own account. Under such circumstances, however, the seller can prosecute the claim against the carrier on the contract of shipment, but for the benefit of the purchaser.

If the claim is that of the seller the claim should be made by it, and it only can look to the carrier for any loss it has suffered on account of merchandise lost in transit. Claims must be filed in writing within six months after delivery of the property, or in case of lost property, within six months after the time when the shipment should have arrived. In case it is necessary to bring suit against the carrier, suit must be brought within two years and one day after delivery, or in case of lost goods, within two years and one day after goods should have arrived.

In the particular case referred to, if the shipment was made at the risk of the purchaser the Company should collect from the purchaser the value of the goods replaced, and leave the purchaser to its rights against the carrier. If the shipment was made at the risk of the seller the Company should disregard the claim filed by the purchaser and should file its claim against the carrier on its own account.

The matter of inspection, or the request for an inspector, upon the loss being discovered, is simply a matter of proof. The claim may be proved even though no inspector had been called in at the time the loss was discovered, providing there are sufficient facts to sustain the claim of loss. The only advantage in calling in an inspector is to simplify the proof of loss.

A claim for loss against a carrier need not be in any particular form except that it must be in writing.

Paper Output in 1923

Figures compiled by the American Paper and Pulp Association in co-operation with affiliated organizations of paper manufacturers indicate that the total production of paper of all grades in the United States in 1923 was approximately 7,200,000 tons. This total is larger than the production of any other year in the history of the industry, except 1920, when the total was 7,334,614 tons. It is somewhat larger than the production of 1922, which was 7,017,800 tons.

Employers Asked to Help Workers With Tax Reports

Mrs. Mabel G. Reinecke, Collector of Internal Revenue, Chicago, has issued the following statement to employers of labor relative to making out the income tax blanks of the Company and also the personal returns of their employes:

"There is a misunderstanding on the part of many persons regarding their liability in filing income tax returns. The law provides that a married person receiving an income of $2,000 or more is required to file an income tax return even though his personal exemption is $2,500 or over and even though there is no tax to pay. A single person is required to file an income tax return if his income is $1,000 or more although his personal exemption relieves him of paying a tax.

"It has been found in checking over Form 1099, information reports sent to this Department by employers showing the amount of money paid employes, that in a great many instances it has been necessary to call these persons into this office because they had misunderstood the income tax law and oftentimes it has been necessary to exact the payment of a penalty because of the liability they incurred by failure to file a return. This causes great inconvenience to the employer as well as to the employe and often loss of time. It is the desire to eliminate this condition as far as possible by making a special effort to have all persons in this District informed of the provisions of the income tax laws in this respect.

"In this endeavor, I earnestly solicit your co-operation and request you to post the following bulletins in your place of business where they may be readily seen by your employes:

MARRIED PERSON

"If your income is $2,000 or more it is necessary that you file an income tax return. The fact that you are married and have children does not relieve you of this liability. Therefore, if your income is $2,000 or over you should file an income tax return even though your personal exemption and credits leave no tax to pay.

SINGLE PERSON

"If your income is $1,000 or more it is necessary that you file a return. The fact that you are allowed exemption as head of family, or exemption for support of one or two relatives, does not relieve you of this liability. Therefore, if your income is $1,000 or more you should file an income tax return."

Thompson Heads Trade Commission

Commissioner Huston Thompson is the new Chairman of the Federal Trade Commission, succeeding Victor Murdock. The appointment of Mr. Thompson to the Chairmanship follows the Commission's custom of rotating the chairmanship among the commissioners. He will serve one year. Mr. Thompson was formerly an Assistant Attorney General, is a Democrat and has been with the Commission since 1919. This is his second term as Chairman, he having served in 1920-1921.

Selective Immigration Gains Ground

Johnson Bill in Congress Favors Nations of Northern Europe—Fear Exclusion May Injure American Industry

By CHARLES WARNER

Written for Manufacturers News

THE conviction is gaining ground that legislation on the immigration problem should be aimed at the perfection of a selective individual process, ther than radical discrimination. The blic already knows that the Johnson ll, now pending in Congress, favors the rthern peoples of Europe as against the ces in the Southern section of that conent. The argument is offered that the ordic races assimilate in greater numbers an do those of the South.

Regardless of the effect of the Johnson ill on this or that nation's quota of imigrants, sentiment is unanimous among e people and in Congress that the bars gainst undesirables and paupers should e kept up. The fact is not generally nown that our government itself provides course of training in the essentials of merican citizenship for those who come ere ignorant of American history, usages nd customs. The instrumentality referred is the Americanization Division of the epartment of Labor. In all large cities f the land, and even in towns of medium ize, night schools for the training of inending citizens are maintained by the epartment. Men and women immigrants rom all the countries of Europe, except ossibly Turkey, attend these night schools.

Men and women who work all day, and ho are so eager to learn the principles f American citizenship that they are glad o give their evenings, are considered by he Department the most desirable class of immigrants who come here.

In the Winter of 1918-19, at the direction of Secretary of State Lansing, the writer arranged in the State Department library in Washington an exhibit of the sacred documents of which the Secretary is custodian. The engrossed copy of the Constitution and also the Declaration of Independence were the center pieces of this exhibit. The school children of Washington, members of Congress and the Diplomatic Corps were invited, and, finally, it was decided to extend the invitation to the Americanization group of the city. Washington at that time had a class of some 160 men and women immigrants in its night schools. On a fixed evening these people marched with their teachers to the State Department. They entered the library, where the great sheets of parchment of the Constitution and the Declaration of Independence were displayed, with all the solemnity and reverence characteristic of worshippers entering a church. And they stood respectively attentive while the great state paper was explained to them.

And now most of these people from other shores, who enjoyed the privilege of seeing the very documentary heart of America, are naturalized citizens.

The foreign language press of the country, as a rule, urges its nationals to take out citizenship papers. Notably has the *Greek Star,* of which Peter Lambros is Editor and Publisher, been strong in its arguments and preaching of Greek assimilation. The *Star* takes this position in an editorial published long before the present agitation opened:

Preaches Naturalization

"Our love for Greece, the Mediterranean country where the warm sun first shone on us, is indeed great; still we can confidently say that nothing could be farther from the truth than the supposition as if this justified sentiment of ours were infringing on our loyalty to America, the country of our adoption. In our opinion not that man should be feared who bears in his bosom an affection for two countries, but he who does not love any country.

"We know only too well, and have said and written it many times, that it is the obligation of all Greeks to do whatever they possibly can to promote the welfare of the country which receives them so hospitably and treats them with a liberality unknown anywhere else. They should qualify at the earliest possible moment to become citizens of the Great Republic, so they are fully able to identify themselves with her. They should remember that no other country grants this right of citizenship for people of foreign birth. Thus, in France and also in Germany and elsewhere citizenship is regarded as an inherited privilege. To become naturalized as a Frenchman is almost an impossibility.

"America has shown herself especially grand during the last few years in contrast to her associates in the war. She alone of all countries has disdained any such thought as stripping the conquered. Unlike the others, she fought for an ideal and contented herself with overthrowing the political system of her opponent, but did not choose to cast him into economical or political bondage or to trespass on him geographically.

"Our hearts swell with pride at the 'Star-Spangled Banner,' when we reflect on the fact that it belongs to a nation which waged a great war merely for liberty's sake; which, as a nation, shows the same humanity that is so characteristic of well bred individuals and consists in being kind even to those who are weaker than we, or not our equals in fortune and station.

"To be or to become Americans, what a privilege! What a glory it is to belong to the foremost Commonwealth of the world, not only in power and resources, but in all the acts of peace; to be able to say that we, too, may share in the pride of calling Washington, Lincoln, and Franklin our own!"

Oscar Durante, Editor of *L'Italia,* believes that the proposition to limit the immigration quotas still further is not prompted by good faith, at least so far as the Italians are concerned.

"The advocates of this plan to put up the bars," he said, "will argue and present every reason they can think of why immigration should be curtailed further, but they will not come out in the open and express their real purpose. It is a religious fear they have, that if the tide of immigrants from Roman Catholic countries is not stemmed the United States some day might elect a Roman Catholic President and Congress. Now, we know the Constitution guarantees freedom of religion, and it is deplorable to see it dragged into politics and public affairs. These people would be glad to have all Italians shut out, not because they are Italians, but because they are Roman Catholics."

There is a well grounded belief among business men that the prevailing tendency toward recession from the melting pot idea may be carried to extremes; that the exclusion of paupers, criminals and other undesirables is one thing, and that the exclusion of industrious classes is quite another. The industrial world, and the manufacturer in particular, needs workers, and for that reason there is a fast-growing fear that the policy of exclusion might be carried to the point of embarrassing American industry. The problem of providing workers for the future, in view of the fact that apprentices in all lines of trades and crafts are growing scarcer each year, is regarded as a serious one.

Senator Reed's Substitute

Senator Reed of Pennsylvania has proposed as a substitute for the impending Administration measure an immigration bill which will permit admission to this country of European arrivals by percentum, based upon the naturalization of immigrants during their residence in this country. He objects to the census of 1890 as the basis for the establishment of quotas, and proposes that the census of 1910 be taken as the basis, that immigrants be admitted up to 5 per cent of those admitted in 1910 from the countries, 50 per cent of whose arrivals have become naturalized citizens, and that only 2 per cent of the arrivals from those countries whose immigrants do not assimilate and become citizens be admitted.

TRANSPORTATION

Eastern Railroads Plan Unprecedented Development of Motor Trucks in 1924 for L. C. L. Short Haul Tonnage

PLANS are now being made by a number of railroad lines, especially in the East, for an unprecedented development in the use of motor trucks during 1924 to aid railroad operation and supplement the work of the carriers. It will be attempted by several lines to carry as much as possible of less than carload short haul tonnage by trucks operated by outside companies having agreements with the roads following completion recently of several successful trials.

Through the use of trucks, it is said by executives especially interested in this phase of railroad operation, the main lines can be made to produce more ton miles of transportation, which is the rail criterion of profitable railroad operation. Miscellaneous less than carload freight is very expensive to handle and slows down the movement of freight generally when it is carried for short hauls.

The use of the truck will be tried primarily in the Eastern territory during the next year. The Boston & Maine has tried a number of experiments in recent months which are understood to have met with success, and, as a result, it will put into operation a fleet of trucks next year in carrying freight formerly hauled by the railroad at an unjustifiable expense. The Pennsylvania has already taken the lead in this work, utilizing trucks in transporting miscellaneous freight between Philadelphia and Wilmington, Del., two points on its direct line to Washington.

The use of trucks, it is understood, has been found profitable both in crowded terminal zones and in rather thickly settled territory, outside of regular terminal zones, between two points exchanging general freight to any extent at all. Another important use of the truck is to switch freight from one road to another at junction points, it proving more economical to use trucks than to actually transfer cars in a number of cases.

How Railroads Eat Up Steel

The amazing extent to which railroad buying dominated steel consumption during 1923 is told by E. C. Kreutzberg in *Iron Trade Review.*

Of the steel shipped by American mills during the year nearly 31 per cent went directly or indirectly into railroad consumption. Based on reports from 73½ per cent of the industry, the calculated consumption by the railroads was 9,437,235 tons, of which 4,498,600 tons went into cars and locomotives, 3,943,540 tons into railroad track work, 742,100 tons into railroad buildings and bridges and 185,920 tons into machinery and hand tools for the railroads. The railroad consumption of steel in 1923 shows a gain of 66½ per cent over 1922, when the roads took 5,667,000 gross tons.

Total shipments of structural steel comprised 15¾ per cent of all the steel shipped during the year. The total structural consumption was 4,835,900 gross tons, which included 742,100 tons for railroad structures and 4,093,000 tons for all other buildings and bridges. Structural consumption of steel in 1923 was 51½ per cent greater than in 1922, when structural requirements absorbed 3,079,350 gross tons.

Consumption of steel for the production and transportation of oil, gas and water, not including pipe in buildings, took nearly 11 per cent of the steel shipped in 1923. The total was 3,314,900 gross tons, which compared with 3,384,450 tons in 1922, or a decline of about 2 per cent.

Requirements for the automotive industry, comprising automobiles, motor trucks, tractors, etc., took over 10 per cent of the 1923 shipments, or 3,094,100 gross tons. This compared with 2,048,500 gross tons in 1922, or a gain of 51 per cent.

The figures are compiled from the reports of producers controlling 73.52 per cent. of the country's ingot capacity, which compares with 70.88 per cent. for 1922.

Johnson Heads Traffic Committee

A. C. Johnson, Vice-President of the Chicago & Northwestern Railway, has been elected Chairman of the Western Traffic Executive Committee, succeeding C. E. Spens, Vice-President of the Burlington road, resigned. The Committee is the ranking committee dealing finally with all traffic matters affecting the entire West.

Facts About Railroads in U. S.

Here are some interesting facts about the railroads of the United States, most of the statistics given being from reports of the Interstate Commerce Commission:

260,000 miles of main-line trackage.

$21,000,000,000 invested in equipment and property.

1,933,929 persons employed in June, 1923; total compensation for the month, $259,127,789.

American railways own 69,000 locomotives, 2,500,000 freight cars, and 60,000 passenger cars.

$6,000,000,000 earned as operating revenues for 1922 for Class I railroads, i. e., those having annual operating revenues in excess of $1,000,000.

$300,000,000 in taxes were paid in 1922 by Class I roads.

374,000,000,000 (approximately) net ton-miles were traveled on Class I railroads during 1922.

35,200,000,000 (approximately) passenger-miles were traveled on Class I railroads during 1922.

3.02 cents were received for a passenger-mile by Class I railroads during 1922.

1.2 cents were received for every ton-mile by Class I railroads during 1922.

Classification of employes as of June, 1922:

601,000 maintenance of equipment and stores.

446,000 maintenance of ways and structures.

341,000 train and engine service.

287,000 professional, clerical, and general transportation employes other than train and engine service.

26,000 yardmasters, switch tenders, and hostlers.

16,000 executives, officers, and staff assistants.

Recent statistics reported by the Interstate Commerce Commission reveal that the railroads employed during July, 1923, a total of 1,954,687 workers, almost 500,000 more than were employed in the corresponding month, 1922.

$261,805,549 represents the wages and salaries paid for July, 1923, against $193,571,244 for the same month, 1922.

French Railways Gain

The Joint Agency of the Railways of France for North America announces that the French railroads continue to show the improvement in earnings during 1923 that characterized their operations in 1922, when only the State and the Southern Systems showed deficits. The report for the period from Jan. 1 to Nov. 11 for gross and net receipts follows:

Railways—	1923.	1922.
State	905,426	852,556
P. L. M.	1,660,600	1,525,500
Northern	1,016,240	972,820
Orleans	852,725	794,919
Eastern	880,801	872,849
Midi	426,885	399,683
Alsace & Lorraine	424,127	420,427
Total	6,166,804	5,838,784

These figures stand for thousands of francs.

Shipbuilding at Belfast

During the calendar year 1923 the two shipbuilding yards of Belfast, Ireland, turned out a total of 127,433 tons of shipping, compared with 86,943 tons in 1922, 93,494 tons in 1921, 116,549 tons in 1920, and 197,826 tons in 1919—the banner year. Of the total for 1923, Harland & Wolff, Ltd., built 86,714 tons, and Workman, Clark & Co., Ltd., built 40,719 tons.

Leads World In Telephones

On Jan. 1, 1922, there were more than one and one-half times as many telephones in the United States as there were in all the rest of the world.

Limitless

No other word applies adequately to the facilities of this organization to serve manufacturers who use wood in making or shipping their products.

In our Chicago yard of 45 acres are piled thousands upon thousands of feet of all kinds of crating lumber.

Your phone call will start your order towards your factory today.

Just as promptly can we furnish maple, oak and yellow pine flooring, heavy timbers, piling, or any wood you need in the production of your goods, in any size or amount.

In Chicago and suburbs a system of twenty branch yards, ably managed and adequately stocked, means quick deliveries and lower delivery costs.

Phone us, wire us, write us for anything any time. Insure your service to customers by having unlimited service for yourself.

FOREIGN TRADE

Foreign Commerce of U. S. Shows 16 Per Cent Increase in 1923 Over 1922, Says Survey by Shipping Board

THE total foreign commerce of the United States, moved by water, in 1923 was 92,957,582 tons, a gain of nearly one-sixth over 1922 when the total was 79,975,229 tons, according to a survey of the water-borne imports and exports of this country for the fiscal year ending June 30, 1923, now in preparation by the Bureau of Research, U. S. Shipping Board. The survey does not include cargo tonnage moved in coastwise or intercoastal domestic trade.

The water-borne foreign commerce of the United States in the fiscal year ended June 30, 1923, was conducted through 163 domestic ports, which, to facilitate analysis and comparison, the Bureau has segregated into four groups. The first group includes those ports whose foreign commerce exceeded 1,000,000 cargo tons; the second, those with a total tonnage of from 500,000 to 1,000,000; the third, all others handling 100,000 tons and over; the fourth, all having under 100,000 tons of foreign commerce. Seventy-five per cent of our total water-borne foreign commerce passed through the fifteen ports which constitute the first or 1,000,000-ton class. They are, in the order of total tonnage, New York, New Orleans, Philadelphia, Baltimore, Boston, Buffalo, Port Arthur, San Francisco, Galveston, Los Angeles, Norfolk, Cleveland, Toledo, Portland, Me., and Portland, Ore. These ports show an increase of 9,800,000 tons, 16 per cent over their 1922 total.

In the second group are nineteen ports, through which 15 per cent of the total 1923 water-borne foreign commerce passed. The total of this group is 2,000,000 tons, 16 per cent greater than in 1922. The third group of twenty-six ports handled 8 per cent of our foreign trade, their total being a 54 per cent (2,000,000 tons) increase over 1922. The 103 ports in the fourth group handled only 2 per cent of our foreign trade and their total is 800,000 tons, 30 per cent less than that of the seventy-six of their number engaged in foreign commerce in 1922.

In a similar segregation of the 136 ports through which our water-borne foreign commerce of 1922 was conducted, 13 ports are in the first group, 17 in the second, 24 in the third and 82 in the fourth.

The comparative figures for 1922 and 1923 show the following total tonnages (in cargo tons of 2,240 pounds):

	1923	1922
Imports:	46,151,798	36,658,232
Exports:	46,805,784	43,316,997
Total commerce	92,957,582	79,975,229

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

ALGERIA—9126, machinery for manufacturing wooden barrels.

AUSTRIA—9091, bakelite (substitute for galaith); calculating machines; paint, luminous; 9095, phonographs, phonograph records; 9127, steel bands for manufacture of pens; 9091, time clocks.

BELGIUM—9125, sugar manufacturing machinery, especially cranes, conveyors, and pneumatic packing machinery.

BRAZIL—9090, burning apparatus for pulverized coal; 9118, medicines, homeopathic.

CANADA—9101, cotton remnants; 9114, steel channels for rubber tires on carriage wheels.

CUBA—9086, water sterilization apparatus.

DANZIG—9119, lard; fats.

DOMINICAN REPUBLIC—9080, shoe findings; shoe manufacturing machinery.

ENGLAND—9111, balloons, toy; 9136, bathing caps; 9111, druggists' sundries, rubber novelties; 9136, sponge bags; 9098, tools, engraving; 9131, vulcanizing fiber, both flexible and otherwise, in red and black sheets, rods, and washers; 9136, wading boots.

FRANCE—9077, seeds, Douglas fir tree.

GERMANY—9124, caustic soda, 50 to 100 tons monthly; 9120, artificial teeth; carborundum grinders, dental; dental apparatus and supplies, including electric boring machinery; 9132, flour; lard; 9120, sandpaper wheels, dental.

HAITI—9138, match-making machinery; match-making accessories.

HONDURAS—9143, aluminum wire; automatic cut-off valves; cast iron hydrants; gate valves; pipe galvanized iron, water.

INDIA—9092, bookbinders' cloths; 9117, caustic soda; 9123, hosiery; 9117, soda ash; 9123, underwear; buttons; 9092, cardboard; 9117, hardware; 9092, leather; paper; stationery; strawboard; slates.

IRELAND—9139, ammunition for shot guns; axes; 9116, building materials; 9140, coffin mountings, silver plated; 9137, California redwood; hardwoods, particularly oak and gum; 9141, oils, lubricating; 9140, oak and sap gum coffin boards; 9116, roofing felts; 9137, Southern yellow pine; 9139, saws—hand and crosscut; shotguns, single and double barrel; 9116, slates; 9137, wallboard, mineral; maple flooring; mahogany, Honduras.

ITALY—9096, wheat.

JAPAN—9089, lignum-vitae.

JAVA—9094, electrical appliances; 9141, galvanized barbed wire; 9094, lighting equipment; telephone equipment; wire gauze, all sizes, copper and iron; 9141, wire nails.

LATVIA—9099, lathes; tools; welding machines, portable.

MEXICO—9144, candle stock; machinery for soap and candle making; potash; soap stock; vegetable oils.

NETHERLANDS—9115, furniture for schools.

POLAND—9107, elevators for grain; milling machinery.

SOUTH AFRICA—9093, bottles, milk; 9129, confectionery; 9093, dairy equipment; 9105, magnesium chloride, 10 to 20 tons a month.

SPAIN—9113, corn; 9088, stoves, oil, for heating and cooking.

STRAITS SETTLEMENTS—9128, aerated water-making plant; ice-making plant; refrigerator vault.

TURKEY—9110, cotton and woolen goods; enameled cooking utensils; hosiery; hardware; paper—wrapping, packing, newsprint, letter, and adhesive; stationery; suitings.

Seeks Export Trade

F. L. Roberts, Chicago District Manager of the Bureau of Foreign and Domestic Commerce, writes MANUFACTURERS NEWS as follows:

"We are in receipt of a letter from Vilasuso & Ots, P. O. Box 2445, in which they state they are desirous of making connections with manufacturers and export houses dealing in produce, provisions, dry goods and general merchandise.

"According to their letter, they have been selling in the Cuban market for ten years and can offer good references. It must be understood, however, that we will acknowledge no responsibility whatever in connection with any business which may be negotiated with them."

Raw Silk on Hand

Raw silk on hand in the United States on Feb. 1, 1924, as reported by the Silk Association of America, was as follows:

On hand, Jan. 1, 40,959 bales; imports in January, 36,364 bales; deliveries to mills, 32,925 bales; stocks on hand, Feb. 1, 44,398 bales.

In 1922 there was a total of 350,202 bales imported, an average of 29,184 per month.

Implement Exports Increase

An increase of 95 per cent in the export of agricultural implements in 1923 over those for 1922 is reported by the Agricultural Implements Division of the Department of Commerce. The total value of implements exported during the twelve months of 1923 was $50,308,809, almost double the total of $25,763,882 reached in 1922, and $5,000,000 in excess of 1921 exports.

SALES MANAGEMENT

"Deadly Plateau of Ease" Worst Enemy Confronting Executive* and Worker—Inspire Men for Real Results

By **DR. ARTHUR HOLMES**
Professor of Psychology,
University of Pennsylvania

ABOUT 1776, when Adam Smith wrote his "Wealth of the Nations," our modern industrial system began. From 1775—to something like 1790—was a period of a tremendous amount of inventions, the fundamental one being the steam engine, and others to which it was applied as a result. In consequence of the book written by Adam Smith, the whole industrial system of that day was revolutionized and ours was begun.

That one book did more in human affairs than any one volume ever written, except the Bible. A tremendous power! A directive power of the new forces that had sprung up in invention, with the result that the old guild system passed away, where every man worked for himself or used a few apprentices; where every man endeavored not to produce the most of a standardized product, but to produce a certain product stamped with a certain quality and a certain individuality.

Now, that was all gone. These people were getting into the great factories where the machinery hummed. The steam engine was hitched to the machinery and for the first time men began to think of efficiency in production—how to produce the greatest results of a standardized quality with the least expenditure of energy.

Along with the study of efficiency, machine efficiency, men began to run across the "personal element," the "human factor." Now the slogan changed from efficiency" of the old era to "psychology" in the new era, and everything was centered around and focused upon the "human element." In this development the problem became how to make this man efficient. A number of devices sprang up, fundamentally piece work—to get more work out of the man. Then came the bonus system and profit-sharing, and, in addition to that, various departments of education connected with the different factories.

Along with those came an enormous amount of other welfare work. The thought was to make the factory light, clean and warm; to provide rest rooms, elevators and lunch counters. In other words, "psychology" became the great slogan.

In working up this problem of efficiency with the men themselves, and guided and influenced and driven on by the motives of business and of this industrial system, men like you made a perfectly marvelous discovery. Some men haven't found it yet. They found that you can't *hire men!* The old method was—hiring a man. You hired him, you paid him so much wages, and then you expected so much from him. It was an appeal to his greed, and today there are still many doing that.

A friend of mine, a sales manager, told me this only the other day: "We can pay our men a $50 bonus if they do up to $10,000 worth of sales. In a month, lo and behold! a lot of men get up to the $10,000 mark and stop. If we raise that bonus to $75 and set the sales up to $12,000 or $15,000, a lot of them can get right up there. Then they stop, and we put the bonus at $100. They climb again to $20,000 and there they stop."

Any of you men who are sales managers or executives, if you are alive, wide-awake, are trying to interest your men in their work and keep them developing, will find that "deadly plateau of ease" is the worst thing that confronts you at the present moment. The men who have climbed clear to the top—and some of them do—are the men who never strike a "plateau of ease."

What men have found out is that you can't hire men to do that sort of thing. You can hire men to give a certain amount, a section—and the smallest portion—of their energy to produce a material product. That can be measured and brought up to a certain standard in quantity or quality. You can get that for wages, but you can't hire a man. You can't do it to save your soul!

The old idea was, "Fire him if he doesn't come up to the standard of quantity and quality." Appeal to his greed and then appeal to his fear—two of the lowest motives in life.

What is happening? We are entering into another era, the dawn is just coming. The rays of it have struck some men, and they will agree with me that there is only one thing you can do, and that is, INSPIRE MEN. When I say "inspire" I think the best figure I can use to put that thing squarely before you is the Creation of Man.

"But Jehovah breathed into him the breath of life and he became a living soul."

"Inspire" literally means to "breathe into." Breathe into executive, straw boss, foreman, superintendent, sales manager, any man that he has under him or with him! Men, you have got to breathe into them the breath of life.

What do I mean by breathing into a man the breath of life? Psychology. How are you going to get a man interested in his work? That is the problem I am driving at. Read G. Stanley Hall's "Adolescence." Our ideas and ideals are formed during the adolescent period, say from 12 and 13 up to about 20. You young men shall see visions, and you old men dream dreams.

Men are built on two planes. Down below is the animal plane, and in that plane the instincts rule and reign. Men likewise can live on another plane, an intellectual plane, where ideas or ideals dominate their lives, where reason takes charge and chooses a means to an end and then goes toward that end.

What is the objective of life? Making money? Any man who has made money will tell me, "No." That is an insignificant and trifling means to an end.

But money conceived as a means to an end has an entirely different significance in a man's life. There is that other end that counts, the objective before him.

Happiness consists in putting out a vision of some kind and then moving toward it. You have to choose it deliberately with that power that makes a man a man. It has to be spiritual, or he will not be a man. It must be an idea, an ideal, a vision.

---

*Abstract of address delivered before the Chicago Executives' Club on "Hiring, Firing, Inspiring."

New Cunarder, "Ascania," Is Launched at Newcastle

Cunard Line officials have been advised that the new steamship "Ascania," of 13,000 gross tons, has been successfully launched at the Newcastle-on-Tyne yards of W. G. Armstrong & Whitman. This vessel is one of five of the same class as the "Antonia," "Andania," "Ausonia" and "Albania," the latter vessel, however, being cabin only, the others designed to carry 1,700 cabin and third class each.

This new Cunarder, like her four predecessors, is an oil burner with a single funnel, thus providing greatly increased space for passenger accommodations above that usually afforded on a ship of her tonnage. Her machinery is of the Parson type of double reduction geared turbines which will attain for her a speed of fifteen knots.

When completed the new ship will probably be placed in the Canadian ports service.

Nearly 1,000,000 Motor Cars Licensed and $10,000,000 in Fees Collected in State of Illinois in 1923

NEARLY 1,000,000 automobiles were licensed in Illinois during 1923, and nearly $10,000,000 in automobile fees were collected for use in road construction, according to the report of Secretary of State Louis L. Emmerson. These figures represent a very considerable increase over the preceding twelve months, the number of cars licensed in 1922 being 786,190 and the fees collected amounting to $7,861,211.

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can — that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

All Size Trucks for Rent

Dump Trucks

By the Hour, Day, Week or Contract

We handle anything, anywhere

MONROE 5100

MOTOR TRANSPORTATION CO.
The World's Pioneer Motor Truck Operators
1201 WEST LAKE STREET - CHICAGO

The automobile licenses issued during 1923 and the fees collected are divided as follows:

	Licenses.	Amount.
Cars licensed	846,949	$7,132,216.16
Trucks	122,326	1,280,255.98
Dealers	4,516	86,940.00
Total licenses	973,791	
Chauffeurs	92,871	$ 349,092.00
Duplicate plates	......	65,318.35
Transfers	......	125,612.34
Motorcycles	7,611	26,605.09
Tractors	195	4,192.80
Miscellaneous	......	42,301.62
Total fees, automobile department		$9,652,594.34

The growth in number of automobiles and the amount of money collected in fees for use in road building is illustrated by the following table, which shows the number of automobile licenses and the amount of fees collected every year since 1911, the first year under the state automobile law:

	Fees.	Autos.
1911	$ 105,344.00	38,269
1912	375,716.22	68,012
1913	507,134.77	94,646
1914	703,403.70	131,150
1915	924,905.74	180,832
1916	1,236,566.35	248,429
1917	1,588,834.69	340,292
1918	2,764,330.28	389,761
1919	3,262,176.57	478,438
1920	5,886,771.82	568,739
1921	6,336,188.26	623,916
1922	7,861,211.21	786,190
1923	9,652,594.34	973,791

The total collections of the office of Secretary of State were $14,362,776 in 1923, and in 1922 totaled $11,943,376.

Cadillac War "Vets" Overhauled

Memories of the late World War were vividly brought to mind upon the recent return to the factory of the Cadillac Motor Car Company in Detroit of seven Type 57 Cadillacs which had seen much service at the battle front. These cars were among the many hundreds of Cadillacs which stood the test as the official seven passenger cars of the United States Army, both on this side and across the seas.

The bodies of the cars were battle-scarred, some having been riddled by bullets. The speedometers were in good condition and offered proof that each of the cars had traveled 70,000 miles or more. Considering the usage given them, their mechanical condition was exceptionally good.

These veterans of the World War were recently shipped by Government officials to the factory to be thoroughly overhauled and repainted. When this work is completed they will be sent to Washington, D. C., where they will again enter the service of the Government.

Elect Lincoln Highway Officers

The Lincoln Highway Association, organized and launched by Carl G. Fisher of Indianapolis and Miami, Fla., in 1913, recently held its tenth annual meeting in Detroit. J. Newton Gunn was elected President for the fourth consecutive time. In addition to Mr. Gunn, other officers elected were:

Vice-Presidents—F. A. Seiberling, Henry B. Joy, Carl G. Fisher, Roy D. Chapin.

Vice-President and Secretary—A. F. Bement.

Field Secretary—G. S. Hoag.

Treasurer—Emory W. Clark.

The Executive Committee is composed of the following:

F. A. Seiberling, Roy. D. Chapin, Sidney D. Waldon, Alvan Macauley and Henry B. Joy. The following were elected directors:

J. Newton Gunn, Roy D. Chapin, Henry B. Joy, F. A. Seiberling, Alvan Macauley, W. O. Rutherford, Carl G. Fisher, Edsel B. Ford, G. M. Stadelman, John N. Willys, W. C. Durant, C. S. Mott, A. Y. Gowen, Emory W. Clark and A. F. Bement.

Long Trip by Auto Men

One of the longest trips made by executives of any company was recently completed by three members of the United Motors Service, Ralph S. Lane, President, F. A. Oberheu, Sales Manager, and D. M. Sweeney, Supervisior of Distributors. This trip started Sept. 4, 1923, covering the principal cities from coast to coast and from Canada to the Mexican border. It was completed Jan. 22, 1924. Thirty-three cities were visited and 105 distributors called on. The total mileage was 43,425, a distance equal to nearly twice around the world.

United Motors Service is the authorized factory service organization for Delco, Klaxon and Remy electrical equipment, Hyatt and New Departure bearings, Harrison radiators, Jaxon rims and AC speedometers.

Garford Head Resigns

E. A. Williams, Jr., has tendered his resignation as President of the Garford Motor Truck Company of Lima, O., to take effect immediately.

tal Debt of All Civil Divisions in U. S., $32,786,715,000—Per Capita, $301

-IE Department of Commerce makes he following announcement of the total of the National Government of the y-eight states and the District of Colum- and of all cities, towns, villages, school ricts, townships, drainage districts, park ricts, and all other civil divisions hav- the power to incur debt. For the Na- al Government the fiscal year ended e 30, 1923, and for the states and other il divisions the year ended in the calen- year 1922. This preliminary summary part of the decennial census on wealth, ot, and taxation, and is comparable with imilar report for the year which ended ween July 1,1912, and June 30, 1913.

The total gross debt of the National Gov- ment and of the states, counties, cities, d all other civil divisions amounted to $6,814,955,000 in 1912 and $32,786,715,000 in 1922, an increase of 381 per cent. The per capita gross debt was $70.20 in 1912 and $301.56 in 1922. For the state governments the debt increased from $422,796,000 to $1,162,648,000 an increase of 175 per cent; for the counties, from $371,528,000 to $1,366,636,000 an increase of 268 per cent; and for all other civil divisions from $3,104,426,000 to $7,731,658,000, an increase of 149 per cent.

The gross debt of the National Government increased from $2,916,205,000 in 1913 to $22,525,773,000 in 1923, or 672 per cent. The indebtedness of other countries to the United States Nov. 15, 1923, was $11,800,010,245; and of this total $4,600,000,000 represents the debt against Great Britain.

	Total debt, 1922 (Totals expressed in thousands.)					
	Total	Funded or fixed (debt)	Special assessment bonds	All other debt	1912	Per cent of increase, 1912 to 1922
te governments...........	$ 1,162,648	$ 1,064,008	$.......	$ 98,640	$ 422,796	175
inties	1,366,636	1,165,228	98,347	103,061	371,528	268
ies and all other civil divi- ions	7,731,658	6,491,905	656,485	583,268	3,104,426	149
Total	10,260,942	8,721,141	754,832	784,969	3,898,750	163
tional Government	22,525,773	16,536,134	....	5,989,639	2,916,205	672
Grand total	32,786,715	25,257,275	754,832	6,774,608	6,814,955	381

As an offset to the above gross debt of $32,736,715,000, there are sinking funds and other assets held for the retirement of such debt in 1922 of $1,934,899,000, or a net debt of $30,851,816,000, or $283.76 per capita.

The gross debt reported above represents all of the public indebtedness, including funded or fixed debt (long term and serial bonds), special assessment bonds, temporary loans, outstanding warrants, and other debts of every character. Of the total public debt of 1922 the National Government represented 68.7 per cent, the state governments 3.5 per cent, the counties 4.2 per cent, and all other civil divisions 23.6 per cent; in 1912 the National Government represented 42.8 per cent of the total public debt, the state governments 6.2 per cent, the counties 5.5 per cent, and all other civil divisions 45.6 per cent.

The annual interest on the gross debt outstanding, $32,786,715,000, computed at the rate of 4 per cent, would amount to $1,311,468,600, or $12.06 per capita. At 4½ per cent and 1 per cent sinking fund the total charges would be $1,803,269,325, or $16.59 per capita. The actual amount lies somewhere between these figures.

Royalties to Indians

Royalties amounting to $36,659,810 were paid to Indians during the last year from oil and gas leases on their lands in Oklahoma, Montana and the Shoshone reservation in Wyoming, the Department of the Interior announces.

BUSINESS AND FINANCE

American Bankers Withdrawing from Foreign Financial Field; Branches for National Banks Held Illegal

AMERICAN bankers are gradually withdrawing from foreign trade banking, according to the New York *Journal of Commerce*, which bases its conclusions on the retirement of the Asia Banking Corporation and its absorption by the International Banking Corporation, which is now left practically alone in that field. This decision on the part of bankers in this country, according to this publication, has been "unfavorably received abroad, as it greatly curtails access to our markets on the part of foreigners who want to use American capital in developing business or increasing investments abroad."

Continuing, *The Journal of Commerce* says:

> "While it is easy enough to understand and sympathize with the policy of those bankers who find it necessary to cut their losses and reduce their overhead, and to see no reason why they should continue in a field which for the most part holds out risk and does not furnish corresponding promise of advantage, the general situation is none the less regrettable. We are evidently 'scrapping' an important equipment of trade machinery which is certain to be wanted at some time in the future, even if not very active to-day. When the time comes that we do feel the need of it, we shall, as before, find ourselves without the necessary resources. The opportunity provided by recent legislation will still, no doubt, be available, but we shall have to make an entirely new beginning in acquainting ourselves with its proper uses."

Savings Gain in Illinois

According to the Feb. 1 issue of the monthly report of business conditions in the Federal Reserve District of Chicago, the crediting of semi-annual interest was largely responsible for the aggregate gain of 1.8 per cent in savings deposits in the Federal Reserve District of Chicago, as reported on Jan. 1 by banks representing approximately 40 per cent of the savings deposits in the district. The report says:

> "The largest increase was in Illinois, where a gain of 3.5 per cent was reported, while in Michigan, which was the only State in the District to show a downward trend, the decrease was 0.7 per cent. Among the reasons given for the shrinkage in Michigan deposits after the steady gain since February, 1922, were the withdrawals of funds by 1923 Christmas Savings Club members and the payment of Winter taxes. Aggregate deposits for the District, compared with a year ago, increased 9.4 per cent, with Michigan showing the greatest gain.
>
> "The increase of 1.2 per cent in the average savings account in the District between Dec. 1, 1923, and Jan. 1, 1924, was due chiefly to the gains in Illinois and Wisconsin of 2.6 per cent and 2.2 per cent, respectively. Michigan's average account decreased 0.7 per cent, while Indiana and Iowa showed gains of 0.8 per cent and 0.[illegible] per cent respectively. Compared with a year ago, the average account for the entire district increased 0.9 per cent."

Earnings of Gas Company

The Peoples Gas Light & Coke Company, Chicago, broke all records in 1923 for gas sales, according to the annual report to stockholders by President Samuel Insull. The result was that revenue of the Company earned $10.90 a share on its capital stock.

Sales in 1923 totaled 29,791,110,822 feet compared with 27,602,698,062 feet in 1922. The increase was largely in the use of industrial gas, though there was a substantial increase in sales for domestic purposes also, President Insull stated.

Last year the Company's operating revenue was $30,615,187, compared with $29,645,777 in 1922. Net income after all deductions was equal to $4,198,513, against $3,261,996 the previous year. This was equal to $10.90 a share on the capital stock in 1923 and $8.47 in 1922. After deducting $2,983,750 for dividends paid in 1923 and $1,924,890 in 1922, there was a surplus for the years of $1,214,763 and $1,337,006 respectively.

Good Year for Deere & Co.

Deere & Company, Moline, Ill., manufacturers of agricultural implements, report net income for the year ended Oct. 31, 1923, of $1,789,209. This compares with an operating loss of $2,520,779 in 1922. Sales for the fiscal year 1923, according to William Butterworth, President, were 40 per cent greater than during the preceding year, but were only about 60 per cent of a normal volume.

American Steel Foundries' Earnings

The American Steel Foundries for the year ended Dec. 31, 1923, reports net profits were $7,595,944 after depreciation, as compared with $3,709,866 in 1922. Net profits for 1923 are equal to $9.70 a share on the common stock after depreciation and Federal taxes and allowance for preferred dividends, as compared with $4.32 a share earned in 1922.

rious Facts on Foreign rade; Yes, We Eat Bananas

Ve imported 45,093,892 bunches of ban- s in 1922, valued at $19,145,911. Re- ed to a per capita basis these figures cate that every mother's son of us sumed two-fifths of a bunch of this ectable tropical fruit. In addition to bananas, which far outstripped all er fruit importations, we bought 111,- ,000 pounds of lemons, 34,712,185 inds of figs, 53,600,000 pounds of dates, l 21,437,820 pounds of currants. Nut oorts for the year were valued at $28,-),540.

The per capita value of all imports in 22 was $27.71, according to statistics ntained in "Foreign Commerce and Navi- tion of the United States," issued by the S. Department of Commerce. This mpares with per capita imports of $23.33 1921; $47.22 in 1922; $18.04 in 1913; d $4.40 for 1821, the first year for which gures were tabulated.

A strong revival characterized American nports of cheese in 1922. According to the gures our foreign purchases of cheese and ibstitutes totaled 46,573,099 pounds. This presents a threefold increase over our 920 imports and exceeded the 1921 figures y about 20,000,000 pounds. Exports were ightly over 5,000,000 pounds and rep- esented a falling off of more than 50 per ent from 1921 shipments.

We spent the tidy sum of $51,555,739 or imported diamonds in the rough and ncut state, during 1922. This sum rep- esents an increase of 82 per cent over ur imports for the preceding year, and alls only about $5,000,000 below our 1920 mports. Imports of unstrung pearls for he year were valued at $8,580,520.

We also took 1,891,771 foreign made vatches and watch movements valued at 7,122,783, representing a slight decrease n number, but an increase in value over 1921.

Art works valued at $26,989,083 were imported into this country during 1922. Of this amount, admitted free of duty, the roductions of American artists were valued at $246,095; original paintings, statuary, etc., $5,959,765 and works of art 100 years old or over, $19,438,437.

Cement Industry in 1923

Preliminary report on the cement industry for 1923 by the United States Geological Survey, indicates remarkable development in the manufacture and distribution of Portland cement during the past year. Prior to last year, 1922 was the banner year in the industry and the following figures show the substantial progress made during the past year:

	1922	1923
Production (in bbls.)	114,789,000	137,377,000
Shipments (in bbls.)	117,701,000	135,887,000
Stocks on hand, Dec. 31	9,134,000	10,581,000

The remarkable record made by the industry during 1923 in taking care of a demand which has increased over 40 per cent in two years could scarcely have been achieved under less favorable conditions. The cement industry is particularly sensitive to transportation and fuel situations and the absence of shortage of both these essentials during 1923 was most helpful.

Real Estate Value Survey of Fifteen Illinois Cities

The Tax Commission of the Chicago & Northwestern Railroad has recently completed a survey of the real estate values of the larger cities of Illinois touched by that line. The figures are based on the total number of real estate transactions between 1915 and 1923. The following table shows the real estate wealth of the larger cities, with the per capita wealth:

	Total	Per Capita
Chicago	$5,001,615,000	$1,751
Rockford	117,510,000	1,638
Peoria	126.774,000	1,607
Evanston	105,900,000	2,589
Oak Park	93,823,000	2,041
Springfield	90,860,000	1,479
Aurora	62,125,000	1,619
Elgin	41,765,000	1,497
Waukegan	30,709,000	1,523
Freeport	28,685,000	1,413
Maywood	17,947,000	1,351
Streator	17,442,000	1,164
Ottawa	17,594,000	1,570
Pekin	16,693,000	1,310
LaSalle	14,219,000	1,053

Joliet and East St. Louis are not listed as the Northwestern does not touch those cities.

Every Audit Should Be

A Detailed Audit

The leaders in practically every field of business now regard the *Detailed Audit* as an absolute necessity. The Reserve Cities Bankers Association, and most of the Credit Associations throughout the country, stand on record as preferring it to the Balance Sheet Audit.

Offering an expert and independent study in *detail* of the items represented *in mass* by balance-sheet figures, the *Detailed Audit* not only verifies, but clarifies. *It digs beneath the figures and reveals the buried facts.*

Every audit should be a *Detailed Audit*. It brings to light avoidable leaks and wastes. It finds the flaws in accounting, in credit and collection methods. It presents the cause, and the effect, of financial policies. It points to possibilities for greater profits.

Free from the qualified statements of the Balance Sheet Audit, the Detailed Audit is the ideal basis for credit. Complete in its presentation of the *facts* behind the figures, it is the only basis for executive plans and action which lead to progress and success.

Austin J. Doyle, Ex-Police Head of Chicago, Is Dead

Austin J. Doyle, Superintendent of Chicago's Police under the elder Mayor Carter H. Harrison, died recently at New Orleans. Mr. Doyle was born in Chicago, Sept. 18, 1849 and lived his entire life in that city. He was the originator of the patrol box system, which has been adopted by nearly every city in the United States. On resigning from the police department in 1885 he became Superintendent of the Chicago Passenger Railway and was President of that company when it was purchased by the Yerkes interests. After that he became identified with the brewery interests, and for twenty years was Manager of the Illinois State Brewers' Association and the Chicago and Milwaukee Brewers' Association. Mr. Doyle retired from active business a short time before he went South for his health. He is survived by his widow, Pauline A. Doyle, and the following children: Agnes E., Francis A., Robert E., Paul A., Miriam A., and F. Winston Doyle.

Farm Census in 1925

Greater accuracy in crop and livestock estimates will be made possible by taking an agricultural census every five years, says the United States Department of Agriculture. Congress has already passed the basic law for taking such a census in 1925. The proposed census will be of particular value as showing the agricultural readjustments in the post-war period.

Wages, Salary, Form Chief Part of Taxable Earnings

In an analysis of the income of different classes of citizens, prepared by William H. Barr, President of the National Founders' Association, the greater part of the nation's taxable earnings are said to accrue from wages and salaries.

Analyzing the national income, Mr. Barr says:

"There are only 7,000,000 income tax payers in the United States who had a total income in 1921 of $23,328,721,932. That is more money than the Government borrowed in the war bond issues. Three-fifths, or nearly $14,000,000,000 of the $23,000,000,000 is derived from wages and salaries. The following figures of the Internal Revenue Bureau on the derivation of taxable American incomes should be studied not only by the average man, but by that peculiar breed of politician who regards all income of a taxable character as being the possession of capitalists and business men:

Wages and salaries	$13,813,169,165
Business	2,366,318,610
Partnerships, fiduciaries, etc	1,341,186,308
Profits from sales of real estate, stocks and bonds	462,858,673
Rents and royalties	1,177,957,882
Dividends	2,476,952,399
Interest and investment income	1,690,338,895
Total income	$23,328,781,932

"If this information can be forced into politicians' heads, perhaps we shall have more patriotic consideration of the Mellon Tax Plan."

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

HAT approximately 60,000,000 people in the United States are now living in ctrified homes, working on electrified ms and in electrified factories, stores d offices, is shown by recent figures made blic by the National Electric Light As- iation, stating that more than 1,150,000 w customers have been added to the ctric light and power companies' lists 1923, bringing the total up to 13,356,- 0.

Nearly 10,000,000 more kilowatt hours re consumed during the past year than 1922, the total amount consumed in '23 being 57,000,000,000 kilowatt hours.

The electric light and power industry st year, according to the report, expended '02,143,000 on progressive building ograms, the total investment in the in- ıstry now reaching $5,800,000,000. Its oss income for the year is estimated at l,300,000,000 out of which all costs of eration and maintenance and taxes have en paid. It was estimated that the electric ght and power utilities of the country aid to Federal, state and municipal treas- ries in the neighborhood of $130,000,000, r 10 per cent of their gross for the year 923.

Of the $800,000,000 raised last year it estimated that $250,000,000 was ob- ined through customer ownership, that , through the sale of securities to ap- roximately 300,000 customers and em- loyes of the companies.

About 35 per cent of the electrical energy eveloped in this coutnry is manufactured y water power, the remaining 65 per cent eing developed by central steam stations. Vhereas, a few years ago, it took from ight to ten pounds of coal to generate one ilowatt hour of electricity, the mod- rn, efficient electric light and power plants ow use only two pounds and many up-to- ate steam power plants are using one and ne-half pounds, or even less, per kilowatt our.

It is estimated that there are today more han 1,700,000 resident electric customers nd 2,205,500 commercial customers.

Leads In Farm Telephones

There are about 2,700,000 telephones in he United States in farm dwellings, or early one telephone to every two rural omes. No other country has anything pproaching this farm telephone develop- nent. There are 27,000 rural lines and sys- ems connected with the Bell System.

Spain to Hold Electric Show

Inauguration of the Barcelona General and Electrical Exposition (Exposicion In- ternacional de Industries Electricas y Gen- Espanola) has been fixed by a royal decree for Oct. 12, 1926. The exposition will close on July 1, 1927.

Surface Lines' Promotions

Several changes in the personnel of the management of the Chicago Surface Lines have recently been announced. Guy A. Richardson has been elected Vice-President and General Manager; Frank L. Hupp has been appointed Assistant to the President as well as Secretary of the Company, and Joseph V. Sullivan, who has been Assistant to the President, has been appointed Assistant to the Vice-President and General Manager. John E. Wilkie has been given the same title. Both will assist Mr. Richardson, with specially assigned duties.

Edison Budget, $29,250,000

Expenditures of approximately $29,-250,000 are provided for in the 1924 investment budget of the Commonwealth Edison Company. This represents an increase of nearly $10,000,000 over the budget estimate made early in 1923, which was exceeded, however, by nearly $4,000,000 because of the carrying out of a more extensive program than had been planned.

The 1924 budget of operating expenses totals $41,000,000, including municipal compensation, taxes and retirement service.

Sixteen million dollars will be spent this year in providing additional generating capacity.

Employes to Buy Bonds

A new opportunity to subscribe to the 8 per cent bonds of the Employes Securities Corporation will be offered General Electric employes, according to a recent announcement by President Gerard Swope. The bonds will be offered March 1, to employes who have had six months' service or over. At the present time over 25,000 employes of the General Electric Company hold such bonds or are making payments on them. Two previous offerings of the bonds were made, one in February and the other in August of 1923.

$130,000,000 In Taxes

Almost $130,000,000 was paid in Federal, state and municipal taxes by the electric light and power utilities of the country in 1923. M. H. Aylesworth, Managing Director of the National Electric Light Association, states that 1,150,000 additional customers were added in 1923, bringing the total to 13,356,000; that 2,890,400 kilowatts were added to the generating capacity and that the output was increased by more than 57,000,000,000 kilowatt hours.

A total of $702,143,000 was spent last year for additions to light and power systems. The total investment of the industry now reaches the stupendous figure of $5,-800,000,000. Last year 300,000 customers and employes bought stock, totaling $250,-000,000.

"STATION TO STATION"
Service Is Quickest

THOUSANDS of long distance telephone calls are made on the "station-to-station" basis, that is, the calling party asks only for the number of the called telephone or gives the name and address of the called subscriber without designating a particular person.

This service is the quickest and it saves you about 20 per cent.

In many cases the person you want will answer or is immediately available; if not, you can often deal satisfactorily with the one who answers.

"Long Distance" will be glad to tell you more about this time and money saving service.

"Station-to-station" long distance calls meet almost every requirement and the day rates are about 20% lower than for "person-to-person calls. Evening rates are about 50% and night rates 75% lower than day rates for "station-to-station" calls, but no rate is reduced below 25 cents. Consult the telephone directory for further details or call "Long Distance."

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

The Electric Winch is
one way to save

The Electric Winch is at your service—a hardy, compact, dollar-earning and dollar-saving outfit. The above view is of a portable electric dock winch driven by a G-E alternating current motor. Current is supplied through a flexible cable attached to a plug outlet.

A portable master controller gives the operator a range of 100 feet radius and he secures perfect control of the drums. He also has the advantage of being able to see the load hoisted or lowered.

Greater ease and convenience of operation, greater certainty and dispatch in handling, and operation in all kinds of weather are among the advantages of the electric winch.

Many leading manufacturers of electric winches use General Electric equipment on their products. These manufacturers have the co-operation of G-E engineers in making the proper application of electric equipment to the winches you purchase from them.

Congress Hospitality

THE Congress is ideally located, near the center of Chicago's activity, yet away from the noise and dirt of the Loop. It has accommodations and appointments as fine as the most particular can desire. But the most important factor in the upbuilding of its enviable reputation has been its warm, unfailing hospitality. The fame of Congress welcomes and attentiveness has spread afar.

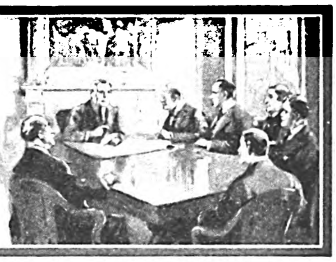
JAMES C. GILRUTH, *Associate Editor*
NORMAN M. FRENCH, *Sales Manager*



Why Coal Miners Win

THERE will be no coal strike. Soft coal operators have agreed to a three-year extension of the present contract with miners. This provides for a basic rate of $7.50 a day with corresponding rates for tonnage men. The miners have won again. The operators and the public have lost. They will always lose so long as public sentiment will stand for the exactions of a preferred class of labor. The price of coal is fixed by public *laissez faire.*

Making a Beverage Popular

SIR CHARLES HIGHAM, British advertising man, is in the United States with a quarter of a million dollars from the India Tea Growers' Association to persuade Americans to drink more tea. Why not pass an act forbidding the drinking of tea?

A Fearless Official

THE Chicago Federation of Labor has attacked State's Attorney Robert E. Crowe as "unfair." He is a candidate for re-election in Cook County, Ill. Some of the officers of the trade unionists are against Mr. Crowe because he has enforced the law by prosecuting labor union murderers, gunmen, bombers, sluggers, jury bribers, perjurers, extortioners, and plain grafters.

Mr. Crowe found a reign of terror existing when he became State's Attorney of Cook County. He complied with his oath of office in stamping out crime as he found it, without fear or favor.

State's Attorney Crowe is deserving of the support of all good citizens, including trade unionists who do not believe in murder, violence or grafting. Every employer should help him to re-election. Every employe, who wants to be protected against hired assassins and sluggers, should get out and work for him.

When we have in office a man with nerve and integrity, let us keep him there.

Steel Business Good

WITH the steel industry showing a remarkable renewal of activity in January, prospects that 1924 will be a year of profitable industrial activity are exceedingly good. Building permits throughout the country were also high for January, and these were in large measure responsible for stimulating reports from the steel mills. Pig iron production for January showed an increase for the first time in seven months. The only cloud on the horizon is the disposition of some of the building trades to scrap the building boom by asking too high wages. Capital already is fighting shy of excessive building costs.

Eight-Hour Day Economic Failure

THE eight-hour day has been practically abolished in Germany as too much of a luxury for a nation struggling to get out of debt and keep from starving. It is the last Socialistic experiment in that land to be given up. Sufficient production could not be maintained on an eight-hour basis. So many exceptions to the eight-hour day were made by the Government that it is now the exception rather than the rule. Hard work will put Germany back on her pre-war financial footing.

Make Economy Fashionable

RAISING the standard of living is a desirable thing, but there comes a point in the life of individuals and nations when it is extravagance. This point apparently has been reached.

The United States Bureau of the Census reports that taxes collected in the United States during 1922 amounted to $68.37 for every man, woman and child in the land. Federal taxes were five times those of 1912; the increase in state collections was 181 per cent, while counties levied taxes of 141 per cent and cities and other incorporated places 80 per cent in excess of those of 1912.

It is true that a large part of the increase in the case of the Federal Government was the inevitable outgrowth of the war. A large part of the increased taxation, however, especially by the state and local governments, has been due to extravagance.

What we need in this country is to make economy fashionable. There should be some thought for the future. We can get along without some of the luxuries of government; confining ourselves to necessities will reduce tax burdens. There is no excuse for spending our money as fast as we make it. That seems to be the disposition of the United States.

anufacturers News; an Appreciation

Vigorous Policy and Benefit to Industry Related; First Issue Was Published 12 Years Ago, Feb. 29, 1912

By **CHARLES PIEZ**
President, Link-Belt Company,
and
Former President, Illinois
Manufacturers' Association

SOME enthusiastic friend secured my nomination as a candidate for member of the Board of Directors of the Illinois Manufacturers' Association about sixteen years ago, and as I s a newcomer in the community, and any too well known, I was elected with- seeming difficulty.

I had been in charge of Link-Belt affairs the East, with headquarters in Philalphia, where the pace is neither as swift r the methods as aggressive as they are Chicago.

Up to 1906, the time of my transfer, the oblems that occupied my time had been erely those internal ones which occupy l manufacturers.

Pennsylvania was a conservative state, iladelphia a contented community. Bend a few brief, though sharp tilts with tside unions on erection work, I had had labor trouble. The demand for social d labor legislation hadn't yet appeared, id the conviction that prosperity could be cured by legislating against one group interests for the benefit of another had t gained many adherents in either state national legislatures.

It was peculiarly a condition under hich the manufacturer could afford to ind his own business, and that was what ıbstantially all manufacturers in Pennlvania, at that particular time, did.

There was no vestige of co-operation, cause there was no apparent need.

What a change the transfer to Chicago in 06 brought! I landed in the very midst a foundry strike, and looked back with nging to the ease and contentment that tended the conduct of business in the ity of Brotherly Love."

Everywhere there seemed to be a determined effort on the part of organized labor odies to wrest control of business from e hands of its owners. That is where I woke to the fact that life in Chicago reuired organized defense.

It was at about that time I was elected the Board of the Illinois Manufacturers' ssociation, and my impression after a few onths of service, was that the organizaon was not at all defensive but was, in ct, militantly aggressive in the manufacrers' interest.

The attitude of the able Secretary of the ssociation was best indicated by parahrasing the famous toast of Stephen Deatur—"The Illinois Manufacturer; in his truggles with other interests may he alays be in the right; but the Illinois Manfacturer, right or wrong."

Believed In Own Principles

"Rank partisanship" the judiciallyninded outsider called it, forgetting that an organization matched against the conditions that then obtained could succeed only by believing in the soundness of its own principles, by insisting uncompromisingly on the fairness of its own position.

Charles Piez

Sound partisanship, like sound nationalism, is a big asset in a fight, and John M. Glenn has an abundance of both of these virtues.

When organized labor developed the mania of reaching the industrial millennium through class legislation, Mr. Glenn felt that something had to be done to show the manufacturer where his interests lay, some step had to be taken to arouse him to the necessity of united action.

The daily press could not be depended on to present the conditions bearing on industry, and no other medium that devoted itself exclusively to the interests of the manufacturers of the state existed. John Glenn was conscious of this need for several years, but felt that the publication of such a medium hardly lay within the province of his Association. So he took upon himself the financial and physical burden involved in such an enterprise and began MANUFACTURERS NEWS, the first issue of which was published on Feb. 29, 1912.

I have watched it for twelve years, I have seen it grow in circulation, in influence. It has fought through all these years, valiantly on the side of the manufacturer and his interests. It has expressed itself vigorously and fearlessly whenever the manufacturers' rights were invaded, whenever legislation departed from sound economic principles and listened to the counsel of theorist or propagandist.

A Vigorous Champion

But MANUFACTURERS NEWS has been more than a vigorous champion of the manufacturer, it has been a very satisfying source of the kind of information which the manufacturer needs.

Not a single subject, from raw materials to finished product, from problems of administration to those of Federal taxes, has been omitted from its pages. Its articles are always timely, their presentation interesting and informative, and the editorials in Mr. Glenn's most vigorous style, leave no question as to where the Editor stands on the problems of the day.

MANUFACTURERS NEWS has been of great aid in maintaining proper manufacturing conditions in the state, and in securing wholehearted co-operation of the manufacturers of the state in all matter of common interest.

It has helped to keep the Illinois Manufacturers' Association a fighting organization, and, with the exception of John Glenn himself, MANUFACTURERS NEWS is the best influence for the general good which the manufacturers of the state have.

Seasonal Employment Drop, U. S. Labor Survey Shows

A general decrease of 9 per cent in employment during January was accompanied by a 4.9 per cent decline in pay-roll totals and a reduction in per capita earnings of 4.1 per cent, according to reports from 7,849 establishments in fifty-two manufacturing industries compiled by the Bureau of Labor Statistics of the Department of Labor, of the Federal Government.

Compared with January, 1922, however, 4,121 establishments in forty-three industries showed increases of 1.3 per cent in employment, 6.8 per cent in total wages and 5.5 per cent in per capita earnings.

Despite the seasonal lessening of production for inventory and other purposes, the rate of decrease in employment was not as great in January as in December, when it was 1.5 per cent. The decline in production, however, was reflected in pay-roll totals, which showed a drop of 1.7 per cent in December.

In one week of December the 7,849 establishments reported 2,575,172 employes who received a total compensation of $68,850,028, as compared with 2,552,742 employes in January, with total wages of $65,481,467.

U. S. Steel and Carnegie Pension Report for 1923

The thirteenth annual report of the United States Steel and Carnegie Pension Fund, established Jan. 1, 1911, and applicable to the employes of the United States Steel Corporation and its subsidiaries, shows that in 1923 a total of $1,448,112.84 was paid out in benefits. There were on Dec. 31, 1923, a total of 4,054 active beneficiaries on the rolls.

Since the establishment of this fund a total of $9,543,235.33 has been paid out, as follows:

Total for 1923	$1,448,112.84
Total for 1922	1,266,661.74
Total for 1921	947,879.15
Total for 1920	779,766.60
Total for 1919	733,707.45
Total for 1918	709,059.82
Total for 1917	712,506.65
Total for 1916	711,130.33
Total, 1911 to 1915, inclusive	2,234,410.75

Following are the companies whose employes receive benefits from this fund, together with the amounts paid employes of each company during the past year:

United States Steel Corporation, (General Offices)	$ 1,236.70
Carnegie Steel Company	367,459.09
Illinois Steel Company	85,652.50
National Tube Company	143,031.73
American Steel & Wire Co	261,263.28
American Sheet & Tin Plate Co	196,223.61
American Bridge Company	105,416.46
Lorain Steel Company	8,373.00
Tennessee Coal, Iron & R. R. Co	18,821.95
Federal Shipbuilding Co	338.40
Universal Portland Cement Co	1,282.15

Average cases, 1911 to 1923, inclusive, show the following: Age, 66.39 years; service, 31.60 years; monthly pension, $26.90.

Extend Tax Filing Date

The Bureau of Internal Revenue, announced an extension to June 15 of the date for filing tax returns of domestic corporations. Representations had been made by many concerns that they could not complete the preparation of returns in time to file by March 15.

John M. Egan Promoted

John M. Egan of Chicago has been elected Vice-President of the Missouri Pacific Railway, and on March 1 will be placed in charge of operations as General Manager, according to an announcement by L. W. Baldwin, President of the Company. J. F. Murphy, General Manager, who has been in ill health, has been granted a leave of absence effective March 1, and it is understood his resignation will be accepted Sept. 1.

To Represent Silk Association

The Silk Association of America has secured the services of Dr. James Francis Abbott who will sail for the Orient on March 2, as the special representative of the Silk Association in Japan. Dr. Abbott has spent over twenty years in the Orient and is an authorized authority on the economic and commercial conditions in Japan. For the past five years he has served as the Commercial Attache to the American Embassy at Tokyo from which post he recently resigned.

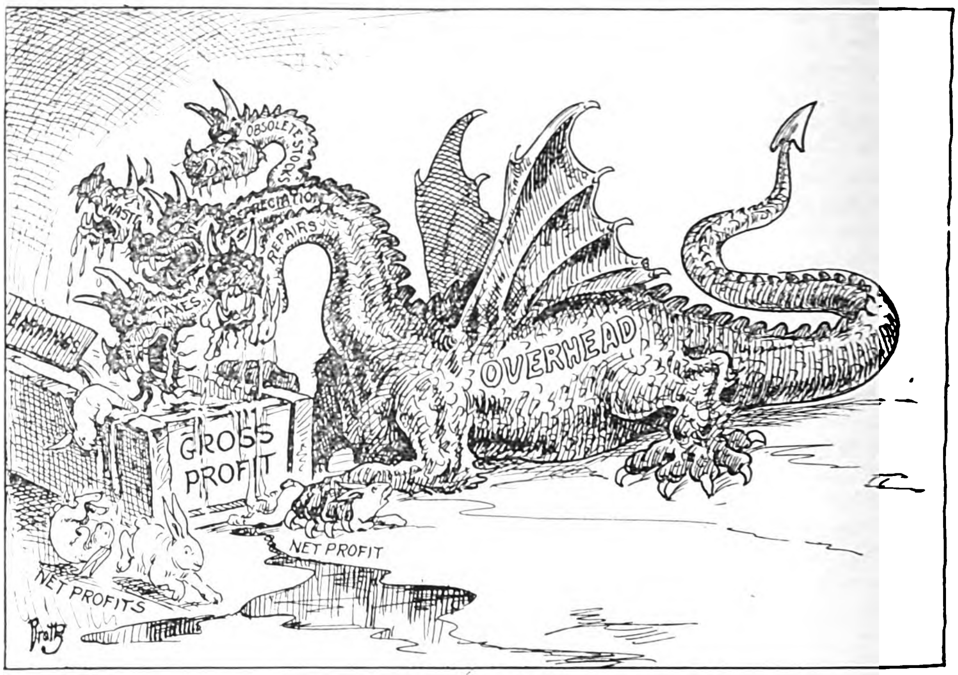
Hydra-Headed Dragon "Overhead" Gnaws Vitals of Business; Economy Will Save

By FRANK M. BYERS
Manager, Midvale Farm,
Moline, Illinois

OVERHEAD. What is it? It is a many-headed dragon eating at the vitals of business. The wealth of America has blinded the average business man to the value of the dollar. We are all trying to run our trains on the million dollar main line, disregarding the dollar feeding side-tracks.

figure out your net profit on each piece. Every $100 saved would have added an equal amount to net profit.

What percentage of gross income can a business afford to pay in taxes? What percentage can be paid for repairs, management, advertising, and what not? At what point in the development of a business is it more economical to have special advisors in every line, or hire that work done? Day by day in every way the tax head of the dragon is growing larger and more vicious.



Hydra-Headed Monster "Overhead" Devouring "Net Profits"

Ten years ago a concern that could do a million dollar gross business was a comer. To-day the same concern is losing money on a million dollar gross.

A certain railroad president once said, "I never do anything that I can get anyone else to do." That idea has been taken up by office boys and minor executives and worked overtime.

A very small amount of money may mark the dividing line between profit and loss. Consider a unit amount of money, say $100. In your business it may be your total net profit for the year. If your sales were a thousand pieces of goods, The other heads are developing insatiable appetites.

Observe a man in business for himself. How ambitious he is to save every minute and every scrap of material. How careful he is with every piece of equipment. No hot-boxes in his shop. He is a 10-second man after every loose cent. Talk over this matter of waste with your employes. A lot of them think that, because you are a big business, you have money to burn.

Rescue your rusty sword of economy from the scrap pile, and take a vigorous slash at this monster. He is everywhere about you.

Facts Will Reduce Risk In Industry

Business Engineer Turns Searchlight of Investigation On Knotty Problems of Executive—Methods of Work

HIS is the second and final installment of Mr. Huntington's article on "Reduc- the Risk in Business."—Editor's Note.

II

By WM. CHAPIN HUNTINGTON
Business Engineer and Counselor,
Chicago, Ill.

MORE and more business men are reaching out for new sources of information. Many are subscribers for the various business "services." A wide cle are readers of the Government blications.

Nevertheless it must be confessed that any have found their first experience sappointing; they have failed to get out the attractive tables of figures and the aphic charts and colored diagrams any- ing that seemed to apply to their par- ular difficulty.

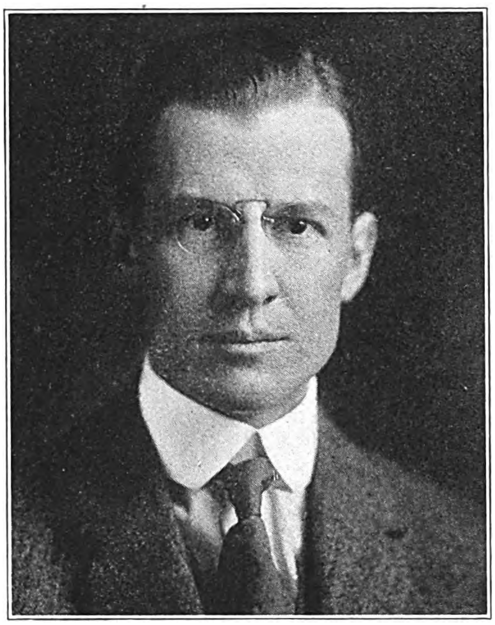
After all, statistics in themselves are no yal road to success in reducing the risk business. The figures must be interpreted by a trained man in order to be of ractical use to a business concern. Balance sheets mean little to people unaccustomed to using them. A profit and loss atement, prepared in detail by the best ccountant, carries no message to one unmiliar with its terms.

Statistics aren't the whole story anyway. or what are they but experience that has een reduced to numbers? There is a lot f experience mighty essential to forming business policy that cannot be satis- actorily expressed in figures. Moreover, here are many industries and lines of usiness on which no statistics have ever een collected.

Big Business has long understood this. The giant corporations have created departments whose job is to centralize all the wealth of statistics and information that is being poured forth from the various sources, in addition to that which is dug up by their own trained investigators. They boil it down, assimilate it and furnish it in pellet form to the department executives who need it.

Such work is expensive and entails highly-paid specialists with large staffs of assistants. The moderate-sized concerns, which constitute the great majority of our business organizations, cannot afford the outlay required. The expenditure for this kind of insurance against risk is too great for them. Yet these are the concerns which most need the facts, and it is their need that has given rise to a brand new profession, that of the Business Engineer.

The members of this new profession are a group of seasoned men who have had long and thorough enough contact with the great game of business to be very humble about what they themselves know. They do not pretend to tell the business man with twenty-five years of experience in his line how to run his business. Their sales talk is rather that they know one business alone and know it well, the business of getting just the facts and all the facts that an executive needs to answer some pressing question. Generally it is not only inconvenient but impossible for a busy executive to leave his desk and drop the threads of operation to go out and get the information himself.



Wm. Chapin Huntington

Asked the other day to tell just what he did, a Business Engineer said:

"When we work with an executive on a knotty business problem, we assemble for him the experience and opinions of producers, distributors and consumers in the industry under investigation. We lay on his desk between two leather covers the views of the men he would most like to consult. We give him all the obtainable statistics and data, carefully adapted to his specific problem. We do not believe in long rows of imposing figures and pretty red and blue charts if they don't mean anything."

Some weeks ago the President of a manufacturing concern called in a Business Engineer. He said, "We are looking for a new product to help carry the overhead in our factory. I have turned down about a hundred propositions and I hope I haven't missed any bets. Now, here is one that looks pretty good. But I just can't go before our Board of Directors and render a verdict for or against, without more facts. You've got to share the responsibility with me."

Within thirty days the President had before him a cross-section of experience with the machine in question, showing that its use involved a revolutionary change in the habits of the consumers, so that in spite of the great economies it brought about, it met with tremendous human resistance. This resistance could only be broken down by an intensive and long-sustained advertising campaign, at great expense. Furthermore, the facts showed that the field for the machine was decidedly limited, and a market estimate demonstrated that sales could never be large. The verdict was that the game was not worth the candle. The company avoided an unfortunate experiment and the expenditure of about half a million dollars.

Surveys Negative and Positive

However, let no one suppose that the results of the Business Engineer's work are always negative. Of course we are grateful to him when he keeps us from losing money, but we are still more grateful when one of his surveys confirms our ideas and shows us how to make money. And this often happens. Not long ago a group of manufacturers approached an investment banker and asked him to finance a new plant to make a basic commodity. These were men of calibre and standing and they brought with them a report of their past operations and earnings. The investment banker could not fail to be impressed. But he was one of the progressive school who believe that "a well surveyed future may offer greater security than a better advertised past."

"Gentlemen," he said, " I am favorably impressed by your financial audit, but what I need to convince me of the soundness of this project is rather an industrial audit. There has never been a mill in the region you contemplate entering, and the reasons may be good or not, I don't know. Before I could tackle this proposition, I should want a business engineer's report on it."

"We have an engineer's report," replied the spokesman of the group, "and I can assure you that the raw materials are of the proper chemical composition to make a good product and that we have designed a plant on the most modern lines to produce at low cost."

"You don't understand me," was the banker's answer. "I am willing to take all that for granted for the present, but I want to know whether your new territory is not already over-sold, what the consumption of your market is, and—a most important thing—what freight rate advantage your future plant will enjoy over its outlying competitors. Yours is such a cheap commodity that a freight rate handicap incident to a wrong location might eat up all that had been saved on a low cost of production. In short, a business report is of far greater importance to me at this time than the technical report of your engineer."

A business survey was made of this project. The searchlight was turned on every corner. The project stood the test and the financing was underwritten. The investment banker's salesmen reported that they had never had more pleasure in selling an industrial bond issue, because in this case they were able to anticipate and satisfactorily answer every question that the most cautious investor might ask.

Every day anxious business men are making momentous decisions in the dark when all around them, perhaps right in their own town, is the information and experience that would clarify their judgment and reduce the risks they are taking. This information and experience only needs to be tapped.

Consults Competitors

An energetic young producer of building materials wanted to double his plant, but he wasn't sure the market would absorb the increased production. The building material business is highly competitive and in many places over-produced. A careful business survey was made of this situation. There were no statistics available and nothing written. Every bit of the information had to be gotten in personal interviews. The Business Engineer doing this work called on every important consumer of building materials in the city, and what is more, upon the competitors of his client.

"Will they talk to you?" asked his client, who was having his first experience with surveys of this kind.

"Yes," was the reply, "I have never been refused but once, and then the man told me more by his refusal than if he had consented to talk. I lay my cards on the table and they are always interested. The modern business man is keen on new things and he is even disposed to go out of his way to be helpful where he sees no prejudice to his own interests."

"I guess you didn't go to see Smith & Company," laughed the client. "They would have thrown you out of the office."

"Oh, yes I did," was the answer, "I spent two hours with their Manager yesterday afternoon."

The client was aghast.

"What did you tell him?" he asked.

"I told him frankly that you were figuring on doubling your capacity, but that before you made the decision you wanted to know whether there was room in the market for the increase. The Manager got excited for a moment and said, 'Do you mean to say you've come here to ask me for my business secrets to hand over to my competitors?'

" 'By no means,' I replied. 'Your business secrets would be of no use to me in this investigation. What I am looking for

Cement Industry's Growth Romance of Modern Business—Marquette a Leader

Robert B. Dickinson

ONE of the great romances of modern business has been the growth of the cement industry. The method of its manufacture was discovered by Joseph Apsdin at Leeds, England, in the last century, but this country was somewhat slow to see the value and economy of it as a structural material. Even in the '80's the production in America did not exceed a few hundred thousand barrels annually. A period of education in its uses continued for many years, with an increase in production each year, until now the product of the various mills, scattered throughout the country, reaches incomprehensible figures.

Robert B. Dickinson, recently elected a Director of the Illinois Manufacturers' Association, is Vice-President and General Manager of the Marquette Cement Manufacturing Company, with mills located at La-Salle, Ill., and Cape Girardeau, Mo., and main offices in the Marquette Building, Chicago. His whole business career has been spent in the cement industry, with the company of which he is now the operating head.

The Marquette Cement Manufacturing Company is known not only as the oldest cement company in Illinois, but also as one of the most progressive companies of the Middle West. They are extensive advertisers, utilizing not only magazines and newspapers but also various form of outdoor media, such as signs, posters and painted bulletins. The Company has never hesitated in breaking away from established practices to inaugurate new policies to strengthen its trade relations and better serve the consumer of Portland cement. The practice of quoting cement on a sack instead of a barrel basis was started by this Company in the Middle West.

The construction of two large warehouses, one in Chicago and one in Davenport, Iowa, are innovations in the cement industry, which permit the storage of sacked cement at large distributing centers to adequately meet the seasonal demand.

Continuous operation of its plants over long periods are indicative of well-organized management, as it is the general practice in the industry to periodically close down cement mills. The company has contributed a great deal to the contentment, happiness and safety of its employes, is thoroughly up-to-date in its methods of operation, known for its produce and service.

Mr. Dickinson lives in Lake Forest, and is a member of the Union League, Mid-Day and Executives' clubs of Chicago.

Employe Stockholders in Demand Congress Cut Tax

Employe stockholders of the U. N. Roberts Company, Davenport, Iowa, "started something" when they drafted a petition to Congress demanding "that the burden of taxation on business be lightened, that the rates of taxation be cut down, that the form of taxation be made more simple, and that no legislation be passed that will increase the taxation burden of corporations and business generally." This petition was sent to Senators Cummins and Brookhart and to Representative Harry E. Hull, representing that district.

Sample copies of the petition were scattered throughout Iowa and Illinois and it is reported that hundreds of business firms followed the lead set by the Iowa concern, their employe stockholders adapting the form to their specific requirements, and sending them to their Congressional representatives calling attention to the fact that these workers not only want but demand tax relief, both for themselves and for the business conditions of the nation. in which they are individually vitally interested.

"Our petition was originated by the employe stockholders of this Company," writes E. C. Roberts, President of the U. N. Roberts Co., "who believe that the time is past for making requests and is at hand for making demands."

Copies of the petition drafted by the employe stockholders of the U. N. Roberts Co., may be obtained from Mr. Roberts.

Production schedules call for the manufacture of between 7,000 and 8,000 Wills Sainte Claire cars during the present season. According to President C. H. Wills the company is in a strong financial position and has no debts.

Federal Reserve Big Aid to Business

System Provides Relief for Banks In Time of Stress; Energy and Ability of Business Men Maintain Credit

II.

LET us go back to what the Federal Reserve System is doing for you. As a manufacturer has a diversified market, it follows that his checks are nerally on widely scattered points. He ceives them from all over and he de- osits them in his local bank where he is ven credit, and he draws against them cordingly, and practically every one of ese items is collected through the Fed- al Reserve System.

Every member bank is required to keep per cent of its demand deposits with its ederal Reserve Bank, on which it receives o interest. That is why many banks do ot join the System—because they can ave that deposit with city correspondents nd get interest at the rate of 2 to 2¼ per ent on it—but it is this very reserve that akes it possible for Federal Reserve anks to function.

The State of Illinois was a three-day oint for the Federal Reserve Bank of Chi- ago, and the Chicago bank, by good man- gement, was able to cut the collection time own to two days. After a few months, t. Louis followed suit and made Illinois two-day point. Missouri before that time ad been a three-day point, but recently he Federal Reserve Bank of St. Louis hanged that and made it a two-day point lso. These changes alone made a differ- nce of thousands of dollars a year to com- nercial patrons, and I have yet to see any nention in any newspaper, Chamber of ommerce report, or anywhere else, of his saving to the commercial world.

The Federal Reserve System also provides a relief for the bank with good paper n its portfolio when, in time of stress, it eeds money. A bank seldom fails because ts loans are too high. It may fail with good loans if its deposits go down faster han it can collect its paper. That is when it gets into the condition where it has to borrow to keep going. It is a desperate situation when a bank with good paper in its files is unable to take that paper and realize on it and protect itself. That is the condition that existed prior to the Federal Reserve System and for actual money, even for payroll purposes, you had to pay a premium. You could not go into a bank and get currency for your checks. The nearest thing to it you could get were these "John Smith" and "John Doe" checks of inglorious memory. That was in 1907, not so long ago, when the banks were simply unable to pay cash over the counter and it was a question whether a man who had a check on a bank could not force that bank to go into bankruptcy if he was disposed to make trouble.

By R. F. McNALLY

Vice-President and Cashier,
National Bank of Commerce,
St. Louis, Mo.

THIS is the second and final installment of an address delivered by Mr. McNally before the Southern Division of the Illinois Manufacturers' Costs Association on "The Manufacturer and the Banker."

We are never going to have anything like those currency panics again because the bank that has good paper in its files can take it and get currency for it, even in the hardest times. The Federal Reserve System has demonstrated that we can put currency out when there is need, and it automatically retires the unnecessary surplus when there is no longer need for it.

The preservation of the System is a matter of great importance, for those who are familiar with the financial history of this country will recall that at one time we had a Bank of the United States—the country was more compact in those days—and it functioned for twenty years. Then the voice of the demagog was heard in the land and it went out of business when Congress refused to renew the charter. Conditions became so acute that another Act was passed creating the Second Bank of the United States which functioned for another twenty years; but the politicians got busy again (perhaps some of those connected with the Bank were unfortunate in choosing to fight the politicians with their own weapons), and finally Andrew Jackson, whose word was law in those days, said it had to go out of existence and it did. Those banks were intended to serve commercial interests of the country, and they did a pretty good job of it, but the voice of the unenlightened was so powerful that it prevailed over everything else and they had to close.

Now, do we want that to happen in our Federal Reserve System? I cannot tell all about the System in the time allotted me; I cannot explain the minute detail by which the banks were created; I cannot map out the twelve regional districts comprising the System; of the Board that governs each Reserve Bank, which is made up of three representatives elected by the banks holding stock, three business men elected by the bank and the other three appointed by the Government, so that every protection will be given to the interests of the bank and its depositors.

Big Revenue to Government

The banks that hold stock in the Federal Reserve System are limited to a 6 per cent dividend and all the money that is made outside of this dividend goes to the Government in excise taxes and millions of dollars have been realized by the Government from this source of revenue. It has been a good thing for the Government and it certainly has been a good thing for the banks.

And now in the papers from the South we read that the deflation caused by the banks is what made cotton sell so low, and the papers up North say that the policy pursued by the banks has made wheat so low that the farmer has to sell at a loss. If anything wrong happens, the Federal Reserve has to bear the burden, and if anything good happens it is because of the native ability of the business man and the farmer which enables the Federal Reserve System to prosper.

There has been so much criticism of the System, so much radical talk along these lines and so much general ignorance of the good of the System, that the Committee at Washington was of the same opinion as myself—that until more of an effort was made in our schools and in our associations of business men and among the people as a whole to get these facts home, the System itself is in great peril either from the failure of Congress to pass an Act providing for the renewal of its charter eleven years from now, or the danger of tacking amendments on to it that will completely emasculate it or defeat the purposes for which the System was created. I am not speaking as an alarmist, but what I am saying has been said by others much better informed on the subject than I am, and if in what I say there is anything that you will take home and ponder over, I will feel I have done something worth while.

U. S. Master of Situation

I was very much interested in the November monthly letter gotten out by The National City Bank of New York, which presents economic facts in an unassailable way. It says that, while it is true conditions on the other side are most discouraging, while it is quite likely England will not be able to buy the raw material it used to nor can it work it up and transfer it in its ships to the four corners of the world, it does not mean that America is unable to get the right kind of return for its products. If production over there is to decrease, then production over here will increase, and if England does not want to send the exports manufactured from our materials over the world, then America will enter into the markets of the world and handle the goods that other nations are unwilling to handle or cannot handle.

We are not going to have an exportable

he Present Federal Tax Situation*

Sound Revision, Not Politics by Congress, Is Needed to Benefit Business—Main Features of the Mellon Plan

II.

THE next outstanding feature of the new law (Mellon Tax Reduction Plan) is its proposed reduction of rates. The present normal taxes are changed m 4 per cent and 8 per cent to 3 per cent d 6 per cent respectively. Surtaxes do t begin to apply until the net taxable inne reaches $10,000. The rates applying ge from a minimum of 1 per cent on the st $2,000 in excess of $10,000 to 25 per nt of the amount in excess of $100,000.

These reductions are expected to bring ore revenue from the larger incomes, hich are escaping through tax-exempt curities. Whether the reduction of surx rates will stop this flow of capital into x-exempt securities cannot be foretold th any degree of accuracy. Municipal, ate and Federal bonds and notes are acpted as the safest security investments. or this reason alone large investors will ways be attracted to them. It is common nowledge that capitalists and large estes and trusts are converting their assets to tax-exempt securities as quickly as ssible.

The country needs this wealth in regular annels at once. The 25 per cent minium surtax rate will average up the loss, ue to the lower return from tax-exempts. hus a surtax of 25 per cent with the noral tax of 3 per cent and 6 per cent, pplied to an earning of 6½ per cent, will ust about provide a net return of 4½ per ent, which is the estimated average return rom good tax-exempts. Thus, the excuse or buying tax-exempts by the man with he large income of $100,000 or over, will e eliminated. The individual with the maller income, which does not reach the aximum rate, cannot afford to buy the ower return tax-exempts. He will suffer loss if he does not buy the industrials, tc. One can confidentially predict that, hould the country be so fortunate as to et a 25 per cent maximum rate, large mounts will be released from tax-exempts o flow into the channels of industry.

There are pending before Congress several bills providing for an Amendment to he Constitution taxing municipals, state nd Federal securities. The most notable ne is in the form of a resolution introluced by Representative Green of Iowa. It is noteworthy that the same resolution was introduced by Mr. Green at the last session of Congress, and was passed on Jan. 23, 1923, by the House, by a vote of 223 to 101. This may be an indication of the attitude of Congress toward such a measure.

By ARTHUR ANDERSEN

Arthur Andersen & Company,
Certified Public Accountants

The Amendment is a remote possibility. If it is passed, it may be five years before it may be effective, and in any event can only cover future issues of state, municipal, or Federal securities. Many arguments will be advanced against it. State's rights will be a point of contention, particularly in the South. Action on the Amendment will be delayed for the reason there is a lack of human appeal in the measure—there are no slaves to be freed—no liquor to be confiscated—no women to be enfranchised. Viewing the matter generally, it is extremely doubtful if such an Amendment will be passed. The reduction of the surtax rates to a maximum of 25 per cent appears to be the logical solution for combating the loss of revenue through tax-exempts.

Aside from the reduction of normal and surtax rates, the provision of the proposed law providing for a further reduction of 25 per cent in the tax on earned incomes, is becoming one of the most popular provisions in the Act. Earned income is defined to mean wages, salaries and professional fees. In other words, the measure for determination of what is earned income is the distinction made in income from personal services rendered and income from capital invested. The administration of this section is expected to be fraught with many difficulties in making this distinction. It is specificially set out that the 25 per cent reduction applies only to the proportion of total tax which the earned income bears to the total taxable income.

I will pass over the remainder of the proposed Bill to the changes in administration.

As I pointed out before, the paramount injustices and injuries in income tax result from the administration of the Act. Summed up briefly they are due to the combined judical and executive functions reposing in the office of the Commissioner.

Discretion of Commissioner

Beginning in 1917, the Commissioner was confronted with the colossal task of making decisions which determined the final tax liability—valuation of property paid in for stock, valuation of property received in exchange—March 1, 1913, value of property sold—reasonable rates of depreciation and depletion—and many other vital points, all left to the discretion of the Commissioner, which in reality, meant the individual members of the Income Tax Unit.

No two persons will value an article on the same basis or worth. If they did there would be no exchange of property. Attempting to decide the fair value entering into transactions was the beginning of the difficulties in the Unit.

I can best illustrate this point by the following conversation which occurred in one of the Engineering Valuation sections of the Bureau:

> Taxpayer: "This matter of determining the proper depreciation rate is only a guess at the most. My guess certainly should be as good as yours."
>
> "Quite right," replied the Bureau's representative, "but we get the last guess."

Secretary Mellon has proposed the creation of a Board of Tax Appeals. Very little information has been given in the press relative to the functions of this Board. It was my privilege to be a member of the Committee on Taxation for the Chamber of Commerce of the United States. The Sub-Committee on Tax Administration, of which I was Chairman, made a thorough study of the functions of this proposed Board.

You are all, no doubt, familiar with the Committee on Appeals and Review which represents the Commissioner for final decision of contested points. The functioning of the Committee has been unsatisfactory in a number of cases. It has been impossible to divorce the Committee from the influence of the Bureau. The taxpayer has not always had an equitable handling of his case. There has been a tendency to be too technical. During the fiscal year just closed the Unit assessed the total amount of $460,000,000 in additional tax for prior years, and at the same time issued certificates of overassessments and allowed claims for credit and abatement in the sum of $440,000,000. The net gain in additional tax was $20,000,000.

Must Have Inspection

We cannot do away with the inspection of returns. This police power is necessary. The psychological effect upon the country makes the administration of the law nearly 100 per cent effective as is possible.

Much of the additional tax assessed in the past has been computed on more or less arbitrary adjustments. The taxpayer has been subjected to much additional expense in connection with such adjustments.

The creation of the Board of Tax Appeals, if carried out under the plans proposed, should have a material effect in changing the attitude of the Bureau. In the first place, the Board is to be entirely separated from the Bureau. It is to be the final tribunal (outside of an Appeal to the courts), before which the taxpayer and the Bureau must appear in the same manner for final decision on contested points.

---

*This is the second and final installment of an address delivered before the Fourth Tax Congress of the Illinois Manufacturers' Costs Association.

To Better and Increased Business

Letters of high character are more productive and cost no more.

Forty years of experience and service have equipped our organization to produce effective result-getting literature and direct mail campaigns.

We are fully equipped to do any kind of printing or letter work.

Our mailing lists are up to date, which insures maximum results.

We will fold and mail, relieving you of all the details at less cost than if done in your organization.

Creating business where your market is can only be done by careful analysis, effective sales copy and proper presentation.

Our Staff and Craftsmen will gladly serve you.

1201 WEST LAKE STREET - CHICAGO

The proper functioning of this Board will depend largely upon its personnel. Provision is made to create the Board of from seven to twenty-eight members, who possess the necessary qualifications. In order that the Board may have the desired effect, it is designed to attract the best possible men to its membership. A salary of $10,000 per annum is provided for and the tenure of office is placed at ten years. It is expected that the personnel will be made up of high caliber men, having broad business experience. Appointments will be made preferably from men outside the Government employ. Thus constituted, its attitude should be tempered by a keen appreciation of the taxpayers' problems. All cases will be decided upon the evidence presented, and not on a basis of how the amount of tax is to be affected. The psychological effect of such procedure should immediately forestall arbitrary adjustments on the part of the Unit.

Final authority will be centralized and the uncertainty as to when a case is closed will be minimized. The taxpayer, however, will not suffer the loss of his rights to have the case reviewed through court action. The Bureau also may take exception to the findings of the Board and bring an action in court. Such exceptions taken to the decision of the Board may not be used to delay the assessment and payment of any tax found due. It is provided that any tax due upon the decision of the Board must be assessed and paid.

The Board is not to be a fixture in Washington. It is provided that three or more members may be apportioned to special work, and their decision is to be final unless the Chairman of the Board calls for a review by the Board within thirty days of such decision. These sub-divisions may be sent to regional points to hear appeals, thus alleviating the taxpayer of considerable expense in presenting his protest to the Bureau's action.

This leads me to the subject of decentralization of administration, which has been brought into prominence through much discussion in official circles. Little hope can be entertained for much progress towards decentralization until the audit of the returns becomes current.

The Bureau has a great many 1917 cases uncompleted. A drive for the past year has been made on the 1918 returns, but a very large number of them will be unfinished by the time the limitations expire. The Bureau is asking for waivers in all 1917 and 1918 cases where the taxpayer wishes to appeal from the findings of the Unit. The appeals take up a great deal of time in the Bureau, and the Board of Tax Appeals, by being more flexible and independent of the Bureau, is expected to greatly expedite this portion of the work.

The 1919 returns have received some attention, and a considerable number of 1920 and 1921 returns have been completed. Practically nothing has been accomplished in the way of auditing the 1922 returns. It is estimated that it will be two or three years before the work is appreciably current. It is apparent, however, that a great many of the excess profits tax returns will be held open for several years through waivers, amended returns and claims.

One deplorable condition existing at Washington in the Bureau is the lack of proper housing facilities. The Income Tax Unit is located in six widely scattered buildings. The delay and expense coupled with much duplication of work, incident to transferring cases from one division to another, is enormous. A great many deficiencies of the Bureau can be attributed to this Nemesis. If a taxpayer has much contact with the Bureau on a case he can transact his business and negotiate an extensive sight-seeing trip at the same time. Congress has been apprized of this condition many times. The Commissioner of Internal Revenue, in his annual report for the year 1923, and the Tax Simplification Board have forcefully brought this condition to its attention and it is hoped it will not be lost sight of in the rush of politics.

Poor Salaries, Big Turn-over

Another matter is of vital importance in viewing the present Federal tax situation. The Bureau is dependent upon a large force of technically trained employes. Some of the best accountants, attorneys and engineers in the country today have been connected at one time with the Department. They did not stay because the salaries were not commensurate with the class of work. More lucrative positions were to be found outside, and it was nearly always that the best and most efficient men were chosen. This has a decided effect on slowing up and reducing the efficiency of the Bureau. The finance plan should be stabilized and the periodical threat of reduced appropriations, which has such a deleterious effect on the morale of the Unit, should be eliminated. If the proper salaries were paid the good men could be retained and the rapid turnover prevented.

It has been a pleasure to take up with you these matters which have been so exceptionally interesting to me. My one thought I want to leave with you is that we need sound tax revision. We do not need political tax revision. From the standpoint of both economic theory and practicability, Secretary Mellon's plan of tax revision is sound and merits the unanimous support of the American people. It is not a political measure. It will undoubtedly lose more votes than it will gain. But it is what the country needs, and what we should get. Immediate benefit is promised. The Committee on Ways and Means has approved a 25 per cent reduction in personal income taxes assessed on 1923 incomes, which would result in a reduction in the 1924 liability of American taxpayers of an estimated amount of $225,000,000.

It is evident the people are becoming alive to the situation. Organization upon organization, convention upon convention, have unanimously supported the Bill and have expressed in no uncertain terms to Congress their approval.

)emocrats Defeat Mellon Tax Plan

Combination With LaFollette's Progressives Forces Surtax Revision Upward—Republicans Out-generaled

Washington, D. C., Feb. 20.—Secretary Mellon's Tax Reduction Plan, so far as it relates to the fixing of maximum surtaxes at 25 per cent, has been defeated in the House of Represen- .ves. So apparent was the menace that Republican leadership definitely aban- ıed it several days ago. Sight of the tax ht this week has, however, been almost irely overshadowed by the sensations ‹ploded" before the Senate Oil Investi- ting Committee. Frank A. Vanderlip's ɔerience before that body may have a utary effect on deterring further volun- :rs who, out of curiosity or otherwise, nt to get suspicions aired in public.

REPUBLICANS OUT-GENERALED— :publican members of the House found :mselves out-maneuvered politically and rliamentarily by the Democrats in the ɔuse on the Tax Reduction Bill. There ver had been a chance to pass the Mel- ı Plan, providing a maximum surtax on :omes of 25 per cent, through that body. ıe only practical compromise that has en possible at any time between the Re- ıblicans and the Democrats has been on maximum surtax rate around 35 per cent. ıis possibility was not dictated so much cause 35 per cent was about the half-way ark between the Mellon proposal of 25 :r cent and the Democratic proposal of per cent, as it was by the fact that the st time the House dealt with surtax rates voted for a rate of 32 per cent. However, e Progressive Republicans in the House, ımbering about seventeen members, defi- tely announced their decision to vote, st, for the retention of the present maxi- ım surtax rate of 50 per cent, and, second, iling to get that, for the Democratic oposal of a maximum surtax rate of per cent. The Republicans were admit- dly many votes short of a majority for the per cent rate in the Mellon Plan and they on found they could not get a majority the House to support even the original mpromise plan on 35 per cent. Both the emocrats and the Progressives said the ne was too late for such a compromise.

MELLON PLAN ABANDONED—As a irect result of this practical situation, e Republican leadership definitely aban- ɔned a finish fight for the Mellon Plan. ıasmuch as amendments to the pending ill were first in order, the Progressive epublican plan for a surtax of 50 per cent ıd then the Democratic plan was voted ı. LaFollette Republicans voted with the emocrats for the Democratic plan. While

By JOHN M. TOWNSEND

Washington Correspondent,
Manufacturers News

the Democrats, originally, were forced into the position of willingness to compromise downward from their maximum surtax rate of 44 per cent, the split in the Republican ranks forced the Republicans not only to raise their position from 25 to 35 per cent surtax at the outset but to prepare to compromise upward from that figure. It has been understood all along that the Administration preferred to have the original Mellon Plan defeated in the open in the House rather than in the Committee, and that it desired amendments to the Tax Reduction Bill made in the open. This was done, and the Republican members of that body, who do not like the political consequences involved in the broader viewpoint of President Coolidge, are trying to find cover at the last minute. It yet remains to be seen whether this can be done.

SENATE PROSPECTS—It is the hope of the House leaders on both sides that the Tax Reduction Bill will reach the Senate not later than the end of next week. While a considerable number of Democrats have publicly promised fair consideration of the Mellon Plan in that body, there are certain practical conditions there which do not make the outlook any too good. In the first place, the Democrats have been heartened by the success of the Democratic strategy in the House. The rank and file of that party, provided the Progressive Republicans in the Senate are willing to support the Democratic bill after their own is defeated, would like to see what President Coolidge would do with a Democratic bill which definitely reduces taxes on all low incomes and keeps high rates on higher incomes. The political situation in the Senate is exactly the same as it is in the House, the Progressive Republicans, under the leadership of LaFollette, holding the balance of power. Finally, the last time the Senate went on record on surtax rates it voted for 50 per cent rates as a maximum. True, a large number of Senators so voting rushed to the House and demanded that the House stand pat on its 32 per cent maximum rate so as to force the Senate to come down, but the House spurned such hypocrisy and promptly accepted the Senate rates, which now prevail. To get the Senate to go *under* the rates the House will now adopt under these circumstances, will be a hefty job for anybody to accomplish. At this time it looks as though the Democrats and Progressive Republicans may write the tax rates in the Tax Reduction Bill, and it then remains to be seen what President Coolidge will do with it. It is a far cry ahead, but if the President felt called upon to veto such a measure and to carry it into the next campaign, tax reductions for the next year might have to be postponed until the next session of Congress and, perhaps, later.

PRESIDENT'S POSITION—In his New York speech President Coolidge definitely turned over the winning of the tax fight to the people. He frankly called attention to the situation in Congress and made a direct bid for approval of his position as against the position of Congress on this proposition. While the President declared himself willing to accept amendments of a constructive nature to the pending tax bill, he showed no signs of wavering on its principles as proposed by him to Congress. Furthermore, in its defense, he made one of his clearest and most astute political presentations yet heard. The clear thinking of the President, and his faculty for presenting his case in elementary fashion and couched in language so simple as to leave no excuse for misunderstanding, has convinced his opponents in Congress that the President is a dangerous antagonist in any kind of an argument.

EXPLODING SCANDAL—Washington is the home of rumor and scandal affecting men in high places, but Washington, habituated to this kind of atmosphere, knows where to draw the line between gossip and facts better than some other portions of the country. Frank A. Vanderlip, in his Ossining speech, merely reiterated to an audience which lacked the necessary experience and background to judge the effect of his utterances, rumors which have been going around Washington for weeks. There was no proof here to substantiate the rumors and everybody knew it and forgot about it until Mr. Vanderlip, possibly with a view to taking the limelight, "spilled the beans." The rumors which Mr. Vanderlip wanted "exploded" in the hope of protecting Mr. Harding's memory, were akin to the rumors before his election concerning his lineage. No responsible party paid any attention to them until a responsible party gave voice publicly about them. While Mr. Vanderlip apparently reasoned that the best way to suppress a "whispering campaign" and to restore confidence in government was to expose the campaign and falsity of the scandal itself, the fact remains that the job had better been left to friends of Warren G. Harding who were closer to him than a mere acquaintance like Mr. Vanderlip. It is entirely possible that Mr. Vanderlip may have rendered a service through his experience. The Senate Committee certainly had no mercy upon him, the Democrats, if anything, being more

Are You "Behind the Times"?

Not many years ago your grandfather reaped his crops—picked his cotton — dug canals and loaded his ships by hand. He also shoveled coal on his fire and hauled out ashes.

Today — you have advanced. You have machinery to do the work your grandfather did by hand. But — do you still shovel coal and haul out ashes? In Chicago today — Manufacturers are keeping abreast of the tide of industrial advancement and *improving* their products, simply because they know that—

If it's done with heat—

pronounced in their contempt of his position than the Republicans. The same situation obtains here relative to the alleged "slush fund" which, rumor says, was raised relative to alleged stock transactions. This is another "Tom to Dick to Harry" story, so far as the Committee knows, no evidence having yet come to light concerning it and nobody being willing to sponsor the rumor. If anyone does so, there will be another Vanderlip debacle.

THE OIL INVESTIGATION—The Senate Committee having disposed of the Vanderlip "rumors," now hopes to get back on the main track next week after an adjournment of ten days. The Committee still has to hear from its experts who are examining the books of stockbrokers, from H. F. Sinclair, who has been in Europe, and from other witnesses who may be called as developments warrant. Both former Senator Atlee Pomerene of Ohio and Owen D. Roberts of Philadelphia, have been confirmed by the Senate as special Government Counsel in this investigation. Hereafter the Committee hopes to stick to the trail of "oil," but if anybody else desires to "start something" the way Mr. Vanderlip did, the Senate is ready to accommodate the volunteers.

Five Groups Control 40% of British Ship Tonnage

Almost 40 per cent of the British Empire's seagoing tonnage, equal to nearly 14 per cent of the world total, is in the hands of five groups of associated companies. This fact was brought out in a table of British steamship lines whose fleets aggregate 50,000 gross tons or more, says *Marine News.*

One group alone—that headed by Lord Inchcape—owns tonnage about equal to the whole seagoing fleet owned by Germany. The gross tonnage of the 380 vessels of this group, comprising the British India Peninsular and Oriental Federal Steam Navigation Company, the New Zealand Shipping Company, the Hain Company and the Union Company of New Zealand, totals 2,380, 293 tons.

The next largest aggregation of merchant tonnage is that controlled by Lord Kylsant, which amounts to 2,276,000 tons, exclusive of tonnage building. This group includes the Royal Mail Steam Packet Company, Elder Dempster, Union Castle, Lamport & Holt, Pacific Steam Navigation Company and H. W. Nelson.

The White Star group, including the Leyland Line, Shaw, Savill & Albion Company, Atlantic Transport Company, International Navigation Company and the Aberdeen Line, controls a total of 123 vessels, aggregating 1,310,368 tons.

The Cunard organization, embracing the Commonwealth, Dominion, Brocklebank, Anchor and Donaldson lines, has 126 vessels of 1,155,505 gross tonnage.

Sir J. R. Ellerman heads the fifth group, controlling 253 vessels with a gross tonnage of 1,126,793.

Including ships building, the fifty-eight British firms listed possess 2,184 vessel making up 13,369,302 tons gross. T world's total seagoing shipping is estimat at about 58,000,000 tons, of which ov 21,000,000 tons is registered in the Britis Empire.

Nat. Cost Assn. Issues Year Book; All Cost Men Need I

The opinion is growing that the com pilation of cost and the uses of cost info mation are the most important phases o business life today. Each year an increa ing and surprising amount of attention i being paid by business managers and co men to the proper assembling and use o cost information. Each year a significa and valuable contribution to the literatur and progress of cost accounting is mad by the *Year Book* of the National Associa tion of Cost Accountants, which is an or ganization of 3,300 cost men and busines managers in the United States, Canada, an foreign countries, with headquarters at 13 West 42nd Street, New York City. Th 1923 *Year Book* of this Association, 37 pages, has just been issued. It is by fa the best the Association has put out, an contains an accurate report of the proceed ings of the Fourth International Cost Con ference of the Association held in Buffalo Sept. 10-13, 1923, which was attended by 700 cost men, business managers and execu tives, public accountants and industria engineers. The *Year Book* contains a large amount of technical material on cost ac counting and is of value to any cost man or business manager. It may be obtained from the Association for $3.

General In Russian Army Now Watchman In Chicago

Gen. George Tcheslawsky, formerly a commander in the Imperial Russian Army, is now a watchman at the plant of the Western Electric Company in Chicago.

Descendant of a long line of Russian soldiers, Gen. Tcheslawsky served for twenty-seven years in the Russian Army, and for one year with the Inter-Allied Commission for the repatriation of Russian prisoners of war. With this latter of body he was senior allied officer over Bavarian camps. He is also a veteran of the Japanese and World Wars.

Since coming to America a few months ago, Gen. Tcheslawsky has worked in one of the Michigan automobile plants and as a porter in one of the department stores in Chicago before joining the Western Electric Company.

Japan's First Coke Plant

The first coke screening and handling plant of its kind in Japan, has recently been installed for the Kobe Gas Company, Kobe, Japan, by W. J. Sparks & Company, New York, who are United States agents for L. J. Healing, Ltd., Japan. The entire plant was designed and manufactured by the Link-Belt Company of Chicago and Philadelphia.

Enjoyment, Contentment and Achievement

By DR. FRANK CRANE

THERE are three words which seem to express the three types of civilization which the world so far has worked out.

They are Enjoyment, Contentment and Achievement.

We might say that the ideal of life in Europe is Enjoyment, in the Orient Contentment, and in America Achievement.

Of course there are infinite exceptions to this, but as broad generalities they may hold.

The European who works looks forward to the time when he shall have laid up enough money to enable him to quit work and devote himself to enjoyment.

He is still more fortunate, or so both he and his fellows deem him, if he does not have to work at all, but can live on the money that his father or his grandfather left him.

So ingrained is this in the European mind that a man can hardly be called a noble so long as he has to make his own living.

The corollary of this is that work is a misfortune, that the great masses of people who have to work are out of luck, and that only those people work who are so unfortunate or so stupid that they are not able to live upon the labors of others.

Most of the literature that comes out of Europe treats of the lives of idlers, of those who devote themselves to sports or to the artificial amusements of what is known as society.

This explains why Socialism is so strong in European countries. As a theory it is illogical, but the real force of it is a protest against idleness as an ideal.

In the Orient the ideal is Contentment. Buddhism, the prevalent Eastern religion, emphasizes this virtue. The great toiling masses live in conditions of unspeakable poverty, yet in the main are cheerful and contented.

This makes plain in a measure "the lure of the East." For a person coming out of the turbulent conditions of life in the West and finding in China a vast population that is docile and peaceful, there is a certain charm, especially when he can live in luxury and keep many servants at little expense. All of us love to be coddled, and when we can have a whole nation coddle us quite as a matter of course the sensation is appealing.

In America we find neither Contentment nor Enjoyment as ideals. The mainspring of every American is Achievement. He thinks he is born to do something and he is not happy unless he is doing it.

That class of Americans who imitate the Europeans and spend their time in sports, amusements and social dawdling, are regarded by the general public with more or less contempt. It is not fashionable in America to do nothing.

The American finds his enjoyment in his work, not after it.

The American is proud of making his own money, and is a little bit ashamed if he is living on money that someone else has made.

An American could not be contented with the content of the Orient. He has born in him a divine discontent urging him to achievement. This discontent may make him in a measure uncomfortable. But it would make him indefinitely more uncomfortable if he did not have it.

The future war of ideals in the world will be between these three contestants, Enjoyment, Contentment and Achievement.

It will be interesting to see which will win.

TRANSPORTATION

Multiplicity of Laws Regulating Railroads Proves Expensive; Of 1,897 Introduced 277 Were Passed, in 1923

MORE laws for the control of the railroads of the country are not needed, if the railroads are to prosper financially, according to F. W. Connor, Passenger Traffic Manager of the Pennsylvania System, in a recent address before the Braddock, Pa., Chamber of Commerce. In fact, according to Mr. Connor, nearly all recent laws passed for the regulation of the nation's carriers have been expensive to railroading, adding to the cost of operating without providing additional revenue.

Mr. Connor called attention to what appears a general desire throughout the country to regulate the roads, as evidenced by the 1,897 bills which were introduced into the legislatures of forty-three states in 1923. Of this number, 277 became laws.

"While a majority of these measures were of minor importance, almost every one added to the cost of operation without providing any extra compensation," declared Mr. Connor. "Some were introduced at the instigation of labor, union and otherwise, and a number were strongly supported by the farm element. The result was that the laws were enacted regulating almost every phase of railroad operation.

"No more laws are needed by the roads, but a policy of the Government is needed which will, in effect, say to every system in America that it must stand on its own feet, pays its own way, meet and solve its own problems and then give it a fair and reasonable opportunity to do those things."

It is estimated that there are not less than 40,000,000 persons in the United States who have a part of their savings invested in railroad property. Normal working forces of the roads in this country are about 2,000,000 men and women. Their wages represent more than $9,000,000 a day.

In the United States there are about 260,000 miles of line or almost 36 per cent of the world's entire mileage.

In defense of the operating system used in this country, Mr. Connor pointed out that the advances in European rates have been far greater than in the United States. Before the war American roads gave the lowest rates and the best service and paid the highest wages of any system in the world. This condition still prevails, according to Mr. Connor.

Freight Record for 1923

A record amount of freight traffic was carried by the railroads of the country in 1923, according to complete reports filed with the Bureau of Railway Economics. Traffic handled during 1923 amounted to 457,589,846,000 net ton miles, which exceeded by 2.3 per cent the 1920 total, the previous high record. Compared with 1922 this was an increase of 21.7 per cent. The average load per freight car in 1923 amounted to 27.9 tons, or one ton above the average for 1922, but a decrease of 1.4 tons compared with the record average established in 1920.

A new high record was also made in 1923 in the average daily movement per freight car. the average for the year being 27.8 miles per day. This exceeded by 1.7 miles the best previous average, which was that for 1917, while it also exceeded by 2.7 miles the average for 1920. Compared with 1922, it was an increase of 4.3 miles.

Chicago's Union Station

The new Union Depot at Chicago, which is to be used by a number of railroads, including the Chicago, Burlington & Quincy, the Chicago & Alton, the Pennsylvania and the Chicago, Milwaukee & St. Paul, will not be opened until early in 1925. This estimate was made after a recent survey of the work that remains to be done.

Ground was broken nearly nine years ago. Total cost of the station probably will exceed $90,000,000. The project includes acres of train sheds, miles of tracks, and a monumental building which will contain a small city in itself.

Striking features of the gigantic new station include a modern jail for the detention of prisoners awaiting transportation. Travelers religiously inclined will find a chapel that will always be open to worshippers. The station will also have a morgue.

Some idea of the structure's vastness may be gained from the fact that the lobby of the concourse with the subway under Canal Street will form a single room 300 feet long and 180 feet wide. It will join a waiting room 250 feet long and 100 feet wide.

Limestone blocks for the station are all cut at the quarries and are numbered so that they may be swung into place without delay. The whole construction has been handled without the interruption of a single train. Joshua D'Esposito is Chief Engineer.

6-Year Safety Record of G. N. Ry.

Nearly 50,000,000 passengers were carried on Great Northern Railway trains more than 4,000,000,000 miles during the last six years without one being killed, according to the annual report of C. L. La-Fontaine, General Safety Superintendent.

Safety appliances maintained by the Great Northern at a cost of $1,200,000 a year, exclusive of new equipment, includes approximately 1,900 miles of automatic block signels, interlocking plants, crossing bells and wig-wags, illuminated crossing signals and related equipment which cost the company $6,500,000.

Santa Fe's Big Program

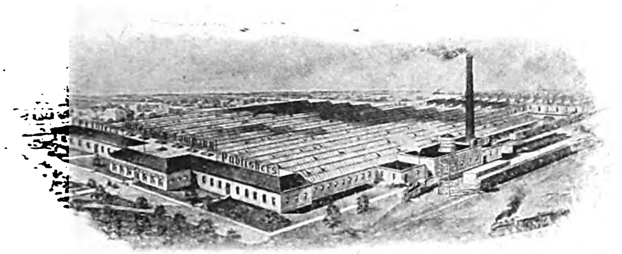
The Atchison, Topeka & Santa Fe is planning a great program for 1924 which calls for the expenditure of a large sum of money. The total program aggregates, in round figures, $81,150,000, of which probably $60,000,000 will be expended within the present year. An official statement of the Company says that in new equipment it is planned to add 2,000 refrigerator, 1,500 box and 200 air dump cars, a total of 5,200 freight cars; seventy-eight passenger cars, and fifty-seven locomotives, a total cost of approximately $22,100,000. The other improvements will be in additional trackage, new bridges, and improved track beds.

$4,700,000,000 In Freight Rates

According to the National Transportation Institute, $4,000,000 were paid to the railroads for the transportation of freight in 1922. This constituted not far from 6 per cent of the total national income. With the increased industrial activity of 1923, the freight bill was about $4,700,000,000. Freight rates had absorbed almost exactly the same percentage of the national income in 1900 and in 1910. They amounted to $1,052,000,000 in 1900, when the national income was $17,965,000,000. In 1910, they were paid $1,925,553,000, and the national income was $31,100,000,000. In 1917 they fell to 5.25 per cent, but by 1922 they were again at 6 per cent.

Electric Engineers Talk Rails

The engineering and economic aspects of transportation were discussed by railroad officials and other high authorities at meetings held in Philadelphia on Feb. 5 under the auspices of the American Institute of Electrical Engineers. Among the speakers were President Maher of the Norfolk & Western, President Budd of the Great Northern, President Markham of the Illinois Central and Vice-President Buckland of the New York, New Haven & Hartford.



What Are You Looking For From a Printer and Binder?

Equipment The necessary modern efficient machinery and buildings to economically and speedily produce the printing and binding required.

Personnel An organization of thoroughly trained men and women to operate the plant and deliver according to agreement, both as to time and quality.

Experience Forty-six years of active continuous operation under the same name and management.

Our advice is to place your printing and binding with a firm that you know has these qualifications.

Your inquiries will be given our utmost care and attention.

AND CONNECTIONS

Manufacturing Locations for Sale

Along the lines of the Illinois Northern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Illinois Northern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

FOREIGN TRADE

Protection Against Moisture Is Important Factor in Overseas Trade—Waterproof Case Linings In Packing

WATERPROOFED case lining papers play an important part in export shipping, protecting valuable merchandise against moisture, mold, odors, salt water, and other hazards brought about by stowage in the holds of ships or by the varying climatic changes in foreign countries. There are few commodities that water does not injure. Textiles are discolored and decayed, metals and machinery are rusted, foodstuffs made unpalatable and chemicals are dissolved or changed in their composition. Even canned goods may be made unsalable by the discoloration or loosening of labels. It is, therefore, necessary that the majority of export cases be lined with a tested paper that possesses the requisite waterproof qualities.

In order to place in the hands of exporters data concerning the best types of case lining papers, the Bureau of Standards, through the co-operation of the Paper Division of the Bureau of Foreign and Domestic Commerce, has submitted the following tentative specifications for waterproof case lining paper:

Composition—The paper shall be made of two layers or sheets of 100 per cent sulfate kraft paper, cemented together with a layer of asphalt.

Weight—25 by 40, 500, 120.5 pounds basis (24 by 36, 100 pounds). (A tolerance of 10 per cent will be allowed on weight.)

Bursting Strength—Average of 10 tests shall be not less than 60 points.

Tensile Strnegth—Average of 10 tests in both directions of the sheet, shall be not less than 9 kilograms.

Water Resistance—Time of penetration of water shall not be less than one hour.

The specifications given are based largely on results of investigative work on various waterproof packing papers being conducted by the Bureau of Standards. As the investigation has not been completed, the Bureau recommends that these specifications be adopted tentatively, as possible modifications may be found necessary when more complete information is available.

The weight specified is somewhat higher than in the Army specifications, but a weight tolerance of 10 per cent is included which will permit papers of 90 pounds. The usual tolerance is 5 per cent, but a higher tolerance was believed to be desirable, as the weight for such papers is difficult to control.

Panama's Trade in 1923

Panama's imports and exports of the principal commodities for 1923 show slight increases in both exports from and imports into Panama for 1923, compared with 1922, says the Department of Commerce. Banana shipments decreased, but cacao and cocoanut shipments were greater in 1923 than in the previous year. Imports and exports for the last three years are as follows:

Year	Imports	Exports (to U. S. only)
1921	$11,372,370	$2,807,993
1922	10,268,549	2,448,925
1923	11,822,167	2,572,524

Imports from the United States in 1921 represented 73 per cent of the total, 68 per cent in 1922, and 68 per cent in 1923. Thus, despite considerable efforts on the part of Europeans, and favorable exchange rates to European competitors, the United States has maintained its supremacy in Panama.

Of interest in the 1923 statistics from Panama is the item of Manganese exports to the United States, which amounted to 400 tons valued at $7,600. An American company has been actively engaged in the development of the manganese deposits for the past few years.

We Bought Much Butter in 1923

Imports of butter into the United States in 1923 amounted to 23,741,247 pounds, and exports of butter from the United States to 5,845,514 pounds, compared with imports in 1922 of 6,957,159 pounds and exports of 10,937,519 pounds and with imports in 1921 of 18,558,388 pounds and exports of 8,014,737 pounds. Denmark was the largest source of butter imports, followed by New Zealand, Canada, Australia, and Argentina, according to an analysis of the dairy trade of the United States by the Foodstuffs Division of the Commerce Department.

U. S. Foreign Cheese Trade

Cheese exports in 1923 amounted to 8,331,321 pounds, valued at $2,179,367, which was 3,324,747 pounds more than was exported in 1922, but was 3,440,650 pounds less than the quantity exported in 1921 and about half that exported in 1920. More cheese was imported in 1923 than in any previous year, the quantity reaching 64,419,788 pounds, valued at $20,887,656.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

AUSTRIA—9155, staves, plywood and veneer.

BRAZIL—9161, cement guns; 9205, hospital equipment for 100 beds, modern; 9156, machinery and equipment for the manufacture of combs and toothbrushes from hard rubber, bone, and horn; machinery for making small rubber articles such as dolls and other toys; machinery for making common pins, hair pins, safety pins, and paper clips.

CANADA—9200, distillery apparatus for wood alcohol.

CANARY ISLANDS—9206, belting, leather, transmission.

CHINA—9159, cutlery; cotton piece-goods; hardware; lumber; leather goods; leather novelties; metals; paper, such as newsprint, kraft, transparent, bond, check, printing, writing, bank post, packing, etc.

COLOMBIA—9198, cement making machinery and equipment.

CUBA—9172, automobile accessories, cement.

DOMINICAN REPUBLIC—9163, machinery for manufacturing straw hats.

GERMANY—9194, bacon; corned beef; fibers, Porto Rican; lard; tobacco, Porto Rican: 9185, pegs, wooden, shoemakers.

HONDURAS—9171, building board, fiber; 9173, brass corporation cocks, 500; cement, 1,000 barrels; fittings, electrical; motors, 25-horsepower; 3-phase, 2,300 volts, alternating current; transformers, 2,300 to 110 volts; wire, copper, transmission, 15 tons; wires, electrical.

HUNGARY—9190, copper cakes; electrolyte cathodes; wire bars.

INDIA—9184, umbrellas, cheap; umbrella parts.

IRELAND—9158, looms for silk and popline weaving requiring 30 operatives; 9193, radio apparatus, crystal and valve, cheap and medium grades.

ITALY—9149, motorcycle parts.

MEXICO—9165, cigarette making machinery with all accessories; 9204, clocks, all makes; phonographs and parts; phonograph records; phonograph accessories; 9188, repair parts for watches; watches, cheap.

NETHERLANDS—9166, flour, best quality; lard, best quality.

SCOTLAND—9192, carbon brushes for dynamos and motors; 9176, scales, spring.

SOUTH AFRICA—9162, gigs, light weight, single horse; 9160, washing machines, not electric.

SPAIN—9151, automobile supplies; automobile tools; automobile novelties; tires, automobile.

SWEDEN—9201, buckles (metal parts) for garters and suspenders; elastic for making garters and suspenders; hosiery—wool, silk, and cotton.

SWITZERLAND—9199, machine tools for the manufacture of silver.

URUGUAY—9186, cord, cotton, various sizes; 9203, cotton waste, 10,000 kilos.

YUGOSLAVIA—9167, cement for building purposes and for manufacture of tiles; 9197, yarn, for machine or hand sewing.

SALES MANAGEMENT

What Are Characteristics of Successful Leadership? Expert Names Nine Most Essential Qualifications

By NORMAN M. SWEET
Sales-Service Manager,
Manz Engraving Company

THIS is the first installment of a series of two articles by Mr. Sweet on the subject of "Successful Leadership," written especially for MANUFACTURERS NEWS. The second and final installment of this notable article will be published in the next issue of this magazine.

I

BUSINESS right now requires leaders—men of action, men who do things, men who strike straight through obstacles. There's no time for thinking things over—we must put things over. "Double-action" men are the successful leaders of the hour.

What is successful leadership?

In selecting and developing leaders for business, an appreciation of the factors and characteristics essential to efficient and successful leadership must be clearly formulated and clearly borne in mind.

The answer to successful leadership comes under the following headings:

1—CHARACTER—Integrity, resourcefulness, initiative and responsibility.

2—IMAGINATION—No man is a true leader who cannot project himself into the future. He must have ideas and ideals, in order to lead.

3—JUDGMENT—A man must have perspective to see how many of his ideals are able. He must have a scientific attitude and use good sound common sense.

4—COURAGE—Many men with good imagination and lofty ideals fail because they lack in true courage. They are timid, or they try to please everybody; hence they do not go forward as leaders.

5—EFFICIENCY—This comprehends the habits of hard work, thoroughness, and constant accuracy. True efficiency comes from native talents for a particular line of work; plus special training; plus experience; plus devotion to the task; plus generosity in the work; plus conscience.

6—UNDERSTANDING OF MEN—This is more than mere knowledge of men. This is the most crucial test of genuine executive ability. Executives must not only know human nature, have a knowledge of men, but literally understand them, and be able to sympathize with them; putting themselves in the place of those under them, and exercise a "pull" from the bottom upward and not a "drive" or "push" from the top downward. This understanding of men and wise leadership of subordinates is the real test of organization fitness.

7—SKILL—This comes from the technique of practice and of business experience generally.

8—COURTESY—Men and women are more and more grasping the business value of fair, courteous treatment. Industry always has a place for a man who is all that a gentleman should be; efficient, but human; adroit, but honorable; a lover of his fellow-men, as well as a leader with them; and who shall use his power with "gentleness," and his wealth with imagination and make his decisions from the heart.

9—SELECTION—The selection, training, and functioning of executives determine the ultimate growth and success of the entire organization. You never know just where you will unearth an "idea" man who will earn large sums for you. They crop up in the most unexpected places. This is because beneath every practical application of an "idea" lies a principle, and principles apply universally.

These nine factors constitute successful leadership. Apply them. Success is yours the moment you do.

Where are leaders needed mostly now? In the selling field. Distribution needs immediate attention. Those who delay will slip. Those who believe in "action" will win. They will be industrial leaders in the coming years. But start now.

Who are these leaders? What are their present positions, respectively?

In the order of their importance they are:

1—Sales Manager
2—Salesmen
3—Advertising Manager

What must each do in addition to his regular duties? Just one word answers this question—SERVICE.

What will the Sales Manager do from a point of real service to the sale?

He will give additional responsibilities to his salesmen. He will have them learn just what the customer wants to help them sell better, more efficiently and economically. The Sales Manager will use the data his salesmen bring in. He will issue a standard data sheet from which all salesmen will ask the same questions. From these research sales slips, he will call on the Advertising Manager, who in turn will prepare his sales service material from them. All will work from actual conditions. All will give service to the ultimate seller to consumer, and stand back of every sale. The result will mean—Repeat Sales.

Repeat Sales are the only sales worth while. They are the most profitable. We can only deal with profitable sales from now on. A sale that is an expense to make is a sale that has not been sold from a service standpoint. You very readily see that it is service-selling from now on.

EXAMPLE: A sales representative in Chicago who sells motor oil called upon the writer Nov. 19, 1923. He represents a petroleum company located in the West. He sells motor oil in 1 and 5-gallon cans. He asked how he could help filling stations in this territory sell his oils. He knows that he must help them sell, in order that he may sell.

Here is what we decided. His oil is an excellent product. He knows it. He convinced the writer of it first. He's going to get out attractive labels in colors with each dealer's name on them. He's putting his dealer's "good-will" behind his good product. His dealer's trade-mark and brand name will be on this label and the kind of motor oil will be on it, too. The most important thing is—the seller's guarantee of "what's-in-package." The buyer today wants someone he knows close at hand who will stand behind what he sells.

When the writer asked if his company stood behind him in this, he answered: "I haven't thought of asking them. I know that that's the only way I can successfully sell my product. I am going to put it over and then they're bound to see."

This is sales-leadership. You can apply this same idea.

The salesman will have to use these methods of executive selling, also—if he is to lead. He's no longer an *order taker.* He must be a *service giver.* Put service before sales. Find out ways and means to help his customer sell the things his customer buys from him. He secures the customer's account—not just an occasional order—the moment he does. Ask any buyer if he doesn't buy more from the man who gives him service. The reason is plain—the man who gives him service helps him to sell better.

Now, we have to help both the Sales Manager and the Salesmen in helping the customer sell their goods. How will we do it?

The Advertising Manager now comes on the job. He works out the right kind of sales helps. Direct advertising printed literature. He uses the information gleaned from the field. He applies this knowledge to meet each case. He sends thousands of selling messengers in the shape of good printed literature. These mighty salesmen in the form of printed literature go to jobber, dealer and consumer. They contain essentials, only. They are dynamic. They tie-in with all the facts of successful selling. They back up his general publicity in magazines, etc.

The Japanese telephone authorities hope to complete installation of telephones in 30,000 houses by next Summer, according to the *Japan Times.*

AUTOMOBILE—AVIATION

80 Per Cent of All Motor Vehicles in the World—Passenger Cars, Trucks and Cycles—Are In the U. S.

THERE were in operation in the entire world on January 1, 1924, approximately 15,763,281 passenger cars, 2,345,850 motor trucks, a total of 18,109,131, and 1,075,000 motor cycles, according to a compilation made by the Automotive Division of the Department of Commerce. In the United States the approximate total was: passenger cars, 13,484,939; trucks, 1,796,356; motorcycles, 171,568; totalling 15,281,295.

The increase in total registration of cars, trucks and motor cycles during 1923 was 3,681,178. The increase in the United States was 2,885,489, or approximately four-fifths of the world increase.

The significance of these figures is best shown in the following way:

> The United States has 80 per cent of all the passenger cars, trucks, and motorcycles in the world.
>
> Out of every six passenger cars and trucks in the world, the United States has five.
>
> In the world, there are more than six times as many passenger cars as trucks; in the United States that ratio is 7.5 to 1.
>
> The increase during 1923 in all automotive vehicles in the world was 23 per cent, and in the United States, the ratio was the same.

The "World Census" shows that all three classes of automotive vehicles increased in large measure during 1923. The figures for the world registration are as follows:

Passenger cars: 12,848,783 in 1922; 15,763,281 in 1923—an increase of 2,914,498, or 23 per cent.

Trucks: 1,763,378 in 1922; 2,345,850 in 1923—an increase of 582,472, or 33 per cent.

Motor cycles: 893,627 in 1922; 1,077,935 in 1923—an increase of 184,308, or 20.6 per cent.

Aviation in Europe

The year 1923 was an experimental year for German aviation. Basic lines of an international flying system were planned and carried through, giving Germany contact by air service with all neighboring countries, according to the Western European Division of the Department of Commerce. During the Summer of 1923, daily flights were made on nineteen lines.

The Junkers-Werke and Aero-Lloyd participated in eleven of the nineteen lines. These two firms now largely control German commercial aviation. The former accomplished 1,070,000 flight kilometers, carried 17,750 passengers and 85,776 kilograms of mail and freight, while the latter covered 274,465 kilometers, carried 2,528 passengers and 1,415,600 kilograms of mail and freight (including newspapers to and from England).

It is planned, through international agreement to extend activities during 1924. The Junkers-Werke proposes to establish the following lines: a through line, London-Berlin-Lemberg-Odessa-Baku-Teheran; a through line, London-Rotterdam-Cologne-Strassburg-Zurich-Genoa-Naples (with branches to Tripoli and North Africa)-Brindisi-Athens (and branch to Smyrna)-Crete-Port Said-Cairo; and a line from Lisbon to Madrid, Barcelona, Marseille, Genoa, Trieste, Vienna, Warsaw and over Nizhin-Novgorod to Siberia and China.

It is also planned to utilize the night for travel by a combination train and airplane service, using the train for the night portion of the journey. Where routes include a considerable journey over or along the edge of water, such as the Genoa-Naples-Brindisi-Athens-Smyrna line, the night trip will be by seaplane.

Duplex Truck Co. to Move

The Duplex Truck Company will move into its new and enlarged plant in Lansing, Mich., March 1, according to Joseph Gerson, President of the company. The old Duplex plant has been sold to the Reo Motor Car Company.

Percy Owen Goes to Washington

Secretary Hoover has appointed Percy Owen of Detroit, Mich., former President and General Manager of the Liberty Motor Company, as Chief of the Automotive Division of the Department of Commerce, to fill the vacancy caused by the resignation of Gordon Lee in June, 1923.

Winton Closes Auto Business

The Winton Company of Cleveland, O., one of the oldest automobile manufacturing concerns in the country, is liquidating its automobile business to pay off its bank indebtedness and extended merchandise creditors. Its decision to liquidate follows the failure of several plans for reorganization. The Diesel engine business of the Company will not be affected, and the General Parts Corporation, of Flint, Mich., has contracted to maintain a complete stock of parts and furnish service for Winton cars for five years.

Franklin's Unfilled Orders

Unfilled orders for cars at the plant of the Franklin Automobile Company, Syracuse, N. Y., are over two and one-half times the number on hand one month ago, according to H. H. Franklin, President.

White Co. Denies Rumor

Reports that The White Company, of Cleveland, manufacturers of motor trucks and busses, has resumed passenger car production, which it discontinued in 1917, have been definitely denied by an official statement that neither the Company nor its official or factory personnel has any connection whatsoever with the Rollin Motors Co., or any other passenger car producer. Rumors to this effect are believed to have risen from the fact that R. H. White, Chairman of the Board of Rollin Motors, was at one time with The White Company, but this has not been true for ten years.

Wear Old Clothes; Buy Autos

The average man no longer has a "Sunday suit" of clothes, but he owns an automobile or is buying one on the installment plan, according to a nation-wide survey made by the National Association of Retail Clothiers.

People don't seem to care much about clothing any more, according to result of the survey. And one state is about as bad as another in that respect, according to representatives of the Association, although Texas, Iowa, and New York seem to have become the most careless about their appearance, judging from the inquiry just made.

The survey showed Denver, Col., as a typical victim of the automobile fever, where in a city of less than 300,000 there is a registration of 51,000 automobiles, nearly one for each family.

Ford Has 200,000 Unfilled Orders

The Ford Motor Company, New York branch, has announced that 200,000 unfilled orders for spring delivery are now on hand. At the same time it was announced that the dealer organization of the Ford Motor Company is prepared, because of the season, to value trade-in cars at a higher price than in the Spring. This condition of the market has been capitalized by the New York branch of the Ford Motor Company in the buyer's favor, as through its dealers it has begun an educational campaign on the benefit of winter buying.

BUSINESS AND FINANCE

*"History and Origin of Investments"—Derivation of Term and the Growth of Interest Payments on Capital

By EUGENE M. STEVENS

Vice-President, Illinois Merchants Trust Company, Chicago

I

THE term "investment" has several other meanings than the one which we shall consider in the series of lectures of which this is the first. The derivation of the word makes its literal meaning "to clothe in or to clothe with," and this is its literal application when one is invested with the robes of authority. There is a significance in this derivation, however, which I think is peculiarly applicable to the subject we have in mind, as the suitable investment of capital clothes it with authority and with power to work for and bring gain to its owner.

The basis of investment of capital, at least in its modern sense, is that thing which we call interest, which is the measure of the earning capacity of the capital employed. Interest is today such a common factor that we accept it as we do many other things, as a matter of course, and without realization that in its present use it is of comparatively recent stage of the world's history. It is true that there was some semblance of it in the days of the ascendency of the great city of Babylon, and that a great deal of the wealth and commerce of Tyre was founded on this principle. However, in those early days there were only a very few people of wealth and little use for capital for productive purposes. The great masses of people were without property and without much mentality, and such money as they might acquire by borrowing was for wasteful extravagance. They could give no property security and hence arose the custom of giving their own persons as security. This inevitably led to a form of slavery on non-payment of debts. This is probably the origin of the prejudice against what were termed "usurers."

The early Mosiac Law prohibited a charge of interest between Jew and Jew, and later the Christian Church also forbade such a charge. Aristotle, the great Greek philosopher, said that interest was essentially immoral, and it was not until the reign of Henry VIII in England that the charge of interest became legally recognized. The Jews, who had been the great money lenders, were regarded as a necessary evil and their standing in society was almost that of an outcast.

Civilization has reached a development where, in a large measure, the wasteful personal extravagance of low mentality has been replaced by a sober self-restraint, and capital borrowed may be employed to productive advantage, and with this development has come a change in the conception of the use of money and the position of the money lender, and he and his function have come to be recognized as an essential and honorable factor in the world's industry and commerce.

Fundamentals of Financial Investments

BY special arrangement with the Y. M. C. A. School of Commerce and the Investment Bankers' Association of America, MANUFACTURERS NEWS will publish on this page each week addresses delivered by some of Chicago's leading financiers and investment experts before the Y. M. C. A. School of Commerce.

There are sixteen of these lectures, covering practically the entire field of investment of capital, beginning with Mr. Stevens' article dealing with the history and origin of investments, through the minute detail of the fundamentals of all classes of investment.

These lectures are exceptionally informative and are authoritative, and should be of much interest and value not only to the general student of finance but also to the corporation executive, who must constantly deal in matters of industrial investment.

MANUFACTURERS NEWS believes it is giving exceptional service to its readers in the publication of these articles.

As civilization progressed and men began to accumulate in goods beyond their own personal needs and to store commodities for future use, and as the old custom of barter or exchange of commodities for commodities was gradually replaced by the use of money as a standard of value to be used in purchases and sales, there came to be a gradual accumulation of capital in the hands of the thrifty and prosperous. This began to be used by the owner in loans to his less fortunate neighbor, and gradually, through association of men together or otherwise, there developed what we now call the investment of money in enterprises in which the owner is not himself necessarily engaged, either through the medium of loans or by the accumulation of shares of ownership. Thus capital and wealth began to accumulate and seek channels where it might have an earning power for its owner.

The use of accumulated capital may take many forms. It may be used in gambling, which is pure chance with no possible foreknowledge or control of the result and this, of course, is the lowest form of its application. It may be used in what we call speculation. This may be a little higher form of investment than pure gambling, but at best is based on probable chance and is, in every instance, dealing in future prospects rather than established history. In practice, the speculator rarely has the real fundamental knowledge necessary to enable him to judge the future of the intricate situation on which he is taking a chance, and speculation, therefore, is often in practice only another form of gambling.

(To be continued next week)

American Can Earns $19.64 a Share

American Can Company reports for the year ended Dec. 31, 1923 a net income of $10,983,094 after charges and federal taxes, equal after preferred dividends, to $19.64 a share on the $41,233,300 of common stock. This compares with a net income of $10,433,350, or $18.30 a share on the common stock in 1922. American Can's working capital Dec. 31 last was $41,230,247, against $37,069,792 at the close of 1922.

U. S. Gypsum's Report

Net earnings of the U. S. Gypsum Company during 1923 amounted to $6,848,941 and the dividend payments to $1,601,668, leaving a surplus of $3,429,253, as against $2,080,493 in 1922. In the last three years the Company has added $6,420,333 to the surplus account, which at the end of 1923 stood at $9,045,048, or only $2,886,942 less than the total capitalization of the Company. It has no funded debt. Net assets applicable to the 295,584 shares of common stock is equivalent to $50.60 a share after allowing for the preferred.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

URING the last thirty years motors in sizes ranging from 1,200 horsepower those rated at 30,000 horsepower or re, have been installed and are now forming work equivalent to manual la- of 170,000,000 men," says Gerard ope, President of the General Electric npany.

"Electric lighting is one of the few com- dities that have steadily decreased in t from the beginning. The aggregate these improvements, together with the luction in cost to produce electricity, has luced the cost of a given amount of light 5 per cent of its cost in 1880.

"Rapid transit through electric trans- rtation already has been of inestimable lue to industry by making it practicable men and women to live at greater dis- ices from their places of work, thereby sisting in great measure the spread of pulation.

"Engineers estimate that the complete ectrification of American railroads uld save more than 100,000,000 tons of al a year.

"The development of steam turbine gen- ators has shown a steady increase in the wer of each unit. In 1907 the capacity d increased to 20,000 horsepower, in 11 to 27,000 horsepower, in 1917 to 60,- 0 horsepower. The latest machine has ,000 horsepower capacity, or more than even time that of the first. Through tur- ine installations in power plants 90 per ent more energy was obtainable from a ound of coal in 1922 than in 1902.

"It is frequently said that we are living an electrical age. When it is considered hat a small proportion of the water power f the United States is utilized for the gen- ration of electrical energy and what em- loyment of this water power would mean n the conservation of human effort in min- ng, transporting and distributing the coal; when it is considered that only 55 per cent f the manufacturing establishments and nines in the United States are operated by lectricity and that but 38 per cent of the eople of the United States are living in lectrically lighted homes and that only a still smaller proportion are using electrical appliances, it will be seen that the future promises for this great industry even larger growth and expansion than have yet been realized."

Spend $5 for $1 of Revenue

Latest United States census reports show that in 1919 the gas industry spent $4.45 for additions to plants and extensions to mains and service facilities for every dollar's worth of gross revenue that it obtained, while the average of industries other than utilities was 71.2 cents. Five years previous the ratio was $5.69 to 94 cents, and today it is about $5 to 75 cents.

Peoples Gas Officers Re-elected

Stockholders of the Peoples Gas Light & Coke Co., at the annual meeting, reelected returning directors. The Board then reappointed the following officers:

Samuel Insull, President; Charles A. Munroe, Vice-President; Theodore V. Purcell, Secretary; George F. Mitchell, Treasurer; William A. Sauer, Comptroller; Walter I. Coble, Auditor; Robert Blair, Assistant Secretary; Albert L. Tossell, Assistant Treasurer; and William R. Weldon, Assistant Treasurer.

Elevated Breaks Passenger Record

Chicago's Elevated Railway System, now the Chicago Rapid Transit Company, broke all records in 1923 for the number of passengers carried. The record of each division for the last two years follows:

Union	1923	1922	Av. 1912-21
Loop	203,943,551	181,283,785	178,606,652
S. Side	56,979,733	51,933,381	52,486,078
North W.	64,423,486	56,969,504	52,214,980
Metrop'n	62,365,733	54,701,764	56,607,663
Lake St.	20,174,599	17,679,136	17,297,931

New Street Cars for Detroit

The General Electric Company has recently received an order from the City of Detroit for 100 4-motor car equipments for use on new cars to be operated by the Municipal Railways of that city. They will be installed on Peter Witt double truck type cars, duplicates of 250 such cars now in use. The order calls for No. 265 motors with K-35 single and control and CP-27 compressors. Fifty complete air brake equipments were also ordered.

Prize for Artificial Lightning

The Thomas Fitch Rowland prize for 1923 was recently awarded F. W. Peek, Jr., Consulting Engineer of the General Electric Company at its Pittsfield, Mass., plant, by the American Society of Civil Engineers in annual session at New York. The award was made in recognition of a paper presented before the society in San Francisco on "High Voltage Power Transmission." Mr. Peek gained national prominence last Fall with a spectacular demonstration of 2,000,000 volt artificial lightning, striking buildings of a miniature village constructed in the General Electric laboratories at Pittsfield. Later, he showed before the Franklin Institute in Philadelphia how the true voltage of a natural flash of lightning could be measured, following his laboratory experiments.

Telephones In Minneapolis

The City of Minneapolis has in proportion to population, nearly 5 times as many telephones as London, over 7 times as many as Liverpool and over 29 times as many as Naples.

"I'm Safe and Sound, Mother, and I Had a Splendid Trip!"

WHEN you reach your journey's end call home by long distance telephone and let the home folks know that you arrived safely. It relieves their anxiety and will make your visit more pleasent.

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

Federal Reserve Bank Is Important Aid to Industry

(Continued from page 9)

surplus accumulate by reason of lack of purchasers on the other side who are unable to pay for what we send them, even though they are willing to buy. We are the masters of the situation. It is up to us to create new markets and we can, if we wish, even create the markets to which our nation is entitled, if we do not already have them.

While this is a subject worthy of lengthier discussion, I cannot help but think in conclusion that, if there is one thing that stands out in the economic history of the United States and which will at some time be pointed to by the historian of these stirring times as being indeed worthy of note, it is that with the world struggling under the heavy and unprecedented burdens of taxation and debt, the resourcefulness, the energy and the business ability of the American business man have made it possible for us to keep on doing business on a gold basis with our dollar worth 100 cents, our credit unimpaired and our record of achievement unparalleled.

Let us keep up the good work, and, with changing times, continue on our progressive march so that the terms "American manufacturer" and "American business man" will continue to be titles of distinction and inspiration and encouragement to the generations that will follow.

Facts Will Reduce Risk In Industry, Says Engineer

(Continued from page 8)

are the broad underlying facts. Facts of which you have some, Jones has some, and Brown has some more, but of which no one of you has all. I want to know how much material this market consumes, is the consumption increasing, can we do any missionary and publicity work with architects and builders to widen the market. When the car shortage is relieved, will the powerful producers over at X— come in and drive us all out of business!'

"'Your client has got no business to double his production!' said the Manager hotly, 'he will just glut the market and muddy the water, and spoil business for all of us. Why should I talk to you anyway?'

"'You've just told me why,' I replied, 'I am out with an open mind to get the truth. If you are right in your statement and can furnish me with facts which will help to deter my client from increasing his production, will it not have been worth your while to talk to me?"

"'Yes, I guess so,' he answered, and we talked for two hours. Here's his interview."

Pours Over Survey

Until late that night the producer poured over the finished survey. Eagerly he read the many interviews. He could hardly believe that all this information came from men whom he knew well and saw almost daily. Few of us realize what a wealth of experience is contained in the heads of almost any group of representative business men. Indeed, it is not until this experience has been drawn out and co-ordinated by a skillful interviewer that the men themselves appreciate how much they possess and what an opportunity they have overlooked in not exchanging ideas with one another.

To the Business Engineer every case is a new adventure. He has the nose for facts, and he loves to dig them out and piece them together just as a salesman loves to sell. The best part of his information comes, and will come for a long time, from personal contacts, and he must understand human nature and like to deal with people. Absolute honesty with himself and with others is a pre-requisite to success.

Thorough training and ripe experience are absolutely essential. This is no work for the immature. The variety of business questions demands the highest degree of ingenuity and resourcefulness. The Business Engineer dare never forget that his job is to serve business, and that he has failed if his work is not of practical value.

Given the proper equipment, the results are assured and they are results which not only bring profits to clients but contribute materially to the prevention of waste in industry.

Harvester Buys Tractor Plant

Purchase of the Emerson-Brantingham Company's tractor-manufacturing plant, including seven and three-quarter acres of land and 150,000 square feet of manufacturing and office space at Minneapolis, is announced by the International Harvester Company. The purchase is the first step in the establishment in Minneapolis of the International Harvester Company's largest motor-truck service and distributing unit and eventually a Northwest assembling plant.

Stewart-Warner Buys Rival

The Stewart-Warner Speedometer Corporation has purchased the Jones Speedometer factories at New Rochelle, N. Y. Vice-President V. R. Bucklin says that the new building at the Chicago plant adds 156,000 square feet of floor space and that the Jones Speedometer factories contain about 75,000 square feet. The Company's net profits in 1923 amounted to $6,728,119 after Federal taxes, equal to $14.16 a share on its stock, compared with $5,335,162, or $11.23 a share in 1922.

Armour Takes Over Atlass & Co.

The firm of Frank Atlass & Co., owners of the Atlass Produce Company of Lincoln, Ill., has transferred its business to Armour & Co. The transfer includes all the properties of the firm at Lincoln, similar plants at Petersburg and Carlinville and buying stations at Delavan and Mount Pulaski.

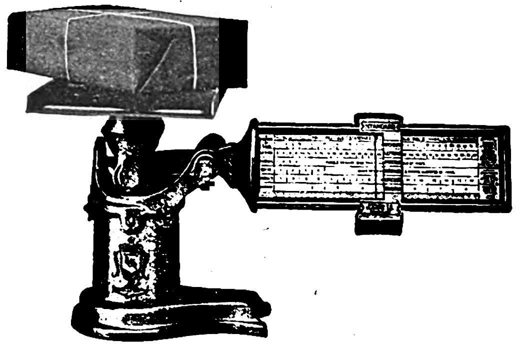
"Standard" Postal Scale
With Adjustable Beam and Interchangeable Dial



Made in Two Sizes
No. 2 "Standard" Capacity 2 pounds
No. 4 "Standard" Capacity 4 pounds

A fine wire on the sliding poise indicates the cost in cents on all different classes of mail matter.

The beam can be instantly turned by the hand to any angle, so that the dial can be read from any position.

In case the postal rates should change at any time, a new enameled dial can be mailed and inserted by anyone. This insures a perpetual scale. Warranted accurate.

The Artistry of Good Taste

THE Congress has no formula which assures the complete satisfaction of all its guests, but it has profited from experience. For many years this hotel has been famous for the manner in which it strives to please everyone. Its executives have learned there is but one phase of service which always appeals. That is Good Taste. The Congress employs the artistry of Good Taste.

Headquarters

Is it some heavy timbers you need? Something about 30 x 30, and 120 feet long? Or piling up to 80 foot lengths? Perhaps just some crating lumber? Whatever it is, in any wood, size or amount, we can fill your order with no delay.

Our stocks of some 75 million feet in our Chicago yard of 45 acres are constantly maintained by our own mills operating in our own forests. Unequaled railroad facilities and a mile of waterfront give us shipping accommodations without equal.

In Chicago and suburbs, our own twenty branch yards mean quick deliveries and smaller delivery costs.

Wire us, phone us, write us for anything any time. Our facilities make us national headquarters for lumber.

Soldier and Civilizer

IF BLOODY Williamson County redeems itself and ever becomes a fit place for a human being to live, some credit should be given to Gen. Milton J. Foreman, who commanded the state troops when they were called there to put down the last uprising a few weeks ago. In addition to being a good soldier, Gen. Foreman is a high class citizen. He held several meetings with the law-abiding people of the community. He aroused their courage and pride and community spirit, and they are now trying to run Herrin and other parts of the County like a civilized community.

Profit, The Wages of Capital

ACTION of the House of Representatives in rejecting a proposal to restore the excess profits tax is a gratifying exhibition of sanity. Wiping out profits unfortunately wipes out incentive, and wipes out at the same time business and employment. You cannot expect a manufacturer or business man to work without profit any more than you can expect a workingman to toil without wages. Representative Frear, the insurgent Republican who introduced the bill to do away with profits, was guided by mistaken politics rather than judgment or the best interests of the country, including the radicals themselves, who for this once, have been saved from hanging themselves by the sounder reasoning of their colleagues.

How to Get Your Taxes Reduced

A RECENT bulletin of the Civic Federation of Chicago, of which Mr. Douglas Sutherland is the efficient and hardworking Secretary, calls attention to a saving of $27,000,000 in taxes to the taxpayers of Chicago during the last two years. The Civic Federation has taken an active position in calling attention to unreasonable tax increases, and has aided largely in bringing about this reduction. It stands for economy in an age of extravagance in the conduct of public affairs.

The bulletin points out that tax rates for 1923 are a little higher than last year—that is to say, a little higher than ever before. Property owners are advised how they can prevent further increases which will affect their 1925 tax bills. This can be done by the taxpayers writing to their Aldermen and members of the County Board to use their votes and influence toward keeping the 1924 appropriations as low as possible and well within the estimated revenues.

Lower Federal taxes have become a prominent factor in the policies of both Republicans and Democrats, as indicated by competition in the respective tax revision plans. This policy has not yet struck our state, county and municipal officials. Taxpayers can do their part by impressing upon their Aldermen and members of the State Legislature the need for lower taxes in order that business may be stimulated and living costs reduced.

Lower taxes cannot be brought about by wishing. They can only be accomplished by arousing public sentiment and giving the tax creating bodies to understand that voters are in favor of lower taxes. You can do this by talking to your Aldermen and Representatives of the State Legislature, or by sending your views to them in a letter. Politicians have their ears to the ground. They will not act contrary to the interests of their constituents, but it is necessary for you to let them know how you stand. Do not overlook the fact that everybody pays taxes, directly or indirectly, in the form of rent, cost of food and clothing, and other expenses.

A Boost for Robert E. Crowe

STATE'S Attorney Crowe of Chicago has been branded by the Chicago Federation of Labor as "unfriendly to labor." No stronger endorsement of Mr. Crowe's activity in the interest of law and order could be had. When one reviews in a calm, cool, dispassionate way the trail of blood and murder that marks the streets of the Lakeside City and locates the blame, he is not surprised that the gentlemen who conduct these unions have it in for the police and the state prosecutor. Most criminals entertain a similar prejudice against officials sworn to enforce the law.

Postponed Until After Election

SECRETARY of State Hughes does not consider it feasible at present to call another International Conference on further limitation of land and naval armament. Let's wait until the National election is over.

But don't overlook the importance of plenty of aircraft. Ships, guns and armies are becoming obsolete. The next war will be fought from the air with T.N.T., or something more deadly.

Worth More Than Money

CLARENCE SAUNDERS, the Piggly Wiggly man, has filed a petition in bankruptcy. He has lost $3,000,000. But he still has more than he has lost. He has his nerve left.

"I'll have it all back in a year or two," said Mr. Saunders, as he signed the petition.

No whining. No weeping. No attempt to establish an alibi for business errors. But plenty of courage on the part of the man who began as a grocery clerk.

Wrecking the Railroads

AMERICAN railroads are paying something like a million dollars a day in taxes. In 1923, the increase was $85,000 a day over the taxes for 1922. This is another reason why farmers and other shippers cannot get a decrease in freight rates. It also will account for the high cost of financing railroad extensions and added equipment.

Living and Learning

THE House of Representatives in its wisdom has decided that industry must pay all the taxes or (hopefully) as much of them as can be squeezed by a 44 per cent surtax on the higher incomes.

Sounds good. The only trouble is it won't work out.

Moderately well-to-do persons living in $75 flats and those who haven't much worldly goods, unhappily will continue to feel the burden. Their rates have been reduced from 4 to 2 per cent, which is highly satisfactory. The Garner Amendment (Democratic) to the rejected Mellon Tax Plan also is quite satisfactory to the vast army which never can be made to understand that it pays taxes indirectly—and a-plenty—on everything it buys, from sugar to shirts.

President Coolidge and Secretary Mellon, as well as Congressman Madden and other influential members of Congress, have said that surtaxes of 50 per cent must be reduced materially in order to induce the rich to take their money out of tax-exempt bonds. This advice has been discarded, although Mr. Mellon's argument was based on the scientific investigations of the best experts of the Treasury Department. Tax rates, too often, are settled upon a political rather than a scientific or economical basis. The fact that the proposed rates will cause an annual treasury deficit cheerfully is ignored.

"Soaking the rich" always has been a favorite pastime. But, unfortunately, the big stick flies back and hits the soaker in the eye. We live and we learn—sometimes. But it's a costly process.

Supreme Court Guards U.S. Liberties[*]

Proposed Amendment to Federal Constitution Is Germ of Political Revolution—Courts Ruled by Congress

By JAMES A. EMERY
Counsel, National Association of Manufacturers

DURING 134 years of national life under a written Constitution, 3,163 proposals have been offered for its amend- ents were, by circumstances and in point time, regarded as part of the original oposal, for without the assurance of the ceptance of the severe limitations placed on the power of government, the Constitution would not have been adopted. Dur- g the course of our national life, we ve, therefore, strictly speaking, accepted ut nine amendments of the many pro- osed. Four of these have been added ithin the past ten years. More than 100 ere suggested during the last session of ongress and forty have been offered with- the past six weeks, but never until the st session of Congress has an amendment een suggested the effect of which would elieve the legislature of every limitation pon the uncontrolled exercise of govern- ental power. Such is not the ostensible urpose of the proposal, but such is its in- vitable consequence.

The proposal itself is quite simple. It is hat Congress shall have power to re-enact, y a two-thirds vote, any statute declared nconstitutional by the Supreme Court. Within such a simple suggestion is hidden he germ of political revolution.

In our conception, government is but he instrument through which a free people exert authority over themselves, secure he common defense and common interest, nd establish justice. It possesses no power save that which is conferred upon it, and no authority save that which is con- erred upon it, and no authority save with- n the limitations with which its exercise s surrounded.

The dominant creed of those who shaped his state was faith in the moral worth, capacity and dignity of the individual. They saw in the release of his powers, stimulated by opportunity and desire for betterment and guaranteed security in the fruit of effort, the energizing force of personal progress and national development. Organizing their political philosophy into a plan of government, they wrote in wisdom an instrument of restraint. To seventy-nine express grants of power, they attached 115 prohibitions, and to nineteen declarations of legislative authority they fastened seventy denials.

Nor were these limitations the original suggestions of contemporary ingenuity. Every constitutional restraint, every specific prohibition, every check and balance, spoke their fear of unlimited power, their knowledge of human nature and political history. They wrote into the Bill of Rights a thousand years of practical experience with every circumstance of government. They forbade the things that men of their blood had learned from death and persecution, on battlefield and scaffold, by prison and confiscation, destroyed liberty and denied a square deal to the common man. Each inhibition upon the exercise of political power barricaded some avenue through which kings or parliaments, dictators or protectors, executives or lawmakers, masters of the purse or sword, had invaded personal rights. "Every one," said Elihu Root, "stops a way through which the overwhelming power of government has oppressed the individual and may do so again if the way is opened."

Tests of a Free People

They are indeed, but rules which may be repealed or modified, but our realization of their significance is the continuing test of our capacity for self-government. They are practical tests by which we may immediately determine whether we are still the possessors of that necessary self-restraint through which a free people may alone "subject their own conduct to the control of declared principles of action."

But what would have been the value of the reservations of the particular rights of individuals or of the states unless a practical means had been created through which those limitations were to be interpreted and enforced whenever there was evidence of trespass upon them? The judicial power, ultimately expressed in the Supreme Court, was ordained and established to declare in any litigated conflict of right between a citizen and any legislative or executive act, whether such act was repugnant to the permanent will of the people, expressed in their Constitution. If such repugnance existed, it must be evident that the agent was attempting to exercise a power which his principal had not only not granted but had refused.

Mr. LaFollette's proposal is that whenever Congress disagrees with the Supreme Court in the interpretation of its power it shall be the final judge of what that power is. Is not this the end of all written restraint upon political power? For to disregard every express limitation upon the action of the legislature it is but necessary that it shall repeat its original offense. That which was originally done without authority becomes lawful when the trespasser repeats the usurpation. No right of the individual to liberty or the fruit of his effort, property, may thus be retained save on the sufferance of the lawmaking power. Every distinction between the separate authorities of our three departments of government, the crowning glory of political achievement, may be obliterated. Every distinction between local and national government may be destroyed. That which was innocent when done may be a crime by legislation after the fact. Jury trial may be refused; a state religion may be established; free speech and publication abridged or prohibited; the security of persons and premises against unlawful searches and seizures destroyed; any man tried as often as the lawmaking power pleases for the same offence, despite acquittal; bills of attainder passed at pleasure, and private property seized for public use without compensation.

Restrictions on Authority

These are, indeed, but passing illustrations of what would happen to our familiar restrictions upon legislative authority if Mr. LaFollette's proposal were accepted. It represents the very things which have happened in periods of political excitement or passion, but the enforcement of which was frustrated through the protection of the citizen by the judicial enforcement of constitutional limitation.

Literally, if such an amendment were adopted, it would become all there was of the Constitution, for there would be no power, however specifically denied, that Congress could not exercise, even in the face of a unanimous decision to the contrary by the Supreme Court, provided a two-thirds majority of the legislature joined in reasserting the authority which did not constitutionally exist.

So long as such a proposal were a part of the Constitution, no subsequent amendment could limit it and no previous amendment could restrain it. The proud guarantees of the Constitution to the citizen would be subject to the whims and caprices of a Congressional majority, for the judicial power would be impotent, judicial remedy would be at an end, the restraints of a written constitution would have disappeared, and we would have established in lieu of the government which we know the unrestrained control of an omnipotent Congress, requiring only the assent of two-thirds of its members to employ all the powers of government in any direction it pleased and for any purpose it liked.

World Wheat Acreage Cut

The acreage planted to winter wheat in nine countries that last year had 60 per cent of the total winter wheat acreage in the Northern Hemisphere, excluding Russia, is now placed at 65,184,000 acres as compared with 70,796,000 acres last year.

[*] Abstract of address before Farmer-Manufacturer Convention on "The Constitution and the Citizen."

Illinois' Capital Stock Tax Law Held Invalid by Court

The amendment to the Capital Stock Tax Law, passed by the 1923 General Assembly, has been held unconstitutional by the Illinois Supreme Court. This law placed the taxing value of corporation stock of no par value at $100 a share. Roberts & Schafer of Chicago sought an injunction against Secretary of State Emmerson in the Sangamon Circuit Court restraining him from enforcing the law and the Supreme Court has sustained their position.

The General Corporation Act of 1919 that stood prior to 1923, in a previous decision by the Supreme Court, was held not to authorize computation of franchise taxes, including the license tax on foreign corporations, on the basis of $100 a share in case of no par value stock. By an amendatory act the General Assembly in 1923 specifically provided that in computing the tax, no par value stock should be treated as though its par value was $100 per share.

The Supreme Court decision now holds this amendatory act of 1923 to be invalid.

As the law now stands, no par value stock of both Illinois corporations and foreign corporations doing business in Illinois must be treated as though its par value is equal to the amount stated in the corporation's charter to be necessary to fully pay up its stock.

In the opinion of Colin C. H. Fyffe, General Counsel of the Illinois Manufacturers' Association, in the case of corporations whose charters do not state the amount necessary to fully pay up their stock, no par value stock should be treated as though its par value were equal to the amount actually paid in for the stock.

The present decision of the Supreme Court coincides with a number of opinions rendered by Mr. Fyffe, who has advised members of the Association having no par value stock to pay the franchise tax or license tax under protest. If this has been done, recovery can now be had for the excess tax collected by the Secretary of State. The method of collection is through the Illinois Court of Claims.

This amendment to the Corporation Act was the only bill of importance opposed by the Illinois Manufacturers' Association that was passed at the 1923 session of the Illinois General Assembly. It was opposed by the Association on the ground that it was inequitable and would ultimately be held invalid, with resulting confusion and expense connected with the recovery by the taxpayers of the excess tax.

Women Should Give Time Generously to Public, Says Mrs. Mabel G. Reinecke

To verify more than 700,000 individual tax returns was the colossal task Mrs. Mabel G. Reinecke, Chicago's Collector of Internal Revenue, and her staff had to perform in 1923. While employers as a rule filled out the forms correctly, Mrs Reinecke says, there were many who, by bad penmanship, incorrect addresses of employes, or failing to give names in full, made the work much more difficult than it should have been.

"When an employer sends in a form giving the name 'J. Smith'," she said, "you can see that it will be hard to find 'J. Smith's' individual return."

But these minor troubles set rather lightly these days on the head of Mrs. Reinecke in view of the fact that she collected over $40,000,000 more in the thirty counties of Northern Illinois than was collected the year before. Incidentally, this increase showed a marked growth in prosperity.

Moffett Photo

Mrs. Mabel G. Reinecke

Mrs. Reinecke, by the way, is the only woman in America to hold such a position as the one she has. Still girlish in appearance, but always dignified and unruffled, she shows not the slightest nervousness over the responsibility for the vast sums of Government money that pass through her hands. During the last fiscal year, ending June 30, 1923, this young woman collected $197,863,229.25.

Quoting these figures in a recent speech, Mrs. Grace Wilbur Trout, former head of the old Illinois Equal Suffrage Association, jestingly remarked that she was glad "Mabel" did not forget the "twenty-five cents," as it bore testimony to her good training as an accurate compiler of suffrage statistics.

"Mabel" was not the official statistician of the Illinois suffragists, but her clear head and able reasoning early brought her to the attention of the older feminists who were scanning the horizon for attractive and clever young women to help carry on the work. Mabel Gilmore was made a member of the Suffrage Association, and soon came to be known as the "baby of the board."

Her first real job, she says, was in the office of Charles Ringer of the Cook County Board of Review where she studied taxes for all she was worth. She was the first woman to hold such a position, and she says the men used to look at her as if she were some strange wild animal. One of them asked her one day why she was interested in reform measures since she could not vote. She determined that some day she would vote, and she worked harder than ever for suffrage.

Her political activities started when she was in high school and her father, then a member of the old "Merriam for Mayor" group of Progressives, needed a secretary. The fascination of political life got into his daughter's blood and has never gotten out. She believes that women have a distinct gift for the nation, and that they should give generously of their time to the cause of public welfare.

"And that," she adds, "is what I mean by politics."

I. M. A. Staff Man Started War Prisoner Release Move

The campaign that is being waged in the public press at the present time for the release of World War soldiers convicted of crime and serving sentences in Federal penitentiaries, was initiated seven years ago by William Hayhurst, now a member of the staff of the Illinois Manufacturers' Association. At that time—back in 1917—Mr. Hayhurst was living in Springfield, Mass., and was a candidate for the Republican nomination to the Governor's Council (the equivalent of the City Council in Illinois cities). The *Boston Globe*, in its issue of July 20, 1917, published an article headed, "Urges Pardon For Enlisted Fighters," and then sets forth Mr. Hayhurst's campaign platform in which the candidate said:

> "I pledge myself to the proposition that any soldier who is serving with the forces of the United States who has committed an offense and who has paid his fine or served his term should be immediately pardoned and given a clean record."

Mr. Hayhurst was born in England and served in the British merchant marine. He has lived in the United States for many years and is a naturalized citizen. He had six brothers in the British service during the World War and was himself active in Massachusetts as a "Four Minute" man, speaking frequently for the Liberty Loan.

The eleventh annual convention of the National Foreign Trade Council will be held in Boston June 4, 5 and 6, according to an announcement by James A. Farrell, President of the United States Steel Corporation and Chairman of the Council. "Our need for Wider Export Markets," will be the central theme of the conference, Mr. Farrell said.

Exact Inventory a Prime Necessity

Fundamental In Determination of Operating Profits and Net Worth—Must Conform to All Federal Regulations

I.

By WALTER M. LE CLEAR

Ernest Reckitt & Co., Chicago
and
President, Illinois Society of Certified Public Accountants

THE subject which I have been called upon to address you today is one so broad in its scope as to preclude it from an exhaustive treatment in the ort time allotted me. Inasmuch as my dience is composed largely, if not en-ely, of representatives of manufacturing terprises, I will undertake to limit my lk to those phases of the inventory ques-on that are of particular moment to the anufacturer.

Purpose of Accurate Inventory:

There are numerous reasons, as you all now, why accurate inventories are of rime importance to the manufacturer, ut from an income tax standpoint we are undamentally interested in their accuracy or the purpose of determining operating rofits and net worth. I will, therefore, ot attempt to discuss any of the numerous ther phases at this time.

Discussion of Determination of Operating Profits:

Every business enterprise is, of course, operated with the intention and expectation f making a profit. That's what makes it business enterprise. When profits cease, or if profits fail altogether to materialize, hat enterprise usually dies a quite sudden death; but the business that regularly shows a credit balance in the Profit and Loss Account is naturally destined to attain a ripe old age. Too often a manufacturing business that, early in life, bears every indication of proving a success, is doomed to failure by reason of an improper estimate of the operating costs, and, next to net sales, operating costs constitute the most important item in the determination of operating profits.

Factors Same as in Costs:

And the same factors that enter into operating costs are present in the manufacturers' inventories. There are the raw material and the labor, and there is the overhead; all of these enter into the manufacturing costs; and all of these combine to determine the value of an inventory.

Methods Must Conform with Bureau Standards:

In the present day, and in fact during the last six or eight years, the valuation of inventories is not and has not been a matter of so simple and arbitrary procedure as was formerly wont to be the case. Since the inception of the comparatively higher income tax rates on Jan. 1, 1917, the methods employed in the valuation of inventories have necessarily conformed more and more closely with rules and regulation prescribed by the Bureau of Internal Revenue of the United States Treasury Department. It is my purpose to discuss today the application of the Treasury Department's regulations to the manufacturers' inventories.

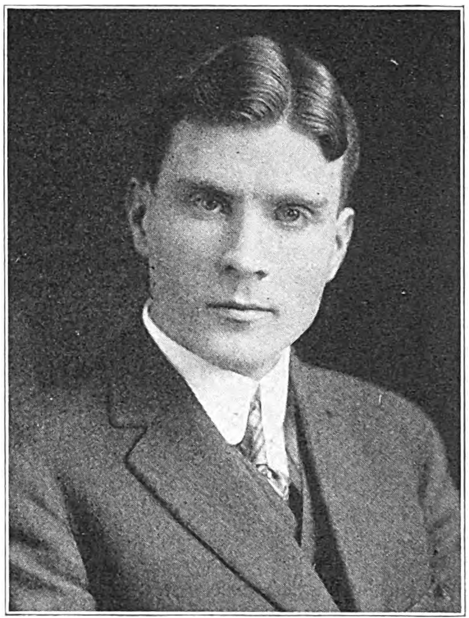

Photo by Wallinger
Walter M. Le Clear

Two Fundamental Bases Established by Treasury Department:

The Treasury Department, by a Treasury Decision rendered in December, 1917, has established two fundamental methods as bases upon which to value inventories. These two bases are, first, cost, and second, cost or market, whichever is lower. The taxpayer who has faithfully and consistently used either one of these two bases has no need to worry about additional back taxes, as far as his inventories are concerned. It is not to be understood from this, however, that the Treasury Department will accept no other basis, but if a basis other than these is used, its acceptance will be accomplished only after special consideration by the Commissioner.

Above Bases not Exclusive:

It is possible, for instance, that an inventory consistently valued at market, even though higher than cost, may be acceptable in certain lines as is done now by dealers in securities, but to date the Bureau has rendered no published ruling or decision countenancing this method in any other line. More will be said about this method later.

Definition of Cost:

Cost is defined by the Regulations to mean the actual amount expended for material or product on hand with the following exception:

In any industry in which the usual rules for computation of cost of production are inapplicable, costs may be approximated upon such basis as may be reasonable and in conformity with established trade practice in the particular industry.

Definition of Market:

"Market," under ordinary circumstances and for normal goods in an inventory, is defined by the Regulations to mean the current bid price prevailing at the date of the inventory for the particular merchandise in the volume in which usually purchased by the taxpayer. Where no open market exists or where quotations are nominal, due to stagnant market conditions, the taxpayer must use such evidence of a fair market price at the date or dates nearest the inventory as may be available, such as specific purchases or sales by the taxpayer or others in reasonable volume, and made in good faith, or compensation paid for cancellation of contracts or purchase commitments. If, however, the merchandise has been offered by the taxpayer at prices lower than the current price, the inventory may be valued at such prices less proper allowance for selling expense.

Goods not Identified with Invoices:

If, by chance, some of your goods have become so intermingled that you are unable to match it up with the invoices with any degree of certainty, then the following rule applies: The goods whose cost cannot be identified will be deemed to be either

> (a) the goods most recently purchased or produced, during the period in which the quantity of goods in the inventory has been acquired, or
>
> (b) if you maintain book inventories in accordance with a sound accounting system in which the respective inventory accounts are charged with the actual cost of the goods purchased or produced and credited with the value of goods used, transferred or sold, calculated upon the basis of the actual cost of the goods acquired during the taxable year, including the inventory at the beginning of the year, the net value as shown by such inventory accounts will be deemed to be the cost of the goods on hand.

The matter of valuing goods in the inventory which are unsalable at normal prices or unsalable in the normal way because of damage, imperfections, shopwear, changes of styles, odd or broken lots, or other similar causes, including second-hand goods taken in exchange, is specifically covered in the Regulations, which provide that such goods should be valued at bona fide selling prices less cost of selling, regardless of whether "cost" or "cost or market" is used on the remainder

---

(*First Installment of Address Before 4th Tax Congress, Illinois Manufacturers' Costs Association.)

of the inventory; very similar to the retail merchandise method of inventory.

Damaged Goods, etc.:

If such goods consist of raw materials or partly finished goods held for use or consumption, they should be valued upon a reasonable basis, taking into consideration the usability and the condition of the goods, but in no case should the value assigned be less than the scrap value. Bona fide selling price is defined to mean actual offerings of goods during a period ending not later than thirty days after the inventory date. The burden of proof will rest on the taxpayer to show that such exceptional goods as are valued upon such selling basis come within the classifications which I have indicated, and he must maintain such records of the disposition of the damaged goods as will enable the Revenue Agent to verify the inventory as valued by the taxpayer.

Change of Basis:

Under the 1918 Regulations, a taxpayer was permitted to use either the "cost" or "cost or market" method for the closing inventory of the year 1918, regardless of his previous practice, and if a change of basis was involved he could make this change without first obtaining permission from the Commissioner of Internal Revenue. Later on, a Treasury Decision repeated this privilege for the closing inventory of the taxable year 1920, but aside from these two exceptions, a taxpayer must adhere to the method he has adopted, and can make a change only after first obtaining the Commissioner's sanction. A change will not be permitted if the principal reason for seeking permission to change is to reduce the tax liability. Unfortunately, that is usually the reason.

Provisions of Revenue Act:

The Revenue Act states that (*Section 203*):

> "Inventories shall be taken upon such basis as the Commissioner, with the approval of the Secretary, may prescribe as conforming as nearly as may be to the best accounting practice in the trade or business and as most clearly reflecting the income."

Special emphasis is to be placed upon these two requirements prescribed by Congress itself, and embodied in the Revenue Act, namely, first, that the method used must conform as nearly as may be to the best accounting practice in the trade or business, and, second, it must clearly reflect the income.

Regulations Add Factor of "Consistency":

The Regulations, however, appear to go one step ahead of the Act itself, and make the further stipulation that,

> "The inventory practice of a taxpayer should be consistent from year to year, and greater weight is to be given to consistency than to any particular method of inventorying or basis of valuation, so long as the method or basis used is substantially in accord with these regulations."

Methods Not Countenanced by Regulations:

After scanning the Regulations that have been promulgated and undertaking to digest the rulings that have been published, one is quite apt to come to the conclusion, however, that it is a far simpler matter to set up a list of methods that are not in accord with the Regulations than it is to arrive at a safe summarization of the acceptable methods. The Regulations themselves frankly point out that "among others" the following methods are sometimes used, that are not in accord with the Regulations:

> (a) Deducting from the inventory a reserve for price changes, or an estimated depreciation in the value thereof.
>
> (b) Taking work in process, or other parts of the inventory, at a nominal price or at less than its proper value.
>
> (c) Omitting portions of the stock on hand.
>
> (d) Using a constant price or nominal value for a so-called normal quantity of materials or goods in stock.
>
> (e) Including stock in transit, either shipped to or from the taxpayer, the title of which is not vested in the taxpayer.

Reserve for Price Changes:

In connection with the first of these prohibited methods, namely, that in which a deduction is made for a reserve for price changes, or for an estimated depreciation in the value of the inventory, I am going to take the liberty of referring to an instance along this line which has come to my attention within the last few days.

Depreciation of Inventories:

I have in mind a case which went to the Committee on Appeals and Review—the highest income tax tribunal in the Treasury Department, aside from the Commissioner himself. This was not a manufacturing concern, but it nevertheless indicates the trend of acceptability in the minds of the Department officials. This was the case of a wholesale jeweler, who took his inventories at what he considered "cost or market, whichever is lower."

Example of Depreciation, as Construed by Committee on Appeals and Review:

After arriving at his total inventory on this basis, he then deducted a certain percentage off the total inventoried value of his watches and another percentage, slightly higher than the first, off the balance of his inventory. The total of the two resulting balances gave him what he considered his total inventory. His purpose in making these deductions was to provide for what experience has shown it will require for repairing and cleaning up his merchandise to put it into salable form after its exposure on shelves.

As you all know, in a wholesale jewelry institution, they will accumulate numerous watches that either become damaged in their own stock, or the other retail customers have acquired and returned to them on account of broken condition, or some other fault; and the intent was to place an average percentage on the watches, and on other commodities in the inventory, to take care of what he considered would be a reasonable cost in replacing that merchandise in the condition in which new merchandise would be.

This particular wholesaler had used the same method, and exactly the same percentages, since long before the excess profits taxes and the high normal taxes were conceived, so that he was well fortified with the one factor that the Bureau has stated is to be given more weight than any other thing, namely, consistency. He has done that for a great many years. It was not an effort to evade the high tax rates of 1917 and subsequent years. As a matter of fact, he had established it back in 1905.

Furthermore, my observation as a public accountant has been that this method is common among wholesale jewelers, with considerable variation, however, in the percentages that are used by one wholesaler from those used by another, and yet the Committee on Appeals and Review rejected this taxpayer's inventories, and reversed the entries by which the jeweler had made his customary inventory reductions. This taxpayer, upon advice of counsel, was very careful in his correspondence and dealings with the Bureau to avoid the use of any words or phrases that could be construed to indicate plain depreciation, but nevertheless the Examiner, the Income Tax Unit and the Committee, all took the view that it was simply a depreciation of the inventories, and to that extent the method used by the taxpayer was rejected. I point this out to show how persistent and determined the Bureau is in rejecting any inventory method that is contrary to the standards which the Bureau has fixed.

In that particular instance, I believe that had the wholesale jeweler taken each particular item and valued it on the basis of its selling price in the condition in which it existed, taking into consideration his gross profit ordinarily received from that type of merchandise, and had he kept an accurate record, he would have been all right in that case. But unfortunately, he did not have such a record.

Lord Kelvin Gold Medal Awarded to Prof. Thomson

Prof. Elihu Thomson, one of the founders of the General Electric Company, and an eminent electrical engineer, has been awarded the Lord Kelvin gold medal and will go to England during the coming Summer to receive it on July 11. The award was made by the British and American Engineering Societies, acting jointly. It is awarded every three years as a mark of distinction and for excellence in original research work in engineering. Prof. Thomson is the first American to receive this honor.

Prof. Thomson has been granted about 700 patents in the United States. His inventions in dynamo, electric machinery, electric welding, watt-hour meters, lightning arrestors and magnetic arc extinguishers are fundamental. He was a pioneer in arc lighting, and innumerable electrical devices have been improved through his work.

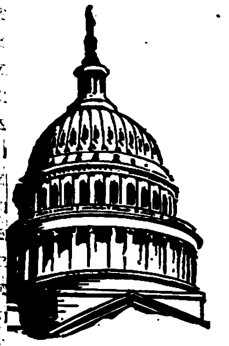
Having always been interested in education, he is now, and has been for many years, connected with the Managing Corporation of the Massachusetts Institute of Technology, and was the Acting President of the Institute from 1920 to 1922 inclusive.

Muckraking Rampant in Washington

Republican Leadership Wrecked by Wave of Hysteria; Common Sense of General Public Put to Severe Test

By JOHN M. TOWNSEND

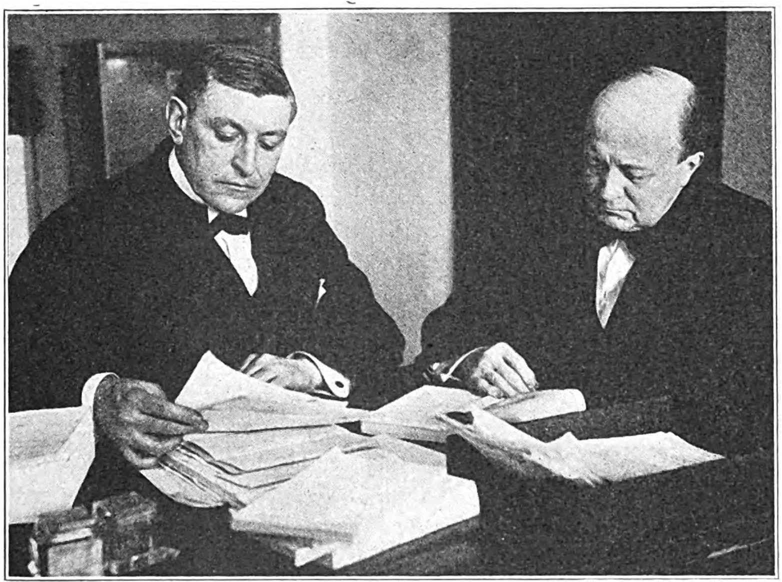
Washington Correspondent, Manufacturers News



Washington, D. C., Feb. 27.—Students in mob psychology will find much to interest them in Washington at this time. For the moment, waves of hysteria and political demagogy are ating against President Coolidge, who is anding like a rock of Gibraltar in their ay. The common sense of the country being tested right now, and the question gitating Washington is: Will the country and with the President for justice and a quare deal, or will it follow the muckkers bent on destroying faith in the Govnment and its officers, without even a trial?

MUCKRAKING RAMPNT—The atmosphere in Washington today is very similar to that which followed the Declaration of War by the United States upon Germany. At that time, thousands of well-intentioned persons "unoaded" on the Government heir "suspicions" concerning he loyalty of many of their neighbors, and oftentimes of heir friends. At that time, he Government was so busy getting into the war that investigation of these rumors, suspicions and innuendoes had to be temporarily postponed, so that by the time the investigations were begun, many of the charges fell of their own weight. Today, Washington is the catch-all for every conveivable form of charge, rumor and innuendo affecting the honesty and integrity of Government officials—the rostrum from which these charges, for the most part unsupported by evidence, are being blazened to the whole world. Three times within the week, members of Congress have personally attacked fellow-members in debate with the avowed purpose of impugning their motives and ruining their reputations. To date, no outstanding voice has been raised in Congress in protest against the vilest exhibition of low-browism ever manifested in an American Congress. On the contrary, there seems to be a political panic among the Republican members, in the Senate particularly, which invites rather than hinders the presentation of old charges dressed in new clothes and of new charges unsupported by evidence. Against this wave of hysteria and demagogy, President Coolidge is standing firm, backed by John T. Adams, Chairman of the Republican National Committee, who has taken sides with the President against the political trimmers in Congress, and by Attorney-General Harry M. Daugherty, who is meeting the assaults directed against himself with a demand for justice and fair play.

SOME FALLEN IDOLS—Leadership on the Republican side of the Senate was never so paltry and naked as in this crisis. Senator Henry Cabot Lodge, after protesting against the demand for the resignation of Edwin Denby, was among the first to stultify himself by rushing off to the White House to demand the resignation of Daugherty, and this only on the unsupported charges of Senator Wheeler, of Montana, and before Daugherty had been heard. No wonder Senator Caraway, of Arkansas, took Senator Lodge to task for objecting to the "lynching" of Denby and his own attempt to "lynch" Daugherty. Even Senator Pepper, of Pennsylvania, ordinarily an upstanding, two-fisted fighting Republican, joined with Lodge in the Daugherty episode, but, suffering a qualm of conscience, wrote Daugherty a note telling him what he had done. In pure legal ability it is probable that Senator Pepper enjoys a higher repute among lawyers than Mr. Daugherty; but in politics, Mr. Daugherty easily outshines Senator Pepper. Sensing the political phase of the attacks upon him, Daugherty not only raked Senator Pepper fore and aft for his political cowardice, but on the legal basis of truth and justice tore him literally to pieces for failing to grant him, Daugherty, a chance to face his accusers in open court. When outstanding Republican leaders in the Senate, like Lodge and Pepper, succumb to a wave of mob violence such as Washington is now inflicted with, it is manifest that, morally and politically, Republican leadership in the Senate has reached its lowest ebb. It has remained for President Coolidge to insist that evidence be submitted to him which would apply in more normal conditions to action by a President in demanding the resignation of one of his Cabinet, and for Chairman John T. Adams, of the National Committee, to become the Republican spokesmen in demanding an end to "political terrorism" and opposition to attacks on the integrity not only of public officials but of the Government itself. Probably the Republican morale in the Senate is too weak to recover completely from the weakness it has displayed thus far, or to prevent the passage of all kinds of investigating resolutions, but it is the firm opinion of the leaders outside of Congress that there must come a reaction sooner or later to the wild-eyed attacks on men and issues now being made in Congress, not by members of the Committee charged with the oil investigation, but by others who, enjoying Senatorial immunity, are giving free rein to their views for political purposes only.



Underwood & Underwood

GOVERNMENT COUNSEL IN OIL LEASE PROSECUTION
Owen D. Roberts, Prominent Philadelphia Attorney, and Atlee Pomerene, Former U. S. Senator from Ohio, Appointed by President Coolidge and Confirmed by the Senate

CONGRESSIONAL IMMUNITY—Under the Constitution and laws of the United States, members of Congress cannot be brought to a bar of justice for anything they may say in debate on the floor of either house of Congress. The recent outbursts have been of such a character as to raise the question whether or not this immunity, while originally well-intentioned, is not really working out in an un-American way. It is noteworthy that members who make charges against high officials on the floor of the House and Senate never repeat those charges on the public platform, although frequently invited to do so. This immunity provision protecting Congressmen was inherited from the English law and the English law was originally passed merely to protect members in Parliament from being jailed or beheaded by tyrannical kings. It was not intended as a protection for the members of Parliament against their fellow citizens. While there is no disposition on the part of any one to limit the right of free speech in Congress, there is widespread complaint in Washington that that right should not be abused by the voicing of unsupported charges against anybody, which is too often accompanied by a failure on the part of those who voice them to confront those whom they accuse.

TAX LEGISLATION FIASCO—As anticipated, the Democrats, supported by the so-called Progressive Republicans in the House, have overridden the Mellon Tax Reduction Plan and placed the Democratic substitute, the Garner Bill, on the high road to passage by that body. In the House, however, the Republicans are still laboring manfully to get up a Republican substitute measure with a maximum surtax of 37½ to 40 per cent, and a reduction in normal taxes of 50 per cent, to take its place. There are indications that this substitute has won over a few of the Progressives, so that the final vote in the House may be exceedingly close. As it now stands, it is the belief of Government officials that the Democratic bill will not produce enough revenue to meet the Government's expenditures after the tax reductions are made. Furthermore, the Democrats have again refused to vote for the future taxation of securities now tax-exempt, thereby making it certain that those of large incomes will continue to invest their surplus money in such securities, instead of in creative securities, and they have otherwise muddled up the measure until nobody knows at this time just where the Bill stands as a revenue measure. Inasmuch as the House, which formerly favored a 32 per cent maximum surtax, now favors a 44 per cent surtax, it is difficult to see how the Senate, which formerly favored a 50 per cent surtax can do much for the taxpayer. In well informed quarters here, it is regarded as practically certain that President Coolidge could not sign the House Bill as it now stands, and it remains to be seen what the Senate can do to improve it so as to avoid a presidential veto. In Congressional quarters, the opinion exists that President Coolidge might sign a bill with a surtax around 35 per cent, but there is an almost universal opinion among Republicans that any measure carrying a surtax such as is contained in the House Bill cannot escape a veto. Voting in the House on the tax bill has been partisan for the most part, and oftentimes illogical on the part of the "floating" members, who do not know exactly what they do want. Alice Roosevelt Longworth is being quoted as having summed up the situation of the Republicans in the House by saying, "The Republicans are like a pack of fleas who have lost their dog."

CHICAGO WATERWAY SITUATION—Chicago's sanitary situation has been brought to a sudden head by a motion of the Department of Justice to advance the hearings on an injunction suit to prevent the Sanitary District from using more than 4,167 cubic feet of water per second from Lake Michigan for sanitary purposes. The Sanitary District is now using up to 10,000 feet, and the present suit is being supported by all the Lake states, which complain that the withdrawal of this amount of water is lowering lake levels, and it is also being supported by Canada. In the meantime, several different bills have been introduced in Congress on this subject representing all forms of conflicting opinion, both in Chicago and down the state. Heretofore, efforts to compose these differences have failed. The situation is now critical, the Department of Justice having been forced to act because of the demands of Canada and the interested states, and it remains to be seen whether the Illinois delegation in Congress can compose its differences and enact a law in time to be of any use to Chicago.

"Accurate Costs" Is Theme Discussed by Costs Assn.

F. W. Hansen, Auditor for the Weller Manufacturing Company, Chicago, was the speaker at the evening meeting of the Illinois Manufacturers' Costs Association held at the Hotel LaSalle last Thursday evening, Feb. 28. His subject was "The Proper Segregation and Distribution of Labor and Expense for Accurate Costs." The talk was illustrated with printed charts and forms, and a copy distributed to each member in advance. Mr. Hansen has had considerable experience in cost accounting development.

Prove the *difference* in Gasoline

THERE is one sure way for you to prove to your own satisfaction that Red Crown is surpassingly different from other brands of gasoline.

Try it in your own cars and trucks. Compare this record with the mileage you are getting from the gasoline you now use. Then you will have indisputable evidence that Red Crown gives "more miles per gallon."

You will realize why we are positive of these results when you consider the thousands of truck owners, many of them operators of large fleets, who use Red Crown exclusively. Most of these fleet owners keep records of their operating costs. They find that

RED CROWN
GASOLINE

gives them "more miles per gallon" and that they have less engine trouble due to oil dilution and carbon.

Also there is the verdict of the thousands and thousands of motorists who use Red Crown. These people daily find that Red Crown gives them the easy start, quick pick-up and mileage they expect and demand.

These advantages and the satisfaction which they bring are yours once you switch to Red Crown Gasoline.

You will find that there is no other gasoline quite like Red Crown in performance. Made for the one purpose of producing *power* in internal combustion engines, every drop is utilized for that purpose. There is a Red Crown pump just around the corner. If you will have your tanks filled with Red Crown, you will be a Red Crown user from then on.

Spend Five Profitable Minutes

Five minutes spent in reading this book, "What Is Good Gasoline?" will repay you many times. It explains the "six essentials of good gasoline" and why the lack of even one of these may increase your hauling costs materially. It will be sent to you free, on request.

Accidents a Heavy Toll on Industry

Total Time Lost in 1923 Aggregated 227,000,000 Days; 96 Per Cent of All Small Injuries Develop Infections

HIS is the fourth of a series of articles written for MANUFACTURERS NEWS Capt. Fisher on Industrial First Aid.— litor's Note.

THE question of the proper care of wounds, particularly the small kind, is one of the problems of industry. I emphasize the small wounds since it these which cause 96 per cent of all inction, and I need hardly give the reason, r we are all guilty—more or less. These e the wounds seven people out of ten glect, and it is due to this fact that inction is so common. Put it down, if not good poetry, at least as good gospel: "A wound infected, *was* a wound negcted."

Many industrial concerns penalize their nployes who do not at once "down tools" hen they suffer the slightest wound, and port to the First Aid man or nurse; and is is a just rule, not only because it is a me saver, but because it is also one of e most humane of rules.

The time lost to industry last year from cidents totaled 227,000,000 days. It ould be mighty interesting if we could it know what percentage of this time was ie to minor injuries. It is true that a od deal of infection is due, not so much neglect, as to the fact that too many conrns are grossly negligent in regard to ie First Aid supplies kept on hand, and articularly because there is no properly ained person in the shop who knows ow to administer first aid. Here are a w of the causes for infection from the bove neglect:

Old iodine, which is always dangerous, nd the use of this, that and the other proprietary remedy—their names are legion. alves kept in open boxes, out of which is usually the fingers that "dig the stuff" smear on the wound—a very filthy and angerous habit, to put it mildly. The peristent use of undiluted peroxide, etc., etc.

I am ashamed to confess that I have ound such conditions in many of the most eputable concerns; it is doubtless due to houghtlessness, but that is never an excuse. he head of a smelting company actually old me, in the blandest manner, that he idn't think there was any particular need or concern, that the insurance company hich carried his compensation insurance vould take care of any trouble that might rise. If that is a common conception of hat compensation insurance, among other hings, is for, then it is time such companies lid a little more thorough inspection work, specially in connection with the precribed First Aid Cabinet, which is supposed to not only be KEPT, but KEPT UP!

I am not so sure but that the onus lies entirely with the insurance companies, and it is time some positive work was done to remedy this too prevalent condition. It is peculiarly to the credit of the Illinois Manufacturers' Mutual Casualty Association, that C. T. Jaycox, the General Manager, has organized a Safety, Accident Prevention and First Aid Department for this very purpose, which has already accomlished much to overcome these conditions. This work is threefold, namely, popular talks to the employes of their policy-holders on safety accident prevention and first aid; private instructions to selected employes, and, of course, installation of a new First Aid Cabinet or the restocking of the old with the proper requisites; and, lastly, follow-up work with the concerns thus reached. On this important matter, the I. M. M. C. A. is pioneering in the very line of action which the writer has long believed to be the logical method of attacking industrial accidents—i. e., from the insurance viewpoint.

Caring for Wounds

Permit me now to suggest some methods of caring for wounds. Of course, let it be understood that these hints are to be followed only in the absence of a surgeon, and only first aid at that. The question is frequently asked, "Why is it that small wounds—i. e., cuts, scratches, slivers, etc., cause more infection than the more serious kinds?" There are two main reasons—small wounds seldom bleed, and most of us neglect them, while with the serious wound there is usually much bleeding and we always insist on medical aid. Notice this—the class of wounds which cause the most trouble do not bleed much, while those from which there is the least infection bleed freely. Here is the secret—the running of blood is nature's method of keeping out the pus germs. So, then, always permit a wound to bleed and expose it to the air and sun; it is only severed arteries which must be immediately controlled, as we showed in Article 2 of this series.

There are three points to keep in mind when treating wounds:

1—Never touch a wound with the bare fingers, no matter how clean the hands; medically speaking there is no such thing as clean hands. If a sliver or foreign body is to be removed, first sterilize the points of the tweezers or needle by thrusting into a lighted gas jet, or even the clear flame of a lighted match. Don't try to remove deep-seated foreign bodies—that's the doctor's job.

In squeezing a wound or replacing torn skin, use gauze so as to protect the wound from the fingers; do the same even when squeezing a pimple.

2—Never wash a wound with ordinary water, it should be boiled first; but, as that is not always possible, we suggest the use of strained gasoline, which is both non-irritating and antiseptic.

3—Never use an ordinary cloth on a wound, because no cloth can be safe, short of a medically prepared antiseptic dressing. But, here again, we suggest a way out —take a suitable piece of muslin which has been washed, and scorch with a hot iron, or hold before a hot surface; this destroys the bacteria and renders it antiseptic. Remember that all dressings applied to wounds should be devoid of any application, such as iodine or salve; the clean dressing is for protection to the wound and that alone.

Regarding the best applications for wounds (and by that I mean those drugs which are supposed to kill the germs) keep the wound clean so nature will have a chance to heal the hurt. These we call germicides, and until medical science discovers something better than iodine, hold to its use, notwithstanding the fact that there are all kinds of proprietary drugs offered which are said to be "Just as Good" or "Better."

Characteristics of Iodine

There are some vital facts about iodine which I trust you will carefully note. Iodine which has deteriorated, through lack of being properly corked, or which has been exposed to sunlight, or which is old, is

The coal keeps disappearing—

What is it accomplishing?

MANY manufacturers have found that keeping accurate records of the cost of generating steam is an open door to greater opportunity—an opportunity to stabilize profits by replacing the vague part of manufacturing costs with accurate data.

They are beginning to keep a record, or insist that a record is kept, of the *cost of steam generation*. And they are carrying this a step farther; they insist that each department of the plant be charged with its correct share of that cost.

With this new opportunity has come increased appreciation of Republic Flow Meters. The records of this equipment are both a guide and a check. They are the main entry in computing the cost per thousand pounds of steam; they are the unerring guide to correct firing so that the cost will be held to the minimum. They show where the disappearing coal *goes!*

Ask for your copy of the new booklet: "Power Plant Cost Accounting."

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can — that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

All Size Trucks for Rent

positively dangerous. Deterioration can easily be detected—it is always dark brown or black. Infection actually may be caused by the use of such a drug.

Again, never wet the dressing with iodine and apply wet to the wound; neither apply the dressing over iodine which has been swabbed on the wound and has not dried on the skin. From these practices serious trouble has been experienced. Further, never pour iodine into a large wound, that is really barbarous; in such cases, merely paint to the edges and around the wound—one or two inches outwards.

The important point I wish to impress is that iodine should not be more than 4 per cent, whereas the strength commonly sold is 10 to 13 per cent. Then, too, don't keep more on hand than can be used within two weeks. It will be wise to resort to the use of "B & B" swabs or "Iodabs," as these are provided with 3½ and 4 per cent strength. They keep indefinitely and are, therefore, always safe.

There is a germicide on the market which is becoming popular and has been used by some of our largest industrial corporations for over a year, with excellent success. It seems to possess all the good features of iodine, with none of its drawbacks. For instance, it will destroy bacteria without destroying the tissue, it prevents the forming of scabs, and the dressings will not stick to the wound. It is stronger than phenol and much stronger than iodine; and yet it will not burn. It is known as "G. S. I. COMPOUND." Don't use peroxide of hydrogen clear on wounds; when so used it drives the germs in, slows up the process of healing and, if used repeatedly on the same wound, may produce a yellow discoloration known as peroxide poisoning. Neither throw it away, if there is any on hand, but simply keep it well corked, out of the direct sunlight, and use for the following:

To wet the first plugs thrust up the nostrils to stop severe nose bleed.

To gargle the throat for tonsilitis.

To swab infected tonsils, especially if there are white specks on them, and to spray nose and throat if infantile paralysis is epidemic.

Some workmen have an unfortunate habit to which has been traced numerous cases of infection. It is this—applying of salve dressing at home to a wound which has been treated at the shop with iodine. The possible explanation is that usually the ointment applied was "Carbolo-Salve," and usually from a box container. Now, the facts are these containers are very dangerous, because most folks will use their fingers instead of a clean knife, etc., to dig it out, and therein lies all the trouble. Indeed, many diseases have been actually traced to a box of salve used by every Tom, Dick and Harry—to say nothing of the Susies, Marys and Janes. If there is such a container of salve, either at the works or in the home, burn it at once! If salve must be kept for general use, buy it in tubes, and get "Unguentine," which is especially good for burns and is also a clean, safe salve, especially when kept in collapsible tubes.

For abdominal wounds, care for the victim in the following manner until the surgeon arrives:

If the wound is horizontal—i. e., across the abdomen—place patient on the back with head and shoulders slightly raised and flex his knees, keeping them up with some support. If the wound is perpendicular—i. e., up and down—keep the legs out straight. In both cases apply the antiseptic, or scorched, dressing to the wound dry. If in either case the intestines are showing, always flex the knees and keep a dressing on which has been wrung out of hot salt water. The air must not be allowed to come in contact with the exposed bowel.

Use of Adhesive Tape

In the use of adhesive tape, never apply directly to wound; never fasten to bare skin, as the perspiration will cause it to come off; always secure it over the bandage. In applying tape to a finger, the wrist or the limbs, don't put it on too tight as it may cause strangulation; this may be easily detected by the deep purplish hue of the skin and the swelling; remove at once, stroke the swollen part towards the body and re-attach tape a bit looser.

The signs of infection are redness, heat, swelling, pain and the loss of functioning of parts affected.

Restlessness, Discontent, Cause Industrial Accidents

Restlessness and discontent on the part of many factory workmen are responsible for an increasing number of industrial accidents, according to W. S. Duncan, in an address at the annual meeting of the Rockford Inter-Insurers Exchange, Rockford, Ill. Mr. Duncan is Chief Inspector of the Illinois Manufacturers' Mutual Casualty Association, Inc.

"The number of industrial accident cases is mounting year by year," said Mr. Duncan. "All insurance statistics show a heavy increase during the past two or three years. This may be accounted for in part by the movement of large bodies of men of small mechanical ability or sense into the factories and mechanical trades. It is my belief that a considerable part is caused by restlessness.

"The people of this country, in fact all Northern peoples, have for centuries been restless, constructively restless, with the ambition to go to new places, to develop new resources, to carve better homes out of the far places, to do better and greater things. The amazing development of this country from a wilderness to a land of settled communities has been brought about by restless men, reaching out to improve their condition, with a willingness to work ceaselessly to accomplish their ends.

"What have we now? Among a large section of our people there is a destructive restlessness, the restlessness of discontent, discontent with working hours, discontent with working conditions, discontent at having to work at all. There seems to be abroad among us an all-pervading craving

(Continued on page 15)

Efficiency As Applied to Cost Work

Two Major Methods of Accounting—Job and Standard Production; Should Spread Burden Over Entire Output

I

THE subject, "Efficiency Methods as Applied to Cost Accounting," brings in that old word "efficiency" that makes most of us afraid to get up on our eet when a crowd of business men is resent. You know the word has gathered onsiderable opprobrium.

There are many different ideas as to what fficiency means. The efficiency expert, in ome minds, is the chap with big tortoise-hell glasses who works forty hours and astes reams of paper (that is forty hours f paper work), to get out a 5-cent lead encil. Some think efficiency is a system hat can be bought and sold like a blanket. The ideas are both erroneous.

Let us come down to fundamentals,—what is the meaning of the word "efficiency?" It comes from the Latin word *efficio*, which means *I do triumphantly, completely* or *fully*. That has considerable meaning, if you are a Latin student; but from a business standpoint, it means "I do as completely or as fully as possible." You engineers know the meaning of efficiency n engineering fields. You talk about the efficiency of steam, or coal, and this or that mechanical device, meaning the work turned out for the effort expended.

Taking this for a ground work we will apply efficiency to cost accounting and you will recognize the outline I intend to follow. Efficiency is getting the greatest results, the maximum results, for a minimum expenditure of effort; and, efficiency as applied to cost accounting means just that.

What are costs? All of us have some conception, thought or idea of what costs are, which ranges all the way from the total amount of money expended to a lot of infinite details as to what we spent for this or that. Costs may be reduced to this —what we spend for materials, expense and labor. Expense is a major item that will differ or vary according to the business.

Engineer an Analyst

"Cost accountant" seems to me a rather poor term. A "cost engineer" is something different, especially from the manufacturing standpoint. The engineer is an analyst; he is constantly searching effects for causes. The effects are all right, they show up in the cost accountant's summary of expenses. We have the effect of its costing so much money, but what makes it cost so much money? That is what the manufacturer is interested in, that is what the cost accountant or cost engineer is supposed to develop. Executives know the effect and they may know the cause of the effect, but what they want to know is how to remedy the cause, or what causes the cause.

By H. B. STONE

Industrial Engineer,
Evens & Howard Fire Brick Co.,
St. Louis, Mo.

THE following article, the first of two installments, is an abstract of an address delivered by Mr. Stone before the Southern Division of the Illinois Manufacturers' Costs Association at St. Louis.

There are two major ways of arriving at costs, depending, of course, on the industry—job costs and standard product costs. These are the two ways and the man that takes job costs and applies them to the cost of standard product may be able to get an idea of what his business is doing, but he isn't getting the greatest return for the least expenditure of effort.

What do we mean by job costs? When we are selling or manufacturing an article that is more or less intermittent in our particular plant—when each individual job or contract is dissimilar from another—then we should apply the job costs system. Consider the printing game; that is fairly illustrative because all of us use forms that have to be printed and each form that you put up to the printer is an individual form —an individual job. You show him what you want and he makes it, and he knows how much to charge for it from job costs and he knows how much to charge you for the form on a re-order or for a similar type of form that someone else orders.

A manufacturer who is producing a standard line of products year in and year out is not interested in the cost of each lot produced, because he doesn't sell each lot as an order and it doesn't make any difference in his marketing conditions whether this particular lot costs 50 cents more or less than the previous lot. He sells them at a standardized price on a standardized market because he is manufacturing a standardized product, and he can obtain cost which will be of considerably more value to him with less expenditure of effort than the job cost man can, although there are cost methods which will strike both.

Job Costs as Example

I suppose most of you are interested from the viewpoint of executives in the analysis of costs—the idea of being able to see what the costs reveal. Job costs are particularly interesting because they vary with different jobs. Using printing for an example, we take into consideration the cost of printing, trimming, binding, etc. We have one job that is costly or difficult and another that is simple and cheap. We can't lay down a hard and fast rule that will apply to every job. We make an average price and we lose a lot of good business because we say our costs are high, merely fooling ourselves on the particular item of cost. We have other business that we get a great deal of—based on this average cost and we get work which we figure at too low a cost.

I think all of us have had experience with this in a small item industry, or in the manufacture of a small item. It is a sort of a little branch of the game which has been fairly profitable as a whole, but the item hasn't been given much attention. Then that branch has grown until it became one of our major products. When it became one of our major products we suddenly realized we were not making any money for the reason that we were figuring on inadequate costs.

We all have seasonal difficulties with labor, materials or something else in our particular business and you all know what the excess costs are when you have a change in labor. You know what the costs are when you have to throw extra men in to handle material because of conditions which have made it difficult. We don't think we are justified in charging the particular job in process when we have an extra gang on. We don't think that those jobs should bear the extra burden. When difficulties like that arise the burden is spread over the entire product.

That brings us to the basis of the value of costs to the executive. Those of you who are executives and have had reports of costs put up to you, have seen that an item of expense shows for this month a cost, say of $32.90; last month maybe it cost $32.60 and next month it may cost $29.80. After you look these over you begin to wonder what it means. Do they mean anything at all? Perhaps you study those cost records and say, "Costs are going up; this month cost more than last month; must be on account of inefficiency in the operating department." Next month they go down, and you figure that the operating department is getting very efficient. That leaves you in a pretty poor position to do much executive work.

If the costs are broken up on the basis of efficiencies of costs, it is different. Harrington Emerson used to say that he didn't care anything about the dollars and cents of costs if he knew the efficiency of them. I believe if an executive can study the efficiency of his costs he can control his plant. He knows exactly where it should be regulated. I believe in breaking down standard costs for the plant executive to

(Continued on page 15)

TRANSPORTATION

Class I Railroads of U. S. Show Increased Net Income in 1923; Short of "Fair Return" Set by Congress

FINAL figures of net railway earnings of Class I railroads for 1923, as compiled by the Bureau of Railway Economics, aggregated $977,543,590, or 5.10 per cent of their tentative valuation. This compares with the net operating income of $776,880,592 in 1922, equivalent to a return of 4.14 per cent. Class I roads operate 235,667 miles of track in the United States.

The railroads earned the largest return they have yet secured under the Transportation Act of 1920 during the last year, although they were short $125,026,442 of the fair rate of return of 5¾ per cent provided for under the Transportation Act.

The operating revenues of the Class I carriers in 1923, according to the complete reports for the year, amounted to $6,356,883,424, an increase of $736,481,703, or 13.1 per cent over the year 1922. The total operating expenses amounted to $4,944,011,124, an increase of $483,388,653, or 10.9 per cent.

Freight revenue totaled $4,624,890,900, an increase of 15.3 per cent over that for 1922, but because of the lower freight rates, this increase in freight revenue was less than the increase of 21.7 per cent in ton miles handled. Passenger revenues for the year totaled $1,147,751,691, an increase of 6.6 per cent. The increase in passenger miles was 7 per cent.

Reports showed that the Class I carriers in 1923 paid $336,399,600 in both state and Federal taxes. This means that the Class I railroads, for taxes alone during the past year, paid out daily an average of nearly $922,000. Compared with 1922, taxes increased $30,920,083, or nearly $85,000 per day.

Ford's Road Makes Money

Preliminary statistics indicate that the Detroit, Toledo & Ironton Railroad had a net operating income for 1923 of $1,786,924, as compared with a 1920 deficit of $2,121,524, fulfilling the prediction made by Henry Ford when he bought the road July 10, 1920, that though it had been operated at a deficit, it could be made a net income earner in 1923.

The gross income increased from $4,481,036 in 1920 to $10,417,412 in 1923, which was $1,412,938 greater than in 1922. Operating cost was reduced $737,170 over the previous year and the cost of maintenance of equipment dropped $691,243.

The railroad, which Mr. Ford purchased for about $5,000,000, has about 400 miles of main line and 166 miles of yards and sidings with trackage rights over fifty miles more.

Order Sale of K. C., M. & O. Ry.

The Kansas City, Mexico & Orient Railroad will be sold to the "best and highest" bidder from the steps of the courthouse at Wichita, Kas., on March 27, according to announcement by Ben F. McLean, special master, authorized to prepare the sale of the road to satisfy a Government lien. Bids will be received for portions of the road and its various holdings, and others for the entire system. The terms of the sale provide that in case the Court refuses to confirm the sale, in whole or in part, the property for which the sale is not confirmed shall be resold at a later date, to be fixed by the special master with approval of the Court. The terms further provide that the purchaser must keep the road in operation. Sale of the road was ordered recently in the Federal Court at Kansas City.

H. R. Matheuson Goes to Buffalo

H. R. Mathewson, for three years Assistant General Agent in Chicago for the Canadian Pacific and also the Soo line, has been appointed General Agent of rail and steamship lines of the Canadian Pacific at Buffalo. He will also represent in Buffalo the Soo and the Duluth, South Shore & Atlantic.

Predict Big Traffic in 1924

Railway executives are interested in a report from Kansas City to the effect that the shippers who recently met there to advise with the railroads, estimated that traffic for the first half of 1924 would be 15 per cent in excess of that of 1923. When it is considered that the 1923 traffic was the greatest in the history of the railroads, a 15 per cent increase is worth some consideration, it was pointed out. This announcement coming after the prediction by a similar body in the Middle Atlantic states that there would be an increase of 10 per cent, indicates that the recent predictions of high traffic in 1924 are being justified.

Reverses Decree on C. P. & St. L.

By order of the Supreme Court of Illinois, the Chicago, Peoria & St. Louis Railroad must be sold in its entirety and not in parcels, as was provided in the decree entered by the Sangamon County Circuit Court at Springfield. The decision of the lower court was reversed and remanded with directions. The Sangamon County Circuit Court had ordered the road sold in twenty parcels.

More Miles of Road Than Autos

Indo-China offers an exceptional market for automotive products because it lacks railroad facilities, while having over 5,000 miles of paved roads. These conditions, with the increasing road mileage, are rapidly popularizing the automobile, both passenger and commercial, says the State Department. American cars are popular because they are more powerful than European makes, and American accessories are also looked upon with favor. Approximately 60 per cent of all cars and accessories in use are American. The 1923 registrations up to the end of August were 3,922 automobiles, 350 motor trucks, and 360 motorcycles.

Public Owns Railroads

According to the Interstate Commerce Commission, there are 777,132 holders of the stock of Class I railroads. The par value of the outstanding railroad stock held by these 777,132 owners is $7,242,191,000. On a basis of $100 par value, the average holdings of each owner are less than 100 shares—93.2 shares, to be exact. These figures take no account of the million or more railroad bondholders whose interest in the financial success of the carriers is equally as great as that of the stockholders.

Watering Places, Resorts, Along Illinois Central Line

The Passenger Department of the Illinois Central Railroad has issued an attractive booklet, in colors, telling of the watering places and resorts that can be reached along that line. There are many quiet resorts, most of them adjacent to mineral springs of established therapeutic value, along the Illinois Central, and several of them have golf courses and scenic surroundings of marked beauty. The places described are Dixon Springs and Creal Springs, Illinois, Dawson Springs, Cerulean Springs, Grayson Springs, White Mills and Hardin Springs, Kentucky; Allison's Wells, Cooper's Well and Brown's Wells, Mississippi, and Hammond and Covington, Louisiana.

stlessness, Discontent, Cause Industrial Accidents

(*Continued from page 12*)

amusement, amusement furnished by ieone else, and at a price.

"There is in some quarters a lack of de in workmanship. We have drifted ay from the idea that a good mechanic a most excellent and necessary citizen. rtain highbrows, with half-baked theories of economics and of life in general, who have abilities to write and talk, p this pot boiling."

Mr. Duncan told how the safety idea s useful in counteracting this spirit of tlessness among factory employes which s causing so many accidents and what Illinois Manufacturers' Mutual Caslty Association, Inc., is doing in an ornized way to train factory employes how guard themselves against accidents.

Explains Tax Filing Extension

U. S. Treasury officials fear some consion may result from the recent anuncement that corporations would be anted an extension of time from March to June 15 for the filing of corporation come reports. Commissioner Blair of e Bureau of Internal Revenue advises at the time extension was granted under e condition that tentative returns must filed with the proper Collector of Inrnal Revenue on or before March 15, companied by at least one-quarter of the estimated amount of tax due, together with a statement setting forth the reason why the return cannot be completed within the prescribed time, and a formal request for the extension. Tentative returns should be indicated as such.

Regarding the possible reduction in taxes, as proposed in the bills pending in Congress, Commissioner Blair advises all taxpayers to make their income tax payments as usual. Any refunds authorized by Congress will be made by the Collector's office to which the tax was paid, and if the installment plan of payment has been adopted by the taxpayer, he will be informed of the amounts he may deduct.

Lloyd's to Build New Home

Lloyd's, the famous marine and general insurance corporation, has decided to remove from the Royal Exchange, London, where its headquarters have been for 149 years, and build itself a new home at an estimated cost of $6,000,000. The Company has secured an acre of land in the heart of the business section of London, and the razing of the old buildings on the site preparatory to the erection of the new structure is expected to begin soon.

Lloyd's had its origin in a small coffee house about 1688. Started by Edward Lloyd, the business grew so rapidly that in 1692 its owners were obliged to seek larger premises. Before the end of the 18th century it had become the acknowledged center of the world's marine insurance, a position which it since has held.

Efficiency As Applied to Work of Cost Accountant

(*Continued from page 13*)

where he can study his efficiency of costs—that's all they are good for—executive control.

Lower Production Costs More

When costs go up for the month, maybe it is caused by inefficiency of operation and maybe the operating department worked at a much higher efficiency on what it had to produce than it did the month previous. Use as an illustration a plant practically shut down—say to two-thirds of its capacity. Direct labor should be no more and materials should be no more. But when you get into the expense item, regardless of the efficiency, the expense will be greater. Take yourself, for instance, you are probably an item of expense on your plant—I don't mean useless expense, but you are an item of expense. It costs so much a month for you to be there and if you cut that plant down to two-thirds of its output (they can't divide you to two-thirds as they do its output), then you are going to cost more per unit.

If an executive has his costs distributed so that he can put them against standard costs; can even pick out the item that is costing in excess or less, then he is in a position to control them. If the product is costing more on account of inefficient management, then it brings it down to the simple question of whether he will continue in that way.

FOREIGN TRADE

Economical Packing for Export Saves Much in Freight Charges—Ocean Rates Are Based on Rectangular Scale

THE question of packing with regard to economy in ocean and inland freight charges must be given serious consideration by every exporter," ys J. F. Keeley, Assistant Chief, Trans- rtation Division, U. S. Department of mmerce. "These factors often determine e feasibility of entering the world's mar- ts. Some exporters build containers at cost a great deal more than is neces- ry for the protection given to their ship- ents.

"While the necessity of careful packing nnot be too strongly emphasized, it is nquestionably a great waste to build rge, heavy cases or crates that add ma- rially to inland and ocean freight costs hen the product can be carried just as fely in a container that uses half as uch lumber, time and expense. For ex- mple, a Middle-West exporter, whose ses had been improperly constructed of ery heavy lumber, was able by adopting roper construction methods not only to reduce the weight of his cases and cut down freight costs but also to provide a better container.

"Ocean rates are usually based on the cubic measurement of a package and its ability to stow in the smallest space. In calculating these charges, shippers and steamship companies frequently disagree as to the cubic measurements of packages. Sometimes the difference is the result of careless measurement by the shipper, but usually the dispute arises because of the fact that steamship companies, as a rule, measure all packages on a rectangular scale, so that all irregularly shaped packages are estimated by their greatest dimensions. The reason for this is that irregular packages are not easily stowed; it is difficult to find smaller packages to fill in the vacant space, and dunnage or ship's lumber has to be used to keep the cargo from shifting."

Exports Playing Cards to Orient

The United States nearly doubled its exports of playing cards during 1923, both in quantity and value, this item amounting to $1,121,986. Of this more than one half was absorbed by the Far East and sales to England totaled $121,647. British South Africa ranked third with shipments reaching in value to slightly more than $50,000.

Toledo a "Co-operative Office"

The Toledo Chamber of Commerce has been designated a "Co-operative Office" of the Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce. Leonard J. Gans, Foreign Trade Secretary of the Toledo Chamber of Commerce and a graduate of the Georgetown School of Foreign Service, is in charge of the office. According to the Chamber of Commerce, Toledo's foreign trade comprises at least seventy-five major classifications of manufactured articles and extends to practically every civilized country in the world. Products are exported to more than fifty-five foreign countries, and a heavy import trade is done with twenty-five countries.

Canada's Trade Balance

Official figures issued by the Dominion Bureau of Statistics place Canada's favorable trade balance for 1923 at $124,789,608. Total trade during the year amounted to $1,918,264,789, compared with $1,646,771,892 in 1922. This was an increase of $271,492,897, or 16.5 per cent. Imports of goods and commodities reached a value of $903,530,515, a gain of $141,121,206, and exports of Canadian products were valued at $1,014,734,274, an increase of $130,371,691.

European Automotive Exports

Europe is still doing busines in automotive products, even if the trade isn't what it used to be, according to the Department of Commerce. Even Germany is able to do some manufacturing and exporting of automobiles in the midst of all her difficulties. During the first eight months of 1923, Germany exported 3,387 passenger cars and chassis and 1,066 motor trucks and chassis. France went much farther, exporting 17,081 passenger cars, valued at 508,147,000 francs, and 1,576 trucks, valued at 49,380,000 francs. Great Britain shipped 1,420 passenger cars, valued at 568,814 pounds, 536 commercial vehicles, and 1,160 chassis for motor cars.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

ALGERIA—9265, electric accessories, automotive; lamps, electric automobile.

AUSTRALIA—9226, canned goods, including tomato paste, asparagus, pork and beans, oysters, crabs, lobsters, and shrimps; 9213, printing machines for manufacturing from reel of paper, printing, numbering, and perforating various duplicate and triplicate books; 9231, pyroxylin sheets, in neutral and tint.

AUSTRIA—9244, fats, animal and vegetable oils, animal and vegetable.

BELGIUM—9211, radio apparatus; radio parts.

BULGARIA—9255, engines, small type, 15-18 horsepower, using kerosene oil; lead pencil-making machinery; tractors, caterpillar type, complete with plows.

CANADA—9230, brick kilns, oil-burning equipment for up-draft cased and daubed; machinery for removing stones and roots from wet clay without drying, grinding, or sieving.

CHILE—9257, oxygen-making machinery; welding outfits.

COLOMBIA—9278, furniture and filing cases and metal fittings and parts.

CUBA—9214, lard, pure steam.

DANZIG—9258, corn; fat; lard; paraffin; soda, caustic; tallow.

ENGLAND—9247, alfalfa meal for poultry; 9271, cellulose scrap; cellulose acetate; 9247, fish meal for hogs; meat meal for poultry; 9271, nitro cellulose.

FRANCE—9242, gasoline; 9222, hams; 9242, kerosene; 9222, lard; salted meat.

GERMANY—9276, cereals; cotton; flour; 9207, gasoline; mineral oils; 9283, motion picture films, all kinds; 9276, sugar; 9203, tires, automobile cord, 1,000.

GREECE—9275, gypsum for making clay tiles.

INDIA—9285, angles; beams; drills; engines; iron plates, galvanized, corrugated, and plain; lathes; 9277, mill stores; 9285, planes; 9277, paper; 9285, power hammers; steel bars.

IRELAND—9264, automobiles to sell at $1,100 to $1,800; 9220, agricultural machinery, all kinds; 9221, coffin boards, red or white oak and southern yellow pine (sawn timber); 9252, galvanized slating nails and chisel points; 9256, mills, grist or corn, 50 horsepower and up; 9252, nails, wire, sheeting nails with galvanized washers.

MESOPOTAMIA—9239, clocks; jewelry; novelties; watches.

MEXICO—9248, electrical appliances, especially household specialties; 9249, engines, marine, 10-16 horsepower, low speed, gasoline or distillate.

NORWAY—9224, coffee; cottonseed oil; fruits, fresh and dried; nut margarine; oleomargarine; rice; sirup; sugar.

SCOTLAND—9261, carpet cleaners; vacuum cleaners.

SPAIN—9273, bags, new and used, cotton and jute; 9246, jute, yarn, and textile manufacturing machinery.

SWITZERLAND—9272, cotton yarn for weaving and making hosiery; 9288, grain.

SALES MANAGEMENT

"Printed Salesmanship" Is Greatest Medium to Extend Market; Must Be Distinctive, Exclusive, Highest Quality

By NORMAN M. SWEET
Sales-Service Manager,
Manz Engraving Company

THIS is the second and final installment of a series of two articles by Mr. Sweet, written especially for MANUFACTURERS NEWS, on the subject of "Successful Leadership."

II

EACH little piece of "Printed Salesmanship," is powerful. Powerful, because they hit the mark. They go straight to the point, they are intelligent, there's no compromise, they make sales. They prepare the way to sales for the salesman who "follows-through"; they go where salesmen cannot go; they get full attention, at once. The quality must be good; the lay-out clear and the sales copy intelligent, to get 100 per cent sales consideration. There is no greater sales producing force in the world, when these three sales factors are combined in your sales literature. No, not even flesh and blood salesmen.

Now, you begin to understand that the quickest, surest and most profitable method of getting efficient and economical distribution is through "Printed Salesmanship." Place just one-fourth of the money you have spent haphazardly for general publicity in the past into direct advertising-selling and you will get your returns over and over again. You have got to do this. You cannot afford to hire hundreds of salesmen. You can afford to buy hundreds of thousands of printed salesmen. Put your salesmen (you are keeping only the best now) behind these printed salesmen and your selling will be invincible.

One word of caution. Buy only the best printed salesman, just as you employ only the best grade of human salesmen. Be sure your printed salesmen are properly equipped. Get them of the highest quality; help them carry their message; dress them up. A good appearance is of first consideration in anything. Make them successful leaders of the business they represent. Do not cut corners and cheapen their appearance. Get them up in the style that will command attention and create interest, excite desire and whip-up action. All four of these essentials, which are the proven psychological factors of successful advertising-selling, may be summed up in one word—CONFIDENCE.

Your "Printed Salesmanship" may be a label, a booklet, a folder, a catalog, a circular, a broadside, an illustrated letter, a dealer sign, a merchandise display cut-out, a house organ, or a combination of several or all of these. Find out just what combination will help you sell your customer and then help your customer sell his customer, and your advertising-selling work is fundamentally accomplished.

Then, your next step is to keep pace with these conditions. Do not rest on your laurels.

Too much complacency in business makes the great need for leadership now. "Up and doing" is the slogan of the hour. "Printed Salesmanship" is the greatest medium you can use to extend your market. Organized business and competition make it your greatest and most economical sales producer.

You may advertise in all the great newspapers and magazines in the world, but you cannot afford to spend your money "hoping" that you will get your potential buyers with *one* insertion of your advertising. You cannot afford to spend thousands of dollars repeating your sales message in all sorts of publications. You cannot say your complete "Sales-Say" in a small advertising space. You will have to spread out your sales message over a number of monthly advertisements. Besides, there are your competitors, ten or twelve, right with you screaming their messages. You will have to do something else to get results. That something else is "Printed Salesmanship." You have to link it up with your publication advertising, and then successful selling will begin.

Today, your advertising should be selective. Analyze the publication thoroughly. Find out what market it covers, and then, wake up to the exclusive, all powerful medium of "Printed Salesmanship" which enables you to say your complete "Sales-Say" and make the advertising spent in your publications do "full duty."

Your "Printed Salesmanship" must be individual in order to be exclusive; therefore, you should select the highest quality of sales literature to hold your buyer's eye. Keep on sending this literature to him with a different message of the highest quality each month. It's the follow-up that gets results. Your successful competitor is doing this and is reaping the big harvest, and Market Management today demands keeping in close touch, not only to keep your regular customers, but to bring back your inactive customers and go after prospective ones.

Successful leadership depends upon reaching the greatest number of buyers with the highest quality of "Printed Salesmanship" showing the quality of the product you sell and the service you are placing behind each sale to help your customer in turn re-sell.

Men are leaders because they see what's right to do, and do it. They do not wait to be told. They are criticised for not asking permission of So-and-So. But they go ahead. They succeed. Then they are acclaimed all-powerful. It has been so since the world began.

You must assume responsibilities today. You have got to go right after the thing you believe in and put all of your conviction behind your beliefs. The man who hesitates will make room for the man of action. There's no room for men of fear.

You must originate your own sales literature. You cannot "copy" what your competitor has done and get results. Your customer loses "faith" in you. He knows you are lazy, you do not think, you are a parasite, you are a follower. The man who creates "Printed Salesmanship" need have no fear that the "follower" will hurt him.

Go out into the selling field today and see if this is not so. The man who has the "ideas" wins. He must work out the correct application, and when he does the customer knows "who" did it and "how" he did it. The man who copies the worker loses the buyer's confidence. A very simple illustration of "what causes failures."

Successful leadership in this "Age of Distribution" calls loudly for men who will have the courage of their convictions and ACT. "Printed Salesmanship" is the most efficient and economical means at hand. Use it. Your returns will be in profitable results beyond your wildest expectations.

The proof of this:

Go into any reliable printing establishment which has a permanent "Sales-Service" Department. Talk to the Sales-Service Manager. Ask him to show you how to get better, cheaper and quicker "repeat-sales." Give him the same confidence you would give your national advertising agency principals. Don't see how cheap you can buy printing. See how well you can procure "Printed Salesmanship." Think of the "result" first. The price will be right if the result's good. Now's the e to put "Printed Salesmanship" to the :. Do it along these lines and success- sales leadership will be yours.

ngle Stage Centrifugal Fire Pump Now on Market

Centrifugal pumps have been used for e protection for some time and there are ır sizes covered by Underwriters' speci- ations which are ordinarily sold, having pacities of 500 GPM, 750 GPM, 1,000 M, and 1,500 GPM respectively, against 0 pounds pressure. These fire pumps re first of the multistage type to run at a eed of 1,150 RPM. Later the specifica- ns were modified so that multistage pumps running at 1,800 RPM could be furnished, and the last change in the specifications now permits the use of single stage pumps.

The Allis-Chalmers Company has built for some years a special high head type of single stage pump which has been used satisfactorily for heads as high as 300 feet. By making a few changes in the details of this pump, the Company is now able to build them in accordance with the Underwriters' specifications and having characteristics acceptable to the Underwriters, furnishing single stage Underwriter fire pumps in accordance with the Underwriters' specifications. This is a step in advance, as there is now available for Underwriter fire pumps the simplest type of equipment possible, absolutely reliable, giving adequate protection and at the same time the cost is less than the multistage type.

Huge Output of Lubricants

The 1923 output of lubricants was 1,097,368,222 gallons, an increase of 12.12 per cent over 1922 production. Imports during the year were 1,219,133 gallons. The new supply was 1,098,587,355 gallons, which exceeded by about 7,000,000 gallons the total demand of 1,091,537,072 gallons, including exports of 351,599,047 gallons and domestic demand of 739,938,025 gallons.

WORLD'S GREATEST AUTOMOBILE MUTUAL

AUTOMOBILE—AVIATION

Export of Automobiles and Trucks from U. S. and Canada in 1923 Sets New High Record, Says Federal Report

THE year 1923 has established a new record in the exportation of passenger cars and trucks from the United States and Canada. with a combined total number of 221,816 and a value of $139,849,020. according to the Automotive Division of the Department of Commerce. The increase in these figures over those for 1922 amounted to 105,625 in number and $58,374,203 in value. Even the previous high record year of 1920 was surpassed by a margin of 27,160 cars and trucks, although a lower unit price reduced the total valuation.

From the United States alone, the exports of passenger cars and trucks in 1923 amounted to 151,896, with a value of $106,010,330. These compare with exports of 78,234 in 1922. valued at $59,320,524; and of 171,644 in 1920. valued at $212,031,702.

Comparative figures which show clearly the growing importance of the export market to the automotive industry are as follows:

> The exports of cars and trucks from the United States in 1923 increased 94 per cent over the 1922 in number. and 79 per cent in value. Adding the exports from Canada, the total increase in number was 90 per cent and the increase in value was 70 per cent over 1922.
>
> In comparison with the record year of 1920, the United States shipped 12 per cent less cars and trucks in 1923, and their value decreased 50 per cent from the 1920 figures. Adding the shipments from Canada, however. the 1923 figure as to number increased 14 per cent. although the total value was still 39 per cent below that of 1920.
>
> The unit value of combined cars and trucks exported from the United States has steadily decreased, as shown by the following figures: 1920, $1.235; 1922. $758; 1923, $698.

Based upon a total production of 4,012,856 passenger cars and trucks for the United States and Canada in 1923, the proportion of machines exported was 5.5 per cent. Adding, however, the foreign assemblies of one American manufacturer. which are not contained in the official statistics but are reported privately, the proportion of exports to production was approximately 8.2 per cent.

The proportion of passenger cars to trucks exported in 1923 was 5 to 1. In 1922, the ratio was 6 to 1.

April was the leading month last year for passenger cars, with 13,352 exported; and in trucks the month of July led, with exports of 3,105.

Practically four out of five trucks shipped from the United States during 1923 had a capacity of one ton or less. Approximately half the passenger cars exported were valued at less than $800. The best national customers for American passenger cars were Australia, Canada, United Kingdom, Mexico, and Sweden, in the order named. During 1922, the five leading markets were Australia, Canada, Mexico, Belgium, and the United Kingdom. Shipments to the five countries cited amounted last year to approximately 45 per cent of out total exports of passenger cars.

More notable changes occurred in the comparative standing of motor truck markets during 1923. Last year, the five leading national customers were Japan, Belgium, Australia, Sweden, and Canada, in the order named, as compared with Belgium, Canada. Australia, Japan, and Mexico in 1922. The change in the position of Japan was due to the large demand for trucks which followed the earthquake disaster early in September, and which continued strong until the end of the year. Figures show that the average unit value has fallen from $739 in 1922 to $616 in 1923.

Standard to Sell "Ethyl Fluid"

The Standard Oil Company of New Jersey and General Motors Corporation are negotiating a contract under which the former will act as distributor in the Eastern part of the United States for the new product developed by the General Motors Research Corporation at Dayton, Ohio. This is an "anti-knock" mixture known as "ethyl fluid," which will be offered motorists in connection with the sale of gasoline. As soon as necessary arrangements can be made, the Standard Oil Company of New Jersey will carry "ethyl fluid" at its own filling stations and will also supply it to other petroleum marketing companies, who, at the option of the purchaser, will add ethyl fluid in the correct proportion to gasoline supplied. Ethylized gas is now being marketed in Chicago, Cincinnati, Pittsburgh and other places in the Middle West. Gasoline with "ethyl fluid" added sells for 3 cents a gallon above current gasoline prices.

No Cut in Auto Prices in 1924

"Prices of automobiles are not likely to go lower this year," declares A. R. Erskine, President of the Studebaker Corporation. "The tendency, rather, is upward, but I believe that prices on the whole will remain at the present level. During the last ten years, labor costs per car have been cut in half, but wages have more than doubled. Man hours per car produced during 1923 were 329, against 600 in 1913. Average annual wages per employe (excluding executive and office workers but including many boys and common laborers at 50 cents an hour) are more than double those of ten years ago. Average worker's wage last year was $1,728. In 1913 it was $760."

Moskovics with Franklin Co.

At a recent meeting of the Board of Directors, F. E. Moskovics was elected a Vice-President of the Franklin Automobile Company. For the past ten years. Mr. Moskovics has been Vice-President of the Nordyke & Marmon Company, Indianapolis. His entire business experience has been identified with the automobile industry in the engineering, manufacturing and merchandising branches. He assumed his duties at once.

Big Auto Makers Get the Business

A. B. C. Hardy, President of Olds Motor Works, says that during the twelve months ending June 30, 1923, seventeen large manufacturers sold 94 per cent of all automobiles, while the remaining 6 per cent of the cars were produced by eighty-four makers. During the six months following that period the seventeen large makers increased their sales to 95 per cent of the total, which caused the eighty-four other companies to lose 25 per cent of the business being done by them. This, according to Mr. Hardy, proves that competition is very keen and only the largest makers can give better values. Mr. Hardy pointed to the new policy of selling Oldsmobile parts throughout the country at one standard published price, without addition of shipping charges or war tax, as a fine example of the desire of the large companies to serve owners to the best of their ability.

Steel for Ford Cars

The Ford Motor Company will require close to 2,000,000 tons of steel in 1924 In 1923 the Company used between 1,300,000 and 1,600,000 tons. Reports that the Ford Company would manufacture all of its own steel are not generally credited. Work has been started on the construction of a steel mill at River Rouge for the Ford Company, but this will produce only a small percentage of the steel required.

S. Experts Will Study Alaska Navy Oil Reserve

. mid-winter start in the examination of Navy's largest petroleum reserve is be- made by the Interior Department in ding geologists and engineers of the logical Survey to Arctic Alaska. The a to be examined is somewhat larger n the State of Maine, covering some 35,- square miles, but it is a practically un- rted wilderness that includes rugged untain chains and vast silent stretches undra. The reserve is an irregular tract t extends for nearly 300 miles along coast of the Arctic Ocean, with Point rrow as its Northern point, and runs and in places for more than 200 miles. The expedition must be entirely self- taining for about six months, requiring freighting of supplies, mainly by dog d, for 400 miles, even before the re- ve is reached—supplies weighing be- een four and five tons and including od, instruments, and even canoes.

The technical members of the party are ilip S. Smith, geologist, in charge; J. B. rtie and William T. Foran, geologists; rald Fitzgerald and R. K. Lynt, topo- aphic engineers, and several assistants.

"Industrial Sweden" A New Book

"Industrial Sweden" is the title of a pre- ntious book published on the occasion of e Gothenburg Tercentenary Exhibition the General Export Association of veden, copies of which are now being distributed by the Royal Consulate of Sweden in Chicago. "Industrial Sweden," as the name indicates, is a work containing a description of manufacturing in that country, and its object is to assist in disseminating knowledge about Swedish concerns and Swedish products. It is well illustrated and contains several maps of more than ordinary interest.

Martin Bolt Director of Mines

Martin Bolt of Springfield has been appointed Director of the Department of Mines and Minerals by Governor Small of Illinois. Mr. Bolt succeeds Robert M. Medill, resigned. Mr. Bolt has been Assistant Director of the Department. A. D. Lewis of Springfield, a brother of John L. Lewis, International President of the United Mine Workers of America, becomes Assistant Director.

Cunard Subsidiary Starts India-U. S. Freight Service

Beginning with the sailing of the "Malakuta" from Calcutta on Feb. 20, a new direct freight service was established from Calcutta and Colombo to Boston and New York, under the Brocklebank Line, a subsidiary of the Cunard Line. Brocklebank Line steamers have been sailing from East and West Coast ports of England and Scotland to Indian ports for the past fifty years, and the Cunard Line plans to make the new freight service between India and the United States the foremost service between the two countries. For the present the new line will carry freight Westbound only, sailing direct from Calcutta and Colombo to Boston and New York.

The firm of Graham & Co., will be agents of the Brocklebank ships in India, while the Cunard Line will handle the vessels in the United States and Canada.

As soon as business warrants, ships will sail direct from the United States to India as well as from India to the United States. The new freight service will be run on a set schedule and will be one of the fastest between this country and Asiatic ports.

Italian Labor Situation Better

The Italian Commissioner of Immigration is receiving reports, especially from Northern and Central Italy, that the number of emigrant laborers is diminishing rapidly, says the Commerce Department. Heretofore, large numbers of applications have been received by the local emigration authorities for jobs on the Continent, particularly in France and Belgium, but in many instances local wages are now more attractive than those offered abroad excluding, of course, the American Continent.

Hardwood Institute Convention

The second annual convention of the Hardwood Manufacturers Institute will be held at the Seelbach Hotel, Louisville, Ky., May 8 and 9, according to an announcement by J. M. Pritchard, Secretary-Manager, with offices in Chicago.

BUSINESS AND FINANCE

*"History and Origin of Investments"—Various Ways of Investing Capital; Interest and Dividends Discussed

II

By EUGENE M. STEVENS

Vice-President, Illinois Merchants Trust Company, Chicago

ACCUMULATED capital may also be used in the enterprise in which the owner himself is engaged in the management, and this of course is the basis of much of our commerce and industry. It is the combination of his money plus his brains and endeavor, which is the basis of the income of many small business men. Unfortunately, the average man's intelligence is not even equal to a proper judgment of the business which he knows most about, and only a small percentage of these enterprises may be called successes. Most of them, at best, only make a fair living and the percentage of failures is very high. If the average man is unable to judge of his own business successfully, why should he be so foolish as to speculate in other business of which he knows nothing?

Accumulated capital may be used in acquiring shares of ownership in established and stable great corporations of long history and high standing and with capable management, and the preferred stock of some of these corporations, which have preference in assets and earnings over the common stocks, are in some instances, no doubt, good investments. However, the principle of all holdings of stock is an ownership in the property, which is junior to all the operating expenses and debts of the property and, therefore, subject most of all to any vicissitudes which may come to the business.

Capital may be invested in loans to such great and established corporations, preferably secured by a mortgage on their property, and if wisely chosen this is one of the safest forms of investment, for the holders of such certificates or bonds, as they are called, has a first claim on the assets and earnings of the property, rather than a last claim, as in the stock ownership. Above and beyond this are obligations of governments and municipalities, supported by the taxing power and, therefore, a direct charge on all the people, which are probably the safest form of investment of all.

It should be borne in mind that there is a distinction between interest as received on loans and mortgages, and dividends received on stocks. Interest is, by agreement, a fixed amount which the borrower pays as a rental for the money which is loaned to him. Dividends on stock, on the other hand, represent the proportion of the earnings of the enterprise. As I have stated before, therefore, interest on loans is a direct charge against the corporation, which must be paid, otherwise the corporation is insolvent; and dividends on the stock are not, in any sense, a charge against the property and are only payable out of net earnings after interest and expenses have been paid and when the management of the corporation, in their discretion, decide that such earnings may be paid out to the stockholders. The payment of such dividends, therefore, depends upon the fluctuations of the business and its successful operation, from year to year.

Photo by Sweet

Eugene M. Stevens

I recently read an interesting article emphasizing the power and also the limitations of the earnings of the dollar, in which the writer points out the fallacy of sending your dollar out into the world and expecting it to do miraculous things, rather than the safe way of expecting from it its normal and fair earning capacity. Just as only one man in tens of thousands proves his ability to rise above the average to exceptional heights of achievement, so it is only the very exceptional dollar that can perform the same miracle, and the chances are thousands to one against its doing so.

(*To be continued.*)

(*Copyrighted 1924, The Investment Bankers' Association of America.)

Federal Reserve Earnings

Earnings of the Federal Reserve Banks during 1923 reflected an increase of $218,000 over 1922, and the expenses of the twelve institutions showed an advance of $212,000 as compared with the previous year, according to the reports of the Federal Reserve Board.

Total earnings of the Reserve Banks for 1923 amounted to $50,709,000, as against $50,491,000 in 1922 and the total expenses were $29,771,000, as compared with $29,559,000 the previous year. Salaries paid to clerical employes, however, showed a reduction for the year of $196,000, or from $14,222,000 to $14,026,000.

National Enameling Finances

National Enameling & Stamping Company for the year ending Dec. 31, 1923, reports net income of $1,271,295 after fixed charges, equal after preferred dividends to $3.66 a share on its $15,591,800 common stock, compared with net income of $1,982,595 or $8.22 a share in 1922. After the payment of preferred dividends there was a deficit of $286,254 contrasted with a surplus of $1,048,718 in the preceding year. The $1 quarterly common dividend of the Company was passed by the Directors. The regular 7 per cent preferred dividend for 1924, payable quarterly, was declared.

Quaker Oats Makes "Present"

The Quaker Oats Company has announced a "present" of $1,856,250 to its stockholders. The Directors declared a special cash dividend of 16½ per cent on the $11,250,000 common stock and also the regularly quarterly dividend of 3 per cent, both payable April 15 to stock of record April 1. The Company's annual report for 1923 shows net profits of $4,992,004, equivalent after preferred dividends to $29.41 a share on the common stock. Reserves were increased $791,063, this increase being equivalent to an additional $7.03 a share. In 1922 the company drew on its reserves to the extent of $581,160.

Interstate Iron & Steel Report

The annual report of the Interstate Iron & Steel Company for 1923 shows net profits of $351,060, after interest charges and after deducting $395,686 for depreciation and $27,000 for Federal taxes. This is equivalent to $17.03 a share on the $2,060,200 preferred stock.

oney Spending Mania Grips Farmers; Bankruptcy Impending, Says Newspaper

GRICULTURAL interests of the country have for some time been proclaim- the serious financial situation in which find themselves today, and consider- effort has been made through various ncies to give relief to the wheat farmer the troubles of the Northwest, where k after bank has gone to the wall.

llinois has generally been considered mpt from this situation, but *The Car- ge Republican,* in an editorial entitled, ie Price That Is Paid," makes the start- statement that one-third of the farm- in Hancock County are practically ikrupt. In its issue of Feb. 20, that vspaper says, in part:

> Hancock County is more fortunate than any he State as to the number of farms that are a sound financial footing. Two-thirds of the ning land in the County is practically free n debt. The one-third, however, is badly olved. Persons whose business it is to ascer- the facts, give the indebtedness on the farms Hancock County at $20,000,000—an average $800,000 to the township—and remember, this ess than other counties in this state.
>
> This is a startling condition. It means that ny farmers are bankrupt and merely holding to the last minute the inevitable end. They trying desperately to plaster a little more their farms to tide them over to brighter ys. * * *
>
> 'There have been filed in the office of the corder at Carthage, more chattel mortgages in past eighteen months than have been recorded fore in the last eighteen years.
>
> "The hysteria of money spending, following the war, has not abated and will not cease until a breakdown in our economic machinery necessitates a return to sanity in living and dealing. * * *
>
> "And who is to blame largely for this situation? Profiteer money is seeking investment. Agents are competing for patrons. Rather than let a patron get away to a competitor he is nursed along with a loan. This loan grows. * * *
>
> "The lender often loses and the borrower goes broke. It is the price that is paid for this jazz period in our national history. And the lesson it teaches will not be heeded until lender and borrower regard with a new vision their responsibilities to their trust, to themselves, to their families and to humanity in general."

If Hancock County is more fortunate than any other in the State, what is the condition throughout Illinois?

Why Some Farmers Fail

Reporting on farm conditions in an area that includes Montana, the Dakotas, Minnesota, Northern Michigan and Northwestern Wisconsin, John H. Rich of the Federal Reserve Banking System, finds, that of the 388,242 farms embraced in the area 203,040 are classified as wholly or principally grain raising farms. Of the total number 5,388 are bankrupt, or being foreclosed, 9,302 are so involved as to be in imminent danger of bankruptcy, and 4,959 have been abandoned. The ratio of failures is 7.2 per cent. The heaviest failure record is in Montana, where the percentage of failures is 17.7. An analysis of failures in Montana shows that 51 per cent of those who went upon the land were without previous farming experience and 30 per cent had no capital. Among the causes of failure within the farmer's control, Mr. Rich assigns chief importance to lack of business capacity, including deficient experience, lack of thrift and lack of energy and application. Other causes are given in the order of their importance as lack of capital, poor farming methods, too much land, and too much credit.

Ship Loss of War Replaced; U. S. Largest Contributor

Construction of ships since June, 1914, shows that the world has made up for the tonnage lost in the war, according to the latest edition of *Lloyd's Register,* which states that the total tonnage of sea-going iron and steel steamers and motor vessels owned by the principal maritime countries of the world in June of 1923 was 57,939,000 tons compared with 42,504,000 in June of 1914.

The largest contributor to this incerase is the United States, with 10,579,000 tons; while Japan, 1,760,000; Italy, 1,330,000; France, 1,347,000, and Holland, 1,135,000, are next in order. Great Britain's share of the increase is almost negligible, for a country with such a shipbuilding record, amounting to only 200,000 tons gross.

Magic of Foreign Trade Contributes To Our Daily Comforts and Luxuries

TO emphasize the importance of foreign trade in the daily life of every American, the National Foreign Trade Council has recently published a study of "Our Imports and Who Use Them."

"The magic of foreign trade, which brings to your door-step the products of distant lands, is too often overlooked," says O. K. Davis, Secretary of the Council. "The dependence of the average American on imported materials is a revelation to those who have never given the matter any thought.

"Taking an ordinary day in your life, the influence of imported materials begins early. As soon as you get up in the morning, the genii of foreign trade begin to minister to your needs and conveniences. The East Indies have contributed their vegetable oils to your bath soap and shaving cream; your sponge is either a plant growth from the tropical waters of the Caribbean, or the modern imitation made of rubber from Sumatra and Brazil. You brush your teeth with fine bristles from the Far East, and smooth your hair with long vigorous bristles from China and England.

"Proceeding to dress, you call upon all parts of the world for your personal adornment. Silk worms in Japan and China may have contributed to your hosiery, shirt, and tie; imported wool enters into much of your outer clothing; your shoes are built up of material of all parts of the globe; your garters and suspenders owe their elasticity to the rubber plantation of Sumatra; while your white linen collar and your linen handkerchief are made of flax from Ireland, Canada, Belgium and the Netherlands.

"Hurrying down to breakfast, you find either coffee from Brazil, tea from the Far East, or cocoa from tropical countries. To sweeten these beverages you use sugar from Cuba and the tropics. Your breakfast china contains English clay, the glasses are wrought from foreign substances, and the knives, forks and spoons may contain imported aluminum and tin. You may start the meal with a banana from Honduras or a grapefruit from Cuba.

"Leaving your house, you walk over asphalt from Trinidad and take a train, the safety of which depends on air-brake hosing made of imported rubber. You may be lightening your travels by walking on rubber heels, and if the day is wet, wearing rubber overshoes and a rain coat. As you look over the morning news, you puff contentedly on a French brier pipe with a stem of hard rubber.

"You reach your office and sit down at a desk of mahogany. On the desk are to be found pencils tipped with imported rubber set in a tin holder. The finger grip of your pen is of cork from Spain or of rubber. The telephone and the dictaphone use imported asphalt, carbon, flax, mica, platinum, nickel, rubber, shellac, silk and tin in their construction. The typewriter in the office, and other pieces of office machinery, contain many kinds of alloy steels, often coated with nickel.

"At the end of the day you pick up your hat, which is made either of straw braids from the Far East, or of fur from all parts of the world. Lighting a cigarette of Turkish or Egyptian tobacco, you buy an evening newspaper, made of Canadian wood pulp, and start for home.

"That night, when you sit down for dinner, perhaps at a mahogany table covered with a linen cloth made from imported flax, you will partake of a meal flavored with foreign spices and sweetened with imported sugar; and when that meal is over you will take a Cuban cigar from the humidor on the table. Finally, when the evening draws to a close, you will go to sleep wrapped up in one more product of our import trade—soft linen sheets."

Mining In Alaska

The Department of the Interior says that mines in Alaska produced $20,300,000 worth of materials in 1923, as against $19,500,000 in 1922. The total value of the mineral output of Alaska since 1880 is $518,000,000. Measured by production, gold mining declined during the year, while the output of copper and coal increased about 20 per cent over that of 1922.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

NET gain of 73,200 telephone stations in 1923 in the territory served by it, is record of the Illinois Bell Telephone pany. All previous records for tele-ne station growth were broken in the mark set by the Company. The 1923 re was 13.3 per cent greater than the est previous year, according to a re- statement by W. R. Abbott, President he Company.

o obtain this new high mark, the com- y made a total of 197,361 telephone allations, and discontinued a total of ,081 telephones. The station gain in cago alone was 51,951. At the end of year the number of telephones in Chi- o was 692,645.

ince the first of the year the Company installed nearly 7,500 additional in- ments and on Feb. 21, the 700,000th phone was put into commission. It was alled in the private office of President bott. Forty-seven years ago—in 1877 our telephones were placed in service in icago as an experiment.

During 1923 the Company spent for ex- sions to its plant approximately $18,- ,000. For 1924, for similar work, the mpany will spend approximately $19,- ,000.

The additions are necessary to meet the nands of the public, and also to take care added use of the telephone. In 1922 daily average number of calls handled the Company was 4,154,931. This was reased to a daily average of 4,635,101 1923.

With the added telephone stations must provided additional plant. Every new ephone must have facilities for connec- n with every other telephone.

During the war the demands of the Gov- nment for both material and manufac- red goods used in the electrical industries s greater than for almost any other class commodities, and this demand took pre- dence over all other needs. The result s that, for some time after the close of e war, there was a shortage of equip- ent needed by telephone companies. This ortage and the rapid growth of Chicago d many other places in the state has ade it difficult for it to keep up with the mand for extension of its service. But it making great efforts to meet this demand, evidenced by its record of growth for 23.

The year has been an active one in every epartment of the business. The large rowth, as outlined above, has called for e most active work on the part of the En- ineering and Construction Departments, nd the increase in the number of tele- hones has naturally brought increases in e traffic, accounting and commercial work. he number of employes in telephone work Illinois is steadily increasing. The Illinois Bell now has on its payrolls more than 24,000 persons.

Although the station growth and the additional number of calls were large, the service both local and long distance, has been good throughout the year.

In June and August the Company placed in service in Chicago the first machine switching offices—Central and State—serving about 23,000 telephones in the downtown district of the city. The operation of these exchanges has been satisfactory and the subscribers are pleased with the service.

During the year the Company offered and sold common stock of a par value of $10,000,000, also an issue of $50,000,000 first and refunding mortgage 5 per cent bonds. From the proceeds of this sale it retired the first mortgage bonds of the Chicago Telephone Company due Dec. 1. The remainder of the funds will be used in the construction program.

Telephone Shows Nation's Growth

The growth of this country and general industrial activity is shown by the continued demand for the service furnished by electric light, power, gas and telephone companies. A specific illustration is the American Telephone and Telegraph Company and associated companies. The record-breaking year for the system was 1923, when it expended over $240,000,000 to enlarge and improve its service.

The 1924 program for the system will require about $270,000,000 for plant additions. These expenditures will be approximately $45,000,000 for land and buildings, $95,000,000 for central office switchboards and equipment, $35,000,000 for telephone and other equipment on subscribers' premises, and $90,000,000 for outside plant facilities.

These enormous expenditures are to take care of new business and will be distributed over every section of the country in line with the uniform policy adopted by the Bell system. It is expected there will be an increase of 15 per cent in Bell telephones over 1923.

Seven hundred automatic telephones have been sent to Shanghai and will be put in operation in March for experimental purposes by the Shanghai Mutual Telephone Company, according to the Department of Commerce. The telephones were supplied by L. M. Ericsson & Co., Stockholm. It is not known yet whether climatic conditions in Shanghai favor automatic telephones. Another uncertain factor is whether the public will pay the increased charges for such a service. If the experiment is successful, there may be a general adoption of the automatic system. This could not be consummated for at least three years, owing to difficulties in delivery and installation.

Don't "Cool Your Heels"

MUCH time is wasted by salesmen and others who call upon business men without appointment and are kept waiting in ante-rooms.

This can be avoided by making definite appointments by long distance telephone before you start on your out-of-town trip.

To Better and Increased Business

Letters of high character are more productive and cost no more.

Forty years of experience and service have equipped our organization to produce effective result-getting literature and direct mail campaigns.

We are fully equipped to do any kind of printing or letter work.

Our mailing lists are up to date, which insures maximum results.

We will fold and mail, relieving you of all the details at less cost than if done in your organization.

Creating business where your market is can only be done by careful analysis, effective sales copy and proper presentation.

Our Staff and Craftsmen will gladly serve you.

Advertising
is
the
Sunlight
of
Business

To all that is healthy and vital in business, it means increased strength and growth; but advertising is a fierce heat which withers and consumes that which is unsound.

A business which is not a good business should not be advertised. A business which would not benefit from widespread appreciation of its ideals had better acquire a new set of ideals.

QUALITY, PREPARATION AND SERVICE

To claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due MOTHER NATURE for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

HARRISBURG COAL

Burns to a White Ash — Is Hand Picked
Has a High B. T. U. — Is a Thick Vein Coa
Is Shaker Screened

Manufacturers News is published every Saturday by Glenn & Company, 76 W. Monroe St., Chicago, Illinois. Subscription price $4.00 a year; 15 cents a copy. Entered as second class matter March 4, 1912, at the Post Office at Chicago, Ill., under act of March 3, 1879.

Your Winter Coal Supply Burned Up Every Ten Minutes

COAL is a big item in your living expense. It heats your house, makes the electricity to light it and directly or indirectly is used for almost everything with which you come in contact.

In most cases a ton of coal goes a long way. It will produce enough gas to supply the domestic needs of an average family for more than a year, or enough electricity to burn one electric lamp all the time light is required for ten years. The Twentieth Century train will run ten miles on a ton of coal.

But the same ton of coal will produce only two tons of cement.

In few other industries is so much fuel required. Fuel is needed to produce power for the many crushing, grinding and pulverizing operations. Then the materials go to the kiln where the heat exceeds that needed to melt steel. Here coal or its equivalent is literally burned up by the carload. While the raw materials enter kilns as a finely ground powder they come out in pieces as large as a walnut. Again coal or its equivalent is needed to produce power for re-crushing, regrinding and re-powdering.

A large cement plant burns a ton of coal a minute—day and night. In ten minutes it consumes as much as the average family requires for its entire winter supply.

To make gas and electricity or to operate trains, a ton of coal gives surprising results. But the same ton of coal will produce only two tons or about 40 sacks of cement.

The Way of the Congress

YOU, too, have probably heard your friends remark that the Congress is delightful because it is fascinatingly distinctive. But perhaps they have not revealed the reasons for the distinction they find so pleasing. The explanation is not difficult. Atmosphere is an important asset. In this hotel it is born of service and hospitality. The manner in which the Congress gratifies the desires of its guests—its consistent policy of personal attention—is the basis of its unfailing popularity.

Manufacturers News

JOHN M. GLENN, *President and Editor*
JOHN J. GLENN, *Secretary and Treasurer*
JAMES C. GILRUTH, *Associate Editor*
NORMAN M. FRENCH, *Sales Manager*

A Progressive Trade Unionist

SECRETARY H. M. Comerford of the Independent Brotherhood of Steam and Electrical Engineers and Assistants of Boston, Massachusetts, is an unusual type of union man. He believes that trade unions should be incorporated and held responsible for violation of contracts. He has sent to MANUFACTURERS NEWS the following proposed resolution to be adopted by trade union organizations, with that end in view:

> *WHEREAS,* all labor unions become large business organizations with unlimited powers through their form of voluntary associations, which permits them to carry on their business without any supervision from any government tribunal or other agency whatever, and
>
> *WHEREAS,* no public record of the large sums of money they receive from their members through a per capita tax, and also their method of expending the same, is obtainable; therefore, be it
>
> *RESOLVED,* that all international, national, state federations, central bodies and federal unions of labor shall become incorporated within three (3) months from the date of this resolve becoming adopted by the Federal Government; and, be it further
>
> *RESOLVED,* that all laws (both Federal and State) now in existence or that may be hereinafter enacted for the purpose of governing corporations, be made to apply with equal *FORCE* to all Organizations of Labor (Union) now in existence, or that may be organized in the future; and, be it further
>
> *RESOLVED,* that all laws now in effect, Federal or State, that will interfere with the enforcement of this resolve be declared null and void.

Some day the leaders of organized labor in the United States will realize that they are responsible to the public as well as to organized labor. They already realize that in Great Britain. If labor unions were incorporated and if their officers took a firm position in favor of justice, law and order, instead of objecting to state police, metropolitan police, and district attorneys who enforce the law against murderous, violent and grafting labor leaders, the public would view with much more confidence and sympathy the aims and ambitions of organized labor.

Solving the Fuel Question

WHILE the soft coal miners and operators have been agreeing that war-time wages in union mines shall continue for three years, certain elements of progress and economic law are working to solve the fuel problem.

Electrical power is one. Every year, driven by excessive coal prices, more industries are securing their power from such concerns as the Commonwealth Edison Company, the New York Edison Company and the Hydro-Electric Power Commission of Ontario, Canada. The Commonwealth Edison Company alone will spend $30,000,000 this year in new constructions.

The use of fuel gas is constantly increasing in the industrial world, and also for heating purposes. The consumption of this fuel has increased 100 per cent in the last ten years. In 1910 only 5 per cent of the nation's total gas production was used for industrial heating purposes in factories and shops. In the subsequent ten years the ratio grew to 25 per cent.

Finally, there is the vastly increasing use of fuel oil.

Excessive prices for coal may be a blessing in disguise. They force the adopting of more efficient methods of fuel for power production and for heating. It is encouraging to note that the grip of the United Mine Workers on the throat of the consumer is necessarily relaxed as the labor monoply is attacked in the rear.

Non-union coal mines also are producing coal on a competitive basis.

Before the three years' contract with the miners is up, perhaps they will be glad to accept wages based on competitive and economic laws.

Who Pays the Most Taxes?

ON a final vote on the Revenue Bill by the House of Representatives, the Democrats and Republicans, including the radical branch of the latter party, compromised on a surtax rate of 37½ per cent for the higher incomes. The rate now is 50 per cent—too high to bring out the taxes, for the millionaires and multi-millionaires put their surplus into tax-exempt bonds. As a result, the middle class—if you want to call them that in this country—and the wage earners have to pay most of the taxes. There is nothing more remarkable than the obsession in Congress, and in the minds of the public, that the capitalists pay the greatest share of taxes.

In an analysis of the different classes of citizens recently prepared by William H. Barr, President of the National Founders' Association, the greater part of the nation's taxable earnings are shown to accrue from wages and salaries. He quotes the following figures from the Internal Revenue Bureau on the derivation of taxable American incomes:

Wages and Salaries	**$13,813,169,165**
Business	**2,366,318,610**
Partnerships, Fiduciaries, etc	**1,341,186,308**
Profits from Sales of Real Estate, Stocks and Bonds	**462,858,673**
Rents and Royalties	**1,177,957,882**
Dividends	**2,476,952,399**
Interest and Investment Income	**1,690,338,895**
Total Income	**$23,328,781,932**

A lower surtax rate would help the workers and small business men and manufacturers. Perhaps the Senate, which will next consider the Revenue Bill, may see the light.

Following a Good Example

FOR a number of years the Illinois Manufacturers' Costs Association has taken the lead in this country in emphasizing the importance of accurate cost accounting in manufacturing plants. Its noonday luncheons and evening meetings have been addressed by some of the most prominent accountants and cost experts in the United States. It has issued many reports and text brochures of practical nature after painstaking work by its committees. It has, we think, enabled many manufacturers to turn losses into profits—prevented some failures—put system in plants where rule-of-thumb methods no longer would work—lightened the load of the intricate Federal income tax.

But there is much work left for the costs advisers. It is gratifying to note that the Domestic Distribution Department of the Chamber of Commerce of the U. S. A. is taking steps to impress retailers with the importance of adequate cost accounting. It is preparing to distribute a "Retailers' Expense Series," devoted to salaries and wages, rent, advertising, depreciation, bad debts, and many other items which have not received the attention they should from many retailers.

Too Much Politics

THE state-owned flour mill at Drake, North Dakota, has been closed "until market conditions warrant its reopening." North Dakota's little experiments in socialization have not been more successful than Russia's. Efficient and economical operation is best accomplished by private ownership. Government operation of railroads failed in this country. You can rarely make a Federal or State management of business enterprise succeed. Politics invariably prove an insurmountable handicap.

Automobiles and Homes

IS the United States becoming a nation of Arabs characterized by motor cars rather than folding tents?

The Cleveland Trust Company points out that the American people are spending $2 for automobiles for every $3 of outlay for new buildings.

Well, what is wrong about it? One can live in an automobile in a pinch and save rent. It is also good for the health. Furthermore, it makes business good. During the last four years expenditures for motor cars have amounted to about $6,600,000,000 and the circulation of this mountain of money makes a great many people prosperous.

Man Is Only As Old As He Feels

Ask John D. Rockefeller, Cyrus H. K. Curtis, Thomas A. Edison, Frank Munsey, If They're Ready to Be Junked

Old Man For Sale

Clever at correspondence, concocting tchy copy, planning publicity, systemazing service.

In the fifties BUT healthy, alert, amltious, with ideas, ideals, initiative, inividuality, integrity and references plenty.

Employed up to recently, am seeking a alaried position that will afford full cope for my talents and worth-while xercise for an active mind and a willing eart. No soliciting, agency or "schemes" anted. J. W. L., 3604 Farragut Road, rooklyn.

WHAT AM I OFFERED?

WHEN is a man too old to be useful? When he reaches the point where he loses interest in life and gives up trying.

He may reach this point hen he is 40, 50 or any age beyond that, to 80. After he is 80, we suppose he n begin to prepare for the tomb, alough we have heard of some people of at age and over, who are quite frisky.

The advertisement which heads this ory was taken from a New York paper. e do not know how old J. W. L., is, but e is not ready to be scrapped. ou can tell that from his adertisement. Energy, initiave, courage and originality indicated in every line. We ppose by this time he has job. We clipped the adversement some weeks ago and ut it away with a lot of other tuff about old men who still re taking such an active inerest in life that they get into e newspapers.

Another thing we clipped at hat time was a picture of ohn D. Rockefeller playing olf. Mr. Rockefeller is in is 80's and, judging from a picture of him playing golf which was recently shown in he movies he still has a kick n him. He was walking over he links quite spryly and apeared to be in better physical ondition than his caddy, a middle-aged man who acted as hough he were tired. Probably John had given him a run for his money that day. It was interesting to watch the way Mr. Rockefeller raised his club for a drive or a brassie shot. He was quite deliberate about it, quite scientific and exceedingly serious. His stroke was timed perfectly. We do not know how much distance he got, but he hit the ball each time a noticeable wallop. Mr. Rockefeller does not pay much attention to business nowadays, but he still possesses all his mental faculties and a good deal of the physical force of a younger man, and this is largely because he has maintained his interest in life.

IS JOHN D. READY TO QUIT? P. & A. Photo
Looks Pretty Vigorous Yet, and Can Still Give the Golf Ball A Mighty Wallop

Still Going Strong at 73

Another man who is still going strong at the age of 73, is Cyrus H. K. Curtis, father-in-law of Edward Bok, who was so long editor of the *Woman's Home Journal* and who has lately made a lot of trouble for himself through his $100,000 peace award.

Mr. Curtis is a many-times-millionaire but he is not the kind of a man to sit all day in an inglenook and puff retrospectively at a churchwarden pipe. He has recently bought and taken possession of the New York *Evening Post*, a paper 122 years old, which has been famous for generations, but in business straits much of the time in recent years. Mr. Curtis intends to put this paper on its financial legs and it is more than an even bet that he will make it pay good profits within a year. In setting about this he has undertaken perhaps as strenuous a task as can be conceived by the human mind. Putting a newspaper on a paying basis is no job for a cripple or a man who has reached the lean and slippered stage which Mr. Curtis declines to, for a moment, admit.

In taking hold of the *Evening Post,* Mr. Curtis becomes a competitor of some other notable men, who are no longer in the springtime of youth. They are Frank Munsey, Editor of the *Sun,* the *Herald,* the *Telegraph* and the *Mail,* who is 69 years old and is still full of pep; Adolph Ochs, owner of the New York *Times,* who is 65 and still maintains active direction of his newspaper, and William R. Hearst, who owns the *Evening Journal* and *American* and is only 60. Arthur Brisbane, probably the most famous editorial writer in the United States, is a comparatively young fellow of 59 years.

Edison "A Bit Awkward"

Thomas A. Edison celebrated his 77th birthday on Feb. 11 and said he felt no older than he did at 40, but confessed to becoming a "bit awkward." He said he had been working on some new plans for automatic machinery during the last year, and is also giving some thought to what he regards as the most important electrical development to be worked out in the future. This will consist of a system of connecting power stations together and development of water power stations to operate the system and application of electric power to railways.

Another man who has passed beyond the Biblically allotted "three score years and ten," is Samuel G. Hoff of Kokomo,

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can—that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

Newsboy Energy and Success Boosts Ole Gullicksen to Head Big Business

NOT so very long ago—possibly the late '80's—there was a newsboy stationed at North Halsted Street and Grand Avenue, Chicago, whose energy and success in selling his papers made him conspicuous among the other boys. A few days ago this boy, now a man, placed an order in the East for 150,000 feet of mahogany timber, just an incident in a day's routine in the great manufacturing plant of which he is President and General Manager.

Ole Gullicksen

He is Mr. Ole Gullicksen of the Churchill Cabinet Company. The same energy and push that made him a success as a newsboy have followed him throughout his manufacturing career.

When you enter a New York telephone booth to find out when the next train leaves for Chicago you may not know it, but you are standing in a booth made in Chicago by Mr. Gullicksen's company. The Churchill Cabinet Company manufactures wood specialties, and is the largest establishment of its kind in America.

Mr. Gullicksen was born in Norway in 1876. When 4 years old he came to the United States with his parents, who settled on the Northwest Side of Chicago. As a boy Mr. Gullicksen attended both the Washington and Carpenter Public Schools, and later Souder's Business College. For seventeen years he was in the employ of Bauerle and Stark, manufacturers of cabinet work, where he gained a complete knowledge of the wood working industry.

In August, 1904, Mr. Gullicksen established himself in the business of manufacturing special wood products at 2119 Churchill Street.

Mr. Gullicksen is a member of the Norwegian Club of Chicago, Vice-President of the Dovre Club of Chicago, a member of the Union League Club, Chicago Furniture Manufacturers' Association, Chicago Association of Commerce, a Director in the Illinois Manufacturers' Association, and has been active in municipal affairs of his own city. He is also Treasurer of the Norwegian-American Hospital and for the past year he has been a director in the Noel State Bank, Chicago. He is married and has eight children.

A Man Is Only As Old As He Feels—Ask Rockefeller

(Continued from page 5)

Indiana. Mr. Hoff is 76 years old but this has not deterred him from taking a course in cost accounting at Kokomo night school.

"One is never too old to learn," said Mr. Hoff, who formerly was principal of a Kokomo grade school. "I am taking this course for my own satisfaction."

Reopen Baden Lead Mines

Owing to the loss to Germany of the Upper Silesian deposits and the Ruhr situation, the lead and silver mines in Baden, which have not been worked since the Thirty Years War, have recently been reopened. A project is under way to combine the various companies into a single association. Two of the principal companies now employ about 200 men on an 8-hour day basis. The value of the annual production of lead is estimated at $150,000, that of silver at $50,000. The total output is used for local consumption, according to a report to the Department of State.

January a Big Month for New Capital Flotations

January is usually a big month for the floating of new capital issues, and the first month of 1924 was no exception, the total reaching $536,082,690. This, however, was not exceptional for the opening month of a year, for January, 1923, produced the heaviest flotation on record—$881,211,911. A detailed analysis of the corporate securities put out shows that public utility issues in January, 1924, exceeded either railroads or industrials, the figures being: public utilities, $13,532,000; railroads, $72,432,337; industrials, $98,734,500.

A comparison of issues in January, 1924, with the four preceding years, as tabulated by the *Commercial and Financial Chronicle* of New York, follows:

1924	$536,082,690
1923	881,211,911
1922	467,143,499
1921	423,336,116
1920	488,225,639

These tabulations include the stock, bond and note issues by corporations and by states and municipalities, foreign and domestic, and also Farm Loan issues.

and
President, Illinois Society of Certified Public Accountants

I WANT to tell you of a case that I am sure will come under the Treasury Department's second class of unacceptable methods, the method ler which work in process, or some other t of the inventory, is taken at a nomi- price or at less than the proper value. this case a manufacturing organization built up an inventory of finished goods of semi-finished goods far exceeding quantity the corporation can hope to l within the next two or three years. is organization happened to have in employ a number of high-class mechan- whose services the company did not nt to lose, even though their services re not really needed at this time. The mpany felt that the time may come in near future when it would be greatly the company's advantage to have those chanics in its service. Keeping these gh-class, and accordingly high-salaried, en busy is what caused the excessively rge inventory of finished and semi-fin- ned goods. At the end of 1923 the offi- als of the company, realizing that it was ry greatly overstocked, assigned a more less arbitrary value to its inventory.

"Ideal" Cost:

Instead of using cost, which was pre- imably lower than market, the officials ed what might be termed an "ideal" cost, mely, they used unit prices that repre- nted what would have been the cost had e plant been operating at its maximum roduction capacity and at 100 per cent ficiency. This method was used on a ortion of the inventory; on another por- on of the inventory a somewhat more gical, but none the more acceptable meth- d was used, namely this:

Discount Applied to Inventories:

Instead of using cost or market, which- ver was lower, the company decreased the ost or market by 5 per cent in the case of oods that were expected to be sold within ne year, 10 per cent in the case of goods hat were not expected to be sold within one ear but were expected to be sold within wo years, and so on, the percentages anging all the way up to and including 0 per cent. These inventories that I have ust told you about were taken at the end f 1923, so that to date no representative f the Bureau of Internal Revenue has had ccasion to make an investigation covering he period involved, but I am sure that unless the company bases its tax return on inventories taken on a basis that more nearly represents cost or market, it will be laboring for the next few years under the burden of a contingent liability for additional tax, and the degree of that contingency will be such as to amount to practical certainty.

Now, in that particular case, had that concern been in the fix that a good many retail merchandisers find themselves in—that they had an accumulation of stock that was unsalable on account of damaged condition, obsolete styles, or other reasons—that would have been a different factor. But this particular concern deliberately went ahead and manufactured a stock of parts, and the only purpose in the world for doing so was the fact that they had men that it would otherwise have been necessary to lay off. They had no intention at any time of selling these parts at any less than the regularly established selling price. They did not intend to sell them as damaged goods, obsolete goods, or anything else.

Portions of Inventory Omitted:

The third method which the Bureau points out as unacceptable is any method by which portions of the stock on hand are entirely omitted from the inventory. Examples of this are seen in those cases where raw materials or work in process are omitted. The thing that the Bureau wants to guard against here is just such an extreme case as the error pointed out in the Bureau's second class of non-acceptable methods. There it was stated that inventories were not to be valued at merely nominal prices; here "nominal" reaches the point where it becomes "zero"—or, I might say, dishonesty.

"Base-Stock" Method:

The fourth method which it is stated does not measure up to the standards set by the Bureau is that by which a constant price or nominal value is used for a so-called nominal quantity of materials or goods in stock. An exact case of this came to my attention in a recent audit, and was, I believe, corrected after the same erroneous method had been in use for a good many years. This was a case in which the company had certainly been consistent, if ever there was a case of consistency.

This company was engaged in the manufacture of certain metal products, and required in its operations some 500,000 pounds of a certain kind of metal between the point where the manufacturing operation began and the point where the finished product appeared; that is, there was a continual "flow" of 500,000 pounds of this metal. When the company was first formed the market price of this metal was 2 cents a pound, and the company from that time carried in its inventories 500,000 pounds of such metal at 2 cents a pound. The balance of the raw material it carried at cost or market, whichever was lower. I might add that the present price of that metal is in the neighborhood of 25 cents a pound.

The technical name for the method of which I have just cited an instance is the "base-stock method," and is not acceptable to the Bureau.

This brings to mind one requirement by the Bureau that may at first glance appear somewhat odd, and which may in fact, under definite circumstances, present a certain peculiarity.

Inventories Carried Over:

The Regulations provide that, under the "cost or market, whichever is lower" method, any article in the inventory that has been carried over from the last inventory must be valued at the same price as in the previous inventory, and this, of course, must continue as long as that particular article is not disposed of. If, in the case just cited, the same identical metal had been carried all those years, that company would have been required to carry that metal at the same price in all its inventories; but that was not the case here, for the old metal was continually being used up and new metal being brought in.

It seems to be a very highly technical difference as to why one rule would apply, because they happened to have the same definite and specific material on hand, and another rule apply where they had exactly similar material, but not identically the same items.

Possible Peculiarity:

A peculiarity that could arise on account of this provision is that an article may be required to be taken into the inventory at a figure that is lower than either the cost or the market. Let us suppose, for instance, that a certain article or group of articles cost $75,000. By the time the next inventory was taken this article was still on hand, and then had a market value of only $50,000. It would then go into the inventory at $50,000.

In other words, it was purchased in August, 1923, at $75,000, but the cost or market, whichever was lower, on Dec. 31, was $50,000. It would then go into the first inventory at $50,000. When inventory time came around again at the end of the next year, the article was still on hand, but it then had a market value of something higher than $50,000, say $60,000 or $80,000 or $100,000. It would, under

---

(*Second of three installments of address before 4th Tax Congress, Illinois Manufacturers' Costs Association.)

the Regulations, have to go into the inventory at the same price as was taken in the preceding inventory, namely, $50,000, and that would be lower than either cost or the present market. The purpose of this provision is apparently to forestall a taxpayer from showing a profit or loss on dormant inventory.

That may not be a very good reason, but it is the only reason I have ever been able to discover that might in any way apply.

Goods in Transit:

The fifth erroneous method pointed out in the Regulations is the practice of including in the inventory any stock in transit, shipped either to or from the taxpayer, the title to which is not vested in the taxpayer. This is merely a commonsense proposition and amounts to this: you are not to include in your inventory that which belongs to someone else.

"Hedges":

In line with this is the case of "hedges." An inventory may not include transactions in futures or "hedges," such as are common with dealers in cotton, grain or similar commodities, and with manufacturers of products of those commodities. Whether the "hedges" consist of contracts for goods to be received at some future date or sales for future delivery, and although they are made to offset the simultaneous sale or purchase of the same quantity of the same commodity, the transactions are separate and distinct. The cost of goods actually purchased is not affected by the potential loss or gain upon a simultaneous future sale.

Smelting Companies:

A further illustration of the fact that inventories are to include only goods to which title is held is furnished by a case that came before the Solicitor. This was a case of a mining company which delivered certain ores to a smelting company under the usual agreement by which the smelting company is to retain as commission for its operation an agreed-upon percentage of the mineral recovered, the mineral content of the ore being determined by analysis before smelting operations are begun. It was held that since the ore from one mining company may become intermingled with the ore of other mining companies in the smelter yards, the transfer of the ore to the smelting company constitutes a sale and not a bailment, so that the mineral, whether recovered or not, is to be taken into the inventory of the smelting company as long as it remains in the smelting company's possession. In other words, whether or not any article or goods or merchandise is to be taken into one's inventory is determined by whether or not the title to that article or goods or merchandise rests in the person whose inventory is being taken.

In the particular case I have just cited, it probably would not make any difference. If it was taken in as accounts receivable, it might be taken in at the same amount as it has inventory value; but I just wanted to set forth how clearly the Department draws the line as to what can and what cannot be taken into an inventory.

This concludes, for the time at least, my discussion of the five methods specifically mentioned in the regulations themselves as among those sometimes used which are not acceptable to the Bureau. Other inacceptable methods might be cited in addition to these.

Cost of Hauling:

For instance, a corporation undertook to inventory certain materials at cost less an amount that would have to be spent in hauling those materials from a somewhat distant store room to the manufacturing plant. This method was rejected by the Bureau.

Whole Inventory at Market or Cost:

Again, the Bureau will not permit a taxpayer who uses the "cost or market, whichever is lower" basis to take his whole inventory at cost and his whole inventory at market, and then use the lower of the two: he must apply the "cost or market, whichever is lower" test to each individual item in his inventory.

There is one exception to this rule, and that is in the case of a taxpayer who happens to be in the business of dealing in securities. A dealer in securities may take his inventories all at market. Instances can very readily be brought to mind in the manufacturing trades, wherein it would seem that the use of market price applied to every item in the inventory would more accurately reflect the true income than would any other method. That, it seems to me would be true in any case wherein the inventory consists entirely of a standard article of everyday use, for which article the demand is greater than or at least equal to, the supply.

Example Where Use of Market is Apparently Excusable:

Consider, for instance, the case of a beet sugar plant. Beet sugar plants, as you all know, operate only during certain seasons. At the close of the season the inventory of that plant, if it has any, is all in the form of the finished product, and this product is one that, in normal times at least, has a more or less standard market price all over the country. Possibly that plant has already entered into contracts for the sale of that sugar, but the terms of the contract are such that title to the sugar has not actually passed on the day on which the plant happens to take its inventory. It would almost seem that in a case of that kind an inventory taken on any basis other than market would not reflect the actual conditions, and might actually be jeopardizing the rights of certain stockholders who purchased or sold shares of stock in that company at a price based on the earnings of the company, or the net worth of the company, which earnings or net worth were computed in part by the use of that inventory.

However, the Commissioner to date has not given his sanction to this method in any published ruling or regulation, and it is

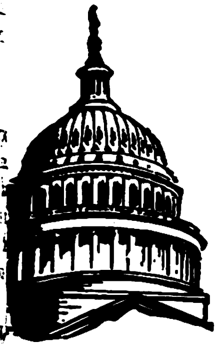
ax Cut Compromise Is Won In House

Republicans Win "Political Victory" As Bill Goes to Senate—Courage of President As Oil Scandal Grows



By JOHN M. TOWNSEND
Washington Correspondent, Manufacturers News

Washington, D. C., March 5.—Tax reduction legislation has been started on the high road to final enactment by this Congress by the passage through the House of a Republican compromise asure. President Coolidge adheres to support of the original Mellon Plan d will now renew his fight in the Senate have that plan adopted by that body. any event, taxpayers are assured of a duction of their taxes for this year by e-quarter, and the outlook for a final bill carrying a maximum surtax of not ore than 37½ per cent is od. Whether the President ll sign such a measure is t yet certain. In the mean- ne oil and politics prevail the moving factors in all gislative acts.

TAX LEGISLATION—doption by the Republicans the House of the Longworth ax Reduction Bill represents compromise in more ways an one. It represents an en break between the tax ans of Mr. Mellon and Sen- or LaFollette and knocked e legs out from under the emocratic measure which the aFollette wing helped pass st week, containing a maxi- um surtax of 44 per cent. resulted in the destruction f all paeans of triumph rafted by the Democratic aders in the House premised n the assumption that the arner Bill would be enacted. t also resulted in President Coolidge with- olding for the moment a public reitera- ion of his strong stand behind the Mellon lan. The Longworth compromise bill, xing a maximum surtax at 37½ per cent nd reducing normal rates to 2 per cent n incomes up to $4,000 and to 5 per cent n incomes between $4,000 and $8,000, nd applying the surtax at incomes begin- ing at $10,000 and ending at $200,000, nstead of at $100,000 as at present, rep- esented the best tax measure which could e got out of the House on the day the vote was taken. A month ago a com- romise for which all Democrats and most f the Republicans would have voted, ould have been had at 35 per cent. Proof f this fact is afforded by the final roll call n the adoption of the Longworth Bill, which passed 408 to 8, all of the Democrats voting for the measure and only eight Mellon stalwarts opposing it on the Republican side.

POLITICS VS. MORALS—The victory of the Longworth compromise measure is a political victory for the Republicans over the Democrats. It is not regarded at the White House or elsewhere as a moral victory or as a scientific tax reduction victory, such as is urged on Congress in the Mellon Plan. After being jammed all over the road by the Democrats and Progressives in the House, Mr. Longworth has undoubtedly scored a political triumph by welding the regular Republicans and the "conscientious objectors" among the Republicans together on a maximum surtax proposal as low as 37½ per cent. While Senator LaFollette of Wisconsin has kept out of sight nobody doubts here but that he approved of the agreement into which his followers in the House entered. At the same time nobody doubts but that LaFollette proposes to make another fight on the tax bill in the Senate, to propose new amendments to it, to fight to the limit for the right of Congressional Committees to have access to individual tax returns, if not for full publicity, and to accept the House Bill merely as a minimum of his demands. The President intends to fight in the Senate, as he has in the House, for the original Mellon Plan. On the surface the President faces more adverse conditions in the Senate than he did in the House, unless the Democrats come to the rescue. LaFollette has the balance of power in the upper house, and the Senate, unfortunately, has not recently voted for a lower surtax than 50 per cent, whereas the House went on record three years ago for a surtax of 32 per cent. Probably another compromise on the Bill will have to be made with the Progressives in the Senate, and this compromise will be followed by still a third agreement between the Conference Committees of the two houses. Not until then will be the final provisions of the Bill be known, and even then the Progressives will still hold the balance of power in both houses on adoption of the conference reports. Back of that the President holds a veto power, so that four hurdles of consequence confront the Tax Reduction Bill before it becomes a law. One thing can be set down as certain—this year's taxes will be reduced 25 per cent to all taxpayers.

POLITICS AND COURAGE—Despite the heavy drive on President Coolidge from inside the Republican party for the immediate resignation of Attorney-General Harry M. Daugherty, that official still remains in the Cabinet. Politically and personally the President undoubtedly agrees with his advisers that Mr. Daugherty is an embarrassment to his administration, but when did Calvin Coolidge ever decide any principle on the basis of personal fortunes or politics? While the enemies of the President have been busy with allegations that Daugherty's ultimatum has bluffed the President, the fact is that Mr. Coolidge, in the opinion of those on the inside, is showing more courage by not calling the bluff than if he called it. Daugherty honestly believes there is a conspiracy on foot to get his scalp and the scalps of other members of the Coolidge Cabinet and he also believes that if his enemies can get away with that kind of a fight President Coolidge himself may yet have difficulty in filling the vacant places with good men who would hesitate to face a hostile Senate. Daugherty also claims that the charges against him cannot be proved and that he can make and prove charges against his adversaries. Over and beyond this he has been wrought up to a high pitch of tension which has made it extremely difficult for anyone to reason with him. Back of it all stands his demand for a "square deal" and "simple justice," the right to hear the charges against him

under oath and to reply to them, and on that proposition he has the support of the President who will not demand his resignation until he is satisfied he has a full right to it beyond all reasonable doubt. There is no question the President did not like Daugherty's attack on Senator Pepper, because the President summoned the Senator to the White House himself to ask his opinion. Neither did Daugherty's attitude on other angles of the situation please the President, including his departure from Washington when the pot was boiling furiously. Nevertheless, because the President will not assist anybody to besmirch Daugherty undeservedly, he is taking a pounding from his friends and putting up with Daugherty's conduct calmly and deliberately. Action will be taken at any time the President is satisfied he has good and just grounds to act, but not before. As an exhibition of moral courage, at the expense of personal and political aggrandizement, the President's patience at this time deserves honorable mention.

POST-OFFICE SALARIES — Postmaster-General New has been compelled to ask Congress to forego an increase in the salaries of post-office employes, generally favored by the business interests, not because he does not believe they are justified but solely because an increase at this time will cost the Government approximately $150,000,000. The Post-office Department of the Government is only one of ten departments, all of which are suffering from the handicap of underpaid employes. If that Department is to have an increase, others deserve the same treatment. Tax reduction cannot be had if these increases are to be granted, merited through they admittedly are. Furthermore, there are now pending in Congress, as the President has recently emphasized, bills calling upon the Treasury for appropriations equal to the whole Government budget for this year. In this conglomeration of demands for public money the Post-office Department is only one of many just demands with which Congress should deal in the near future. Mr. New, therefore, has been compelled to ask Congress to investigate the situation thoroughly through a commission of its own and to devise ways and means to meet the deficit which the proposed increase in salaries will undoubtedly bring forth. The postal deficit this year will be $30,000,000 and if the increased salaries are granted it will be $180,000,000, all of which must come out of the Treasury. On the other hand, higher postal salaries are badly needed and the problem is a most difficult one to solve.

Illinois Felt Company Joins Central District Industries

The Illinois Felt Company, manufacturers of cotton felts for furniture, automobiles, and mattresses, 2501-2517 West 48th Street, Chicago, has leased from the trustees of the Central Manufacturing District, 15,000 square feet of sprinklered warehouse space in the one-story building on Pershing Road at Ashland Avenue.

The Illinois Felt Company was incorporated in November, 1911, with James D. Clark, as President, and William [illegible] Hoeft, Secretary and Treasurer.

Sales of the Company in 1923 were approximately $1,500,000; in 1922 $1,100,000. January, 1924, business exceeded that of January, 1923, by about $25,000. The upholstery product is sold largely to automobile trimmers and furniture manufacturers. About 60 per cent is marketed under the name of the Perfection Bedding Company, which is a trade name, registered for protection.

Ohio Safety Men to Meet

The Engineering Section of the National Safety Council will join with the Cleveland Safety Council, the Society of Ohio Safety Engineers, and the Cleveland Engineering Society on May 16 in a comprehensive safety conference in Cleveland. The general topics to be discussed are "Safety Legislation and Codes' and "Plant Housekeeping." The speakers will be J. W. Patterson, Hydraulic Pressed Steel Company; Dr. H. C. Davis; J. M. Woltz, Youngstown Sheet and Tube Company; F. C. Allen, New York and F. A. Scott, who will act as Chairman at an informal dinner following the morning and afternoon sessions.

Exact Inventory a Prime Necessity for Tax Returns

(Continued from page 8)

not likely that he will make such a ruling. The Commissioner, wherever at all practicable, undertakes to keep income tax procedure in close accord with the best accounting procedure, and the best accountants argue strongly against the use of market values where higher than cost, since the use of market values in such case would reflect as earnings, income that had not yet been realized.

Application of Constant Price to Groups:

A further method that has not been officially recognized is that of applying a constant, or average, or nominal price to the various groups of articles that make up the inventory. This method, it will be noted on close scrutiny, somewhat savors of the "base-stock" method, in that both have the feature of using a constant factor.

Similarity of Unacceptable Methods:

The fact of the case is that practically all of these unacceptable methods that I have discussed bear evidence of similarity one to another, so that after all it isn't such a difficult matter to arrive at a concise summary of what the Bureau of Internal Revenue will permit in the way of valuing inventories, and what it will not permit.

Proper Procedure Summarized:

You have adopted your method, either "cost" or "cost or market, whichever is lower;" whichever you have adopted, apply it consistently to each and every article or group of articles in your inventory. When you've done that, add up your extensions, and then stop. That's all there is; there isn't any more.

fficiency As Applied to Cost Work

Graphic Charts for Executives, Detailed Operation Costs to Foremen—President Watches Sore Spots

II.

By H. B. STONE

Industrial Engineer,
Evens & Howard Fire Brick Co.,
St. Louis, Mo.

THE following article, the second of two installments, is an abstract of an address delivered by Mr. Stone before the Southern Division of the Illinois Manufacturers' Costs Association at St. Louis.

SUPPOSE your normal burden is $50 for a day on a given item and today it is running over that, to $75. Then you have 150 per cent cost burden that particular item. Now, are you ply going to charge that up and say, r costs are so much higher, consequent- we must sell at a higher price to make ls meet," and go out and buck your rket on that basis? We all know that suicidal.

We know that the market governs your ling price, and if you make bids based fictitious costs then your asking price going up and you are not going to get business. If your output is 100 per it and your normal burden $50 and by s remedy you reduce your output 50 r cent, then your burden should be $25. t, say it is $75; you are only 33⅓ per nt efficient. If your efficiency is down at low you'll have to do something. If u are carrying those figures in your mind at way—by comparisons of efficiency on rticular items—then you are in a posion to control the particular item. You ow exactly where you are.

The old-time proposition used to be, ien things were getting tight, to say, "Let's t wages, we can save money that way. rop off a few cents here and there and at will take care of the situation." If u do that, all you may be doing is to crease your inefficiency. You can do tter by increasing your selling price and ducing your volume. If you can pick it the particular item which is the cause the inefficiency; if you can train the an in charge of the department—the supintendent or foreman—to study costs and t him have the detailed costs, if you can iow him that inefficiency and itemize your osts, then you will control.

We make a 4-inch pipe. It is the smallst pipe we make, and everybody thinks it ught to be sold cheap. Yet it is the most xpensive, because it is too small to handle. press operating on 4-inch pipe will turn ut sixty tons of material a day and the ame press operating on 8-inch pipe will urn out 125 tons a day. Supervision, axes, etc., are the same under both conitions, but the tonnage will be cut in two.

I think a superintendent or foreman, the iead of a department, ought to have deailed costs. They are interesting to him ecause he is working for detail operation, ut when the details go up to the General Manager you have lost all the effect of our cost system. He won't read them. He is justified in not reading them. It akes too much time to go through all those letails and it is not necessary if we have a cost engineer on the job or a cost accountant who analyzes from the engineering standpoint. I don't care which he calls himself, if he will only break down those costs into general causes for effects and put them up to the executive at the head of the plant.

Executives Don't Read Costs

An executive or general manager should never have to read more than one page of costs; should never have but one page before him at one time. If you can boil it down to one page he will look at it, and it can be done if it shows something analytical. If you merely show that cost is higher now than it was at this time last month, he will suppose there is something wrong and he will jump—sometimes in the right direction and sometimes in the wrong direction—but he is going to do something. If you can tell him why this occurred; if your costs are properly arranged so they show individual efficiency items; if you can run it down to individual costs; then he has something to start on—he knows which direction to jump.

As to presidents of corporations, give them a graph; don't give them a cost sheet at all. Show them a line which goes up or down. They have time to look at a picture and they can tell at a glance what it is all about. Once in a while we have a president who has come through a school of accountancy and he will take time to go into a cost sheet in detail, but the average executive only has time to look at a picture. He will ask the General Manager what caused it and the General Manager will tell him by looking at the analytical sheet. The executive will say, "You do something about it," and the General Manager will go to the Cost Department to see the detailed costs.

The chief executive can't look after every detail of his business all the time. The only things he has time to attend to are the ones that are sore. If a man goes around with a rag on his thumb he is the one that needs attention. If you had a doctor at your plant and had a thousand men in your place and asked him to examine them every day you would give him a real job, but if he only examines the man with a rag on his thumb then he can tend to him properly.

If an executive finds his cost line is going down it is a worry off his shoulders. If it is going up, as he can see from a simple chart, then he can ask why. So it is only the up lines in the chart which he needs to fear.

Standard Budget Control

Let me say a word of our systems of budget control. What are they? Nothing more than a standard total cost, that is all a standard budget is. If you decide to spend so much money here, that is budget distribution to a particular department. The only fault I find with them is that when you allow so much money to a department, they think that's the minimum instead of the maximum and there's considerable effort to try and spend it. Efficiency control means knowledge of whether you have reached your budget standard or whether you have approached it.

Another point I want to emphasize is giving the costs to the foreman. You all know the foreman is the man who represents your company to the man on the job. He is the company, as far as the individual workmen are concerned, and he is the real spender of the company's money. I don't care whether he handles cash or not; whether he pays any bills or not, he spends it in hours of time, in material worked upon, either spoiled or made properly, he spends it on wasted time, on repairs and maintenance. He is the man that spends your money and the man that represents the company to the workmen.

How much do your foremen know about costs? If you ask the average foreman what is meant by "burden," he will tell you, "the load you carry," and if you ask him what "burden" means in costs, it will be Greek to him. He doesn't know that expense is burden, and why doesn't he? Because most managers haven't trained him; they never gave him an opportunity to find out what it means.

We are going through an experiment of less loss or better ware, trying to interest the workmen in saving these losses. If the foreman keeps in mind how much it is going to add to the cost of a good piece to scrap another, he will be more careful. If you can interest him in the campaign for better ware, the reduction of waste and breakage to a minimum, and can make him see that if he will reduce this, say 10 per cent, he can get some of it in his pay envelope, then you will gain in efficiency. It isn't necessary to give the foreman all your costs—if you haven't enough confidence in him to tell him what you are doing in your business or you are making such an immense profit that you're afraid he might ask for an increase—but you can give him operating costs, and if you do you are developing an efficiency expert who is directly in touch with the men. The average foreman knows what direct labor expense is, and the average workman considers labor cost the only cost in a manufactured article.

Pacific Coast Safety Men To Meet In San Francisco

Industrial safety and health, and public safety, will be discussed by prominent leaders in the safety movement at the Pacific Safety Conference to be held at the St. Francis Hotel in San Francisco, April 7 to 9. The meetings will be under the joint auspices of the Society of Safety Engineers of California and the Engineering Section of the National Safety Council. The first three sessions will be devoted to Industrial Safety and Health and the fourth to Public Safety. Plans have been made by many safety men in Washington, Oregon and California and Texas to attend this first big safety conference of the Pacific Coast.

Lewis A. DeBlois, President of the National Safety Council, and Sidney J. Williams, Chief Engineer, will attend the sessions.

Lieut. Gov. Sterling Termed "Able, Tactful, Impartial"

Hon. Fred E. Sterling, who has made both a popular and able presiding officer over the Senate of the State of Illinois, is again a candidate on the Republican ticket for the high office of Lieutenant-Governor, subject to the primaries of April 8th.

Matzene Photo

Hon. Fred E. Sterling

Lieut.-Gov. Sterling has presided over the sessions of the Senate in the 52nd and 53rd General Assemblies, and so able, so eminently fair was his handling of the intricate parliamentary questions that necessarily arise in such a body that both Republican and Democrat Senators warmly commend his ability and tact for his impartial decisions. In fact, the numerous letters of warm friendship from the men over whom he presided for three years, regardless of political factions, is one of the strongest and most remarkable commendations of his work.

Mr. Sterling is Editor of the Rockford (Ill.) *Daily Register-Gazette*, one of the leading Republican newspapers of the state. He was born at Dixon, Ill., in 1869, but spent several years of his boyhood on his father's farm at Huron, S. D., in the pioneer days of the Territory. He has taken active part in politics in Illinois for many years and has held several appointive and elective offices in the state. He is a member of a number of fraternal orders and social clubs, and has long been an active member of the Illinois Press Association.

Officers of The Netherlands Chamber of Commerce in New York, Inc., were recently elected as follows: President, William C. Redfield; Vice-Presidents, W. van Doorn and Pablo Homs; Treasurer, Elias A. de Lima; Secretary, L. Wittert van Hoogland; Publicity Director, Neil van Aken.

A TRIUMPH IN RADIO
The Single Tube Radio Frequency Receiver
Performs the Function of 2-Tubes — as Radio Frequency Amplifier and Detector
Only One Control Amplifies As It Detects All Wave Lengths
$10.00 Without Tube Including Two Interchangeable Inductance Coils for Wave Lengths ranging from 200 to 600 Meters.

NATIONAL MONODYNE
Pat. Trade Mark Pdg.
TUBE SET MODEL GT-1

The MONODYNE CIRCUIT is one of the most radical advances in radio engineering since the advent of the Armstrong Circuit. Parts heretofore considered essential are omitted and one simple tuning control gives selectivity equal, if not superior, to that of sets costing hundreds of dollars. A child can operate it.

SIMPLICITY The NATIONAL MONODYNE uses but one dry cell tube, preferably the WD-12 or any other standard dry cell tube, such as the UV-199 or C-299 types. Local broadcasting comes in astonishingly loud and clear, without distortion.

The tube socket is of a new design and most practical because it holds the tube with a positive grip on all four prongs for a depth of more than one-quarter of an inch.

The NATIONAL MONODYNE AIRPHONE will find especial favor with experimenters because of its adaptability in many different hook-ups, a thing not possible with any other low priced outfit.

LONG DISTANCE In our New York laboratory tests, we repeatedly heard stations KYW at Chicago, WOC at Davenport, Iowa, and many others, quite loud and clear. This without resorting to any mode of amplification.

The NATIONAL MONODYNE is the most practical tube set made, and is complete in all details. It is only 6½ inches long, 4¼ inches wide, and 2¾ inches high, of durable, compact and rugged construction. The entire casing is moulded from hard rubber composition.

The NATIONAL MONODYNE has a receiving capacity and range of about 1,500 miles. 75-foot aerial is recommended for best results.

No more hunting for stations. You know in advance at what point of the scale your favorite station is located. Only the highest priced sets accomplish this

Amplifiers - for loud speaker - $8.50 without tube

What Are You Looking For From a Printer and Binder?

Equipment The necessary modern efficient machinery and buildings to economically and speedily produce the printing and binding required.

Personnel An organization of thoroughly trained men and women to operate the plant and deliver according to agreement, both as to time and quality.

Experience Forty-six years of active continuous operation under the same name and management.

Our advice is to place your printing and binding with a firm that you know has these qualifications.

Your inquiries will be given our utmost care and attention.

Iow a Union Handicaps Individuality

Ironclad Rules and Practices Bind Workers to Dead Level—Mental Reaction of Family Told by Daughter

By VALERIE M. GRUSTRIERS

Written for Manufacturers News

LABOR unions set a minimum and maximum wage, the maximum amount of work an employe may do, and just about regulate his every movement, ar as his work is concerned. He may ust so much work and no more. If he en doing more than the standard set he union, some fellow worker will re- him to the Chairman, who will report to the Business Agent, the Business nt in turn calling the attention of the l's officials. He will be called before Trial Board and reprimanded. If he been especially diligent, he will be d and his position taken away from ; or, in more extreme cases where he been previously warned, but disregard- he admonition, he will be thrown out the union. For what? Because he ked harder than the next man in order aise himself out of the old rut!

labor union will not allow a man to more work than the amount set for particular job. He must confine him- to the same level and be content to k there the same as the inefficient and ifferent brother. Let him try to help self, and the union will make him rue as the union works on the theory that men are alike and equal.

Iow can one man be a better worker n another? Why should one man be moted or get an increase in salary ner than the man at the next desk or ch? One man's work should never be erior to that of another's. The union ks upon this as unfair, for how can one n excel another in exactly the same and kind of work? The union's very stence rests, in part, on the absolute vention of such a distinction.

When the firm has a bigger job or posi- n open, the boss must look elsewhere n to the union man to fill it. As long a concern is prospering there will al- ys be room higher up, but with the force rking like so many puppets, even the ewdest employer will have a pretty puz- as to which one of his men is competent handle the job. Organized labor will er let any man work in one place long ugh for the boss to take "favorable ice" of him.

Furthermore, promotion would prove astrous for the deserving man, as his workers would accuse him of being in lusion with the enemy, the "capitalist" o employs him. Such treason would be nished by methods only too well known every union man or any one knowing union way of enforcing its decrees.

The union man brags to the non-unionist his advantage in not having to smile or "Good Morning" to his employer either to get some favorable notice or any notice at all. The union takes care of that for him, so he scowls instead. Very true. However, I find in my little memo book that it takes 64 muscles to frown and only 13 to smile. "Why work so hard?" to ask their own favorite query.

Unionism Crushes Initiative

The late Dr. Steinmetz was a Socialist, but I doubt whether he would have been the wizard he is acclaimed had he been tied up by a union card. Perhaps he did want to belong to one, but was not admitted. Who knows? It would have been inconsistent with the union's principles to let him, or any other man, work the long hours Steinmetz is credited with having put in in his laboratory.

MISS VALERIE MILDRED GRUSTRIERS has had some personal knowledge of labor unions; her father is a union man and his experiences have led her to make the statement that "if I had to join a union, I would jump into the lake first."

This article shows the reaction of the family of a union man toward the restrictions placed by organized labor on the progress and initiative of the workers who are enthralled in the meshes of unionism.

The man with an eye to the future will not be tied down by a union. It is only the incompetent, indifferent and ignorant ones who are strongest in favor of unionism. They either cannot or will not work for the betterment of their future. They rely on some one else to furnish the energy, the initiative, they lack. The organized man will go on a strike when he wants a promotion or an increase in salary; the unorganized man will look about for ways in which he can earn it. The former will bank on another's brains and backbone to get for him the things he wants; the latter will get it for himself, and if he fails, will try again, profiting by his first experience. He does not need to depend on any one else's influence, because he knows that, if one employer ignores his efforts, another will appreciate them.

The non-union man might envy some man's wealth, but instead of hating and wishing to destroy it and its possessor, he will let the vision of the other's success act as an incentive when it comes to up-building his own. He knows that it was not by sitting back and *wishing* that the other became successful. He knows that it took hard work and lots of it, for several generations perhaps, to create such wealth. Whereupon he pitches into his work with a will, and is thereby far happier than the man with the wishbone for a backbone. We are not living in the day of the fairy godmothers who appear suddenly to grant the customary three wishes. Though if they did, it's a cinch they wouldn't pick on the habitual wishers. No man ever got any where by walking down "Wishbone Way," and the union man is too often of the type that is too indifferent to exert himself to take another ~~road.~~ ~~If~~ he weren't, he wouldn't have to be a union man. ~~I know~~ whereof I speak.

Not A Word Against Union

What if the non-unionist's wage or salary is smaller when it comes to collecting the weekly pay enevelope? Wait a minute. The union man wants a raise. He strikes for it. The non-union man goes right on working, and the yearly income is made even. The union man gets his raise, and union dues go up, a special assessment is levied on him—the score again becomes uneven with the union man holding the short end. He doesn't know any better himself, and no one dares to put him "wise." It isn't at all healthy to open your mouth against the union.

The intelligent worker at the moment may join, or be compelled to join, a union; but it would have to be an altogether different sort of union that would appeal to the self-reliant man. A union, with a membership of the present type of organized men, would not survive very long on making its men stand on their own feet, because the union men have no inclination to work on their own hook. Certain kinds of organized skilled labor may require brains and ability of some sort, but not enough to enable their owners to function independently. Furthermore, the union doesn't want them to, as independent self-expression is its greatest bugbear, and would sound any present-day union's death knell if not instantly nipped in the bud on showing the faintest sign of asserting itself.

In other words, where one man is limited in his accomplishments and achievements by his own ability only, the other is held down by iron-clad rules and practices to a dead level, and not a very high one at that.

TRANSPORTATION

Railroad Phrases, Often Misunderstood and Misquoted, Are Made Clear by President S. M. Felton of C. G. W. Ry.

STATEMENTS of railroad operations are often misunderstood and frequently misquoted, both by public speakers and in the public press, according to S. M. Felton, President of the Chicago Great Western Railroad. Accordingly, Mr. Felton has gathered several of the most important railroad terms and phrases, such as are frequently heard but, he says, are as often misunderstood, which he has clearly defined and explained, thus assisting to a clearer understanding of the terms employed in stating the results of railway operations:

RAILWAY OPERATING REVENUE—This consists of all revenue received by the railway for transportation services, including freight, passenger, mail, express and other allied services. This also includes revenue arising from storage, demurrage and other activities incident to the performance of transportation; in fact, all revenue growing out of the transportation activities of a railway.

RAILWAY OPERATING EXPENSES—These are the expenses incurred in connection with the performance of transportation services, including maintenance of fixed property, locomotives and cars, together with the expenses of wages, fuel, material and supplies necessary for repairing the roadway and equipment, and for the movement of traffic, but not including taxes or payments for the use of other companies' equipment and property used jointly.

NET REVENUE FROM RAILWAY OPERATION—This is the Operating Revenue of the railroad, as defined above, less the railroad's Operating Expenses, as above defined.

NET RAILWAY OPERATING INCOME—This is the Net Revenue from Railway Operation less taxes, uncollectable revenue, payments for use of other companies' equipment and facilities used jointly. This is the amount which the railway company realizes from its transportation activities, and is available for the payment of rentals of leased lines and interest on indebtedness; the reminder, if any, may be carried to surplus or applied to dividends.

REASONABLE RETURNS—The Transportation Act requires the Interstate Commerce Commission to ascertain the value of railway property and name a reasonable rate of return upon the same. The rate thus fixed, however, is not in any sense a guaranty. This rate they have fixed at 5¾ per cent. A railroad, whose value has been ascertained by the Commission to be $100,000,000, and whose "Net Railway Operating Income" is $5,750,000 annually, is receiving the "reasonable return" of 5¾ per cent upon its property, as fixed by the Commission.

The Net Revenue From Railway Operation should not be confused with Net Railway Operating Income. The necessity of this is apparent when it is realized that the net revenue from the railways' operation of all Class I railways and large switching and terminal companies in the United States in the year 1922 was $1,161,602,440, while the Net Railway Operating Income was but $776,665,960, a difference of $384,936,480.

All the railroads of the United States are required by law to make reports under oath of their activities to the Interstate Commerce Commission, using the terms above which are prescribed by that Commission. These reports are on file in the Commission's office at Washington, and are available to the public.

Montreal as a Shipping Port

There are 300 ports and harbors on both the Eastern and Western coasts of Canada. The majority of these harbors are, of course, small affairs, the big ports not exceeding six. However, one of Canada's ports, Montreal, ranks sixth among the world ports. This is a remarkable fact when it is considered that the port of Montreal is open only seven months in the year. On the basis of export business during that period Montreal ranks as the world's third largest seaport.

C. & N. W. to Canadian Rockies

As a result of the recent visit of Sir Henry Thornton to Chicago, announcement is made of a more direct route between Chicago, the East and South, the Canadian Rockies and British Columbia Coast.

The Canadian National Railways in conjunction with the Chicago & North Western Railway, will establish on Saturday, June 7, through service between Chicago and Winnipeg and Jasper National Park, the largest National Park in the Dominion of Canada, and where the railway company operates a high class hotel.

This service will mark the inauguration of the first through service between Chicago, Winnipeg and the Canadian Rockies. West of Winnipeg the Continental Limited, the crack daily trans-continental train of the Canadian National Railways, will be used. Between Chicago and Duluth the route will be via the Chicago & North W ern Railway, and between Duluth, Win peg and the British Columbia Coast, v Canadian National Railways. This n service will not only provide a more di route between Chicago, Winnipeg and t British Columbia Coast of Canada, but will take the passenger through a porti of Canada that from a scenic standpo is incomparable.

Trains will leave Chicago daily 5: P. M., arriving at Jasper National Park a 8:20 A. M., the third morning. Eastbou the train will leave Jasper National Pa at 9:30 P. M. daily, and arrive in Chica at 11:45 A. M., the third morning.

Farmers and the Railroads

Light has been recently thrown up the campaign of the farmers for lowe rail rates by the Chairman of the Northe Pacific Railroad Company. Here are som of the facts he cites in a letter to Senato Cummins:

The rate of return earned by the North ern Pacific on a sum representing the prop erty investment, the materials and supplies and a moderate working cash capital fo a term of years has been as follows:

		P. C
Pre-war period	1916	6.7
Pre-war period	1917	5.9
Government operation	1918	4.6
Government operation	1919	2.
Part Government, part owner.....	1920	1.4
Owners' operation	1921	1.9
Owners' operation	1922	3.5
Owners' operation to Sept. 30.....	1923	2.1
At annual rate of..............	1923	*2.8

*Estimated.

Substantially the same officers and men that produced a fairly good return in 1916 and 1917 have been with and still are with the property, but they cannot overcome entirely the conditions developed out of war and Government operation. For example,—

The increase in wages in 1922 over 1917 was	$13,165,5
The increase in taxes in 1922 over 1917 was	1,519,8
The increase in fuel costs in 1922 over 1917 was......................	2,186,7
A total of	$16,870,1

These three items alone are equal to 6.8 per cent on the company's stock.

Net profits for 1923 of the Chicago Railway Equipment Company were $1,097,321, equivalent after preferred dividends to $14.80 a share on the 59,936 shares of $25 par common stock outstanding. Dividends of $3, or 12 per cent, were paid on the common stock.

Made-to-Order INDUSTRIAL BUILDINGS

It is better to build, rather than to purchase a plant ready made. ❧ It is cheaper. ❧ A factory or warehouse constructed for someone else, requires considerable remodeling to meet your needs; even then it may not turn out satisfactorily. ❧ But when you order a *Central Manufacturing District* plant made-to-measure, you are assured of getting just what you want, when you want it, and at the lowest cost. ❧ We are organized to build factories that suit. ❧ All our plants are on private Chicago Junction switchtracks, assuring efficient freight service. ❧ We finance building. ❧ We will handle everything for you — land (purchase or rental), building plans, and construction. ❧ That is our business.

WEST PULLMAN AND IRONDALE.

Manufacturing Locations for Sale

Along the line of the Chicago, West Pullman and Southern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad, the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound, with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Chicago, West Pullman and Southern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

FOREIGN TRADE

Spite Fences Erected Throughout Europe Great Obstacle to Complete Restoration of Normal Commerce

WE are living in a world of flux and change, with the situation so fluid that no man can tell what is going to happen tomorrow. The Maine is blown in Havana Harbor, or a fanatic shoots Archduke Franz Ferdinand in the sleepy osnian town of Sarajevo. The immediate casion of the great Thirty Years War as the treatment in Prague, Bohemia, of vo emissaries of the Austrian Emperor, ho were thrown out of the upper window the castle, and the local conflict thus arted spread all over Europe," said Aled P. Dennis, Special European represenntive of the U. S. Department of Comerce, before the recent Farmer-Manufacrer Convention, Chicago, on the subject, American Trade and European Psycholgy." Mr. Dennis had returned to Washgton temporarily, after a service of five ears in Europe as economic investigator or the Government. In speaking of the uropean trade situation, Mr. Dennis connued:

"The chief obstacles to our trade with Europe are found first, in impaired purchasing power of the impoverished countries and, second, in the ultra-nationalistic psychology of the European peoples. International spite fences have been erected. Obstacles have been thrown across natural trade currents and the restoration of normal commercial intercourse awaits the re-establishment of peace in men's hearts. The French occupation of the Ruhr is a spectacular illustration of the artificial barriers to international trade.

"Our commerce is suffering along with that of the whole world, but our trade with Europe is by no means prostrated. We sold during 1923 more hog products in Europe than in any year either before or since the war. Europe is taking, and at high figures, nearly all the raw cotton we have to spare, and even in Germany the spinners apparently have little trouble in financing cotton imports. One of our great agricultural implement concerns has sold nearly as many harvesting machines in France during the past year as in the whole of the United States. Wheat is the weakest item in our foreign trade. It is not that the Europeans are eating less of our wheat or that they are too impoverished to pay for it. It is due to the fact that there are perhaps no less than 300,000,000 bushels more wheat in the world today than there was at this time a year ago.

"We may as well acknowledge the fact that we are being beaten in the wheat export game by at least three important competitors and that our farmers might be better off if they would diversify their crops and cut down their wheat seedings. If we could cut our wheat production by 20 or 25 per cent, the farmer would get the Governmental help he clamors for in the way of tariff protection. So long as we have a surplus of 180,000,000 bushels of wheat we cannot raise by 1 cent a bushel the export price of this surplus through legislative action.

"Though we are at a competitive disadvantage in the growing of wheat, we possess in certain manufacturing lines and in our financial strength clear superiorities when it comes to world competition. Despite higher wages we can produce certain things—such as cheap automobiles, adding machines, typewriters, sewing machines—cheaper and better than any other people in the world."

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

AUSTRALIA—9303, salmon and sardines, canned, 100 to 300 cases.

AZORES—9332, wheat, soft.

BELGIUM—9346, salmon in boxes, large quantities.

BRAZIL—9291, road construction machinery.

CHINA—9290, celluloid; machinery for making celluloid toys and novelties; 9347, tinplate.

COLOMBIA—9327, capping and sealing machinery for butter glasses; dairy machinery for making butter and cheese; glasses for butter, one-half pound capacity, 50,000; 9299, poultry—light brahma, plymouth rock, and leghorn.

CUBA—9305, scows, dump mud, new or second-hand.

CZECHOSLOVAKIA—9348, cadium sulphide; selenium.

DANZIG—9342, bags, jute, lined with paraffin paper, 10,000.

DENMARK—9304, copper, zinc, and brass sheets for photo engraving; 9318, cotton, sanitary; 9314, cacao, beans; 9315, cacao, raw; 9326, cigarettes, cheap; 9317, fruits (prunes, apples, and apricots); 9316, glucose in barrels; 9310, silk, artificial; 9326, shag tobacco; 9310, yarns.

ECUADOR—9335, wheat grinding mill.

ENGLAND—9320, fancy paper for box making; paper-writing, printing, and wrapping.

EGYPT—9313, pumping machinery.

FRANCE—9313, twine, sisal binding.

GERMANY—9330, milk—condensed, sweetened, and unsweetened.

GREECE—9321, beehives; bee-keeping equipment; 9311, emery stone grinding machinery; 9309, machinery for making nails.

IRELAND—9331, bacon in boxes, 50 to 100-ton lots; cottonseed meal, decorticated, 50 to 100-ton lots.

LATVIA—9364, plows; road construction machinery; road scrapers; stone crushing machinery; portable motor; tractors, steam or motor; wagons.

MOROCCO—9312, artificial silk tissues, cheap; artificial silk thread in spools.

NEW ZEALAND—9325, cottonseed oil; glucose and other supplies for bakers; oils, edible; 9343, paper, newsprint; rubber goods, mechanical; rubber tires.

NORWAY—9363, corn; cottonseed meal.

PORTUGAL—9329, chamois in colors and white, for gloves.

SPAIN—9292, agave; 9301, collars, soft white, for men and boys; 9292, hennequen; jute; yarns.

SWITZERLAND—9349, artificial leather for automobile tops; automobile body accessories.

TURKEY—9324, wood saws, all kinds.

VENEZUELA—9343, automobiles; automobile accessories; cloth for salt sacks; flour; hardware; mops; mop wringers; sugar mill machinery; uniform cloth, military.

WALES—9323, pit props, stripped, 1,000 to 1,500 tons.

Export Managers to Meet

The annual "Get-Together" meeting of the Export Managers' Club of New York, Inc., will be held in New York City on March 18. The subjects for discussion will be "Formulating Policies that Meet New Conditions"; "Helping Dealer Move Stocks"; "Local Advertising in Foreign Markets"; "Sales Quotas in Foreign Markets"; and "Adjusting Credit Practice to Present-Day Conditions."

Imports of Tea and Coffee

The outstanding feature of the coffee and tea trade of the United States in 1923 was the marked increase in the imports of both coffee and tea, says the Department of Commerce. Imports of coffee into the United States increased 161,795,299 pounds during 1923 over 1922, and were higher than in any year of the past decade. The total amount of coffee imported in 1923 was 1,407,855,966 pounds, valued at $189,993,330. Imports of tea in 1923 showed an increase of 10,051,102 pounds, rising from 97,097,242 pounds, valued at $23,825,086, in 1922 to 107,148,344 pounds, valued at $29,928,722.

SALES MANAGEMENT

Get Your Product Before Public's Eye, Ring the Changes on 'Em, And Keep the Change!—Barnum An Example

By JAMES EDWARD HUNGERFORD

Written for Manufacturers News

IF you want to drive a nail—get a hammer!" is the pet expression of a practical California business man. There's a RIGHT way to do a thing, and a wrong way—which isn't a way at all! It's easy to sell things, if you have something to sell that people WANT. Sometimes they don't quite realize that they want them, and it's necessary to educate them, but once they discover they WANT them—the rest is simple!

The easiest way to educate them, is to present what you have to offer in the most attractive way. If it's a package of something, don't wrap it in mourning, and tie it with cords of crepe. If you do—it's YOUR funeral! Make the BEST of whatever you have to offer. If it appeals to the eye, it generally reaches the pocketbook, and gay trappings cost no more than gloomy ones, whether it applies to automobiles or chewing-gum wrappers.

You can't always appeal to a man through his stomach, as is generally believed. His EYES pass judgment, before his appetite is appealed to. He must SEE a thing, or hold a mental picture of something he has seen, before he wants it. You must get your goods under the PUBLIC EYE. That's why samples, show-windows and advertising have been found essential in any business. Either you must SHOW people what you have in concrete form, or suggest with word pictures what you have to sell, or they will pass you by—and up! "The eye is the window of the soul." Many "have eyes and see not." Your job is to MAKE 'EM SEE your product!

Barnum focused the public attention in every ingenious way he could invent or contrive. Once he had a man simply pick up a stone from the street, enter the door of his museum, go out the back way, lay the stone down, pick it up again, and repeat the performance, over and over again. Many noticed the man, and followed him—to SEE what he was up to, and paid admissions to Barnum's museum to find out! Barnum made millions. Nor was he a "faker," as is generally supposed. He always gave the public an EYE-FULL of wonders and mysteries, and things to THINK about.

And that's the SECRET. Get the PUBLIC EYE on your product or wares—and give 'em their money's worth. Make what's UNDER the wrapper as attractive as the wrapper—or what you advertise as attractive as the words that glowingly describe it. Barnum searched the world for new "ideas." He never allowed his "stunts" to become stale. Sometimes the public grows tired of the same wrapper, or color, or the same "line" of sales exploitation. You can't change the TRUTH about your goods, but you CAN change the manner of presenting, or stating it. A child wearies of the same toy, and rejects it for another toy of the same sort that for the moment seems more diverting. He blows a horn for NOISE, and beats a drum for the same reason.

We are all children—children of this world. We want, desire and *demand* change and diversion. Hence the world presents an infinite variety of things to SEE and DO. God made it that way for His children, and gave them the power to desire NEW things, and enjoy them. No two days of the year are exactly alike. What amuses today, bores us tomorrow. No two months are alike. No two cloud-effects, or sunsets, or sun-risings, are alike. No two PEOPLE are alike. CHANGE is what makes the world an INTERESTING place!

So find out what the world WANTS, and furnish it. Make it attractive, and KEEP striving to make it more, and still more, attractive. Attraction means "to attract"—to center the attention, or "catch the eye." Your brand and label and goods may be good, but sometimes it PAYS to array them in new dress, as you would array yourself in new clothing. You weary of the same color and shade and cut, nor would you wear a Winter suit in Summer, or a Spring suit in Winter. YOU crave change. So does the world—your brothers. *"Ring the changes on 'em!"* Change is simply another name for PROGRESS. Be progressive, and you'll "get the change."

The world would "swap" a funeral procession for a parade any day!

Wouldn't YOU?

Common Sense Efficiency

"It is not good sense to spend a thousand extra dollars a year unless that expenditure will cut costs or increase profits more than that. Yet I have seen men so enamored of what they thought to be efficiency that they spent on frills three times as much as they could possibly make," says William R. Basset, President of Miller, Franklin, Basset & Co., Inc.

"One for example, installed a mechanical conveyor requiring one man at each end, to do the material moving that had formerly been accomplished by one man with a hand truck.

"Another paid the clerks in his costs department $40,000 a year to gather figures that may have been interesting, but certainly were not worth what they cost. By changing the system to give him just what he needed, and no more, a matter of $35,000 a year was added to his profits.

"In another shop, expensive and highly specialized machines were installed because on long runs they were economical. The trouble was that in this shop there were no long runs, and the machines could not be kept sufficiently busy to show low costs. Cheaper and less 'efficient' machines on which several diverse operations could be performed would have been better.

"A shirt manufacturer found that his cutters were liberal, and for safety's sake, often made the tail of a shirt a quarter of an inch too long. He offered a bonus to his men to stop this waste, for he visioned a saving of thousands of yards of cloth a year. The saving materialized, but it was useless, for the length of cloth from which the shirts were cut was such that no individual piece of cloth saved was long enough to be used for anything.

"Great savings can be made in the usage of labor and material; but common sense efficiency dictates that the game be worth the candle."

Sales Managers In Merger

The National Association of Sales Managers has consolidated with the Sales Executives' Division of the American Management Association, according to an announcement by C. K. Woodbridge, President of The Dictaphone Corporation and President of the National Association of Sales Managers.

Link-Belt Gasoline Shovel

Link-Belt Company of Chicago has recently developed a shovel attachment for use in connection with its gasoline crawler crane. This shovel boom attachment is interchangeable and provides the crane with a far greater field of usefulness. Either attachment (shovel or crane boom) can be specified as original equipment, but however specified, the interchangeability of the booms makes the machine either a gasoline crawler shovel with a crane boom attachment or a gasoline crawler crane with a shovel attachment.

CONSTRUCTION

BOND

"The Paper of Known Substantial VALUE"

FIRST impressions do count and they mean just as much in the letters you write as in the interviews which your salesmen secure to sell your goods.

The first impression which any letter makes depends on the stationery on which it is written. For as you have frequently heard —"Your stationery is your business photograph."

You can secure, if you are willing to pay the price, impressive stationery which ***advertises*** its ***expensiveness*** and, theretofore, inevitably suggests extravagant methods, high prices and fat profits—or you can use CONSTRUCTION BOND, the Paper that makes Impressive Stationery at a USABLE PRICE.

Construction Bond is known to be less costly for its quality than other fine bond papers because it is marketed not through local jobbers a ***fraction of a ream*** or more at a time, to any printer or lithographer who will buy them, but ***direct*** to ***responsible*** printers and lithographers throughout the United States, in quantities of ***500 lbs. or more*** at a time.

Thus every sheet of Construction Bond goes into your business stationery ***minus*** the usual jobber's profit, ***minus*** his expenses of handling small lots, minus his losses on small and questionable accounts—only the expenses essential to perfect distribution and service are left.

The next time you order stationery be sure to specify Construction Bond, "The Paper that makes Impressive Stationery at a Usable Price."

AUTOMOBILE—AVIATION

American Gasoline Is Exported for Automobile Use in Foreign Lands—Volume Increased 5 Times in Decade

WHILE the American automobile is rapidly invading the foreign markets of the world, it is at the same time drawing its "food supply" from its native country, the United States, according to a survey made and figures compiled by the National City Bank of New York. These statistics show that the exportation of gasoline is now nearly five times as much as a decade ago. The total quantity of gasoline exported in 1913 was a little over 100,000,000 gallons and in 1923 was about 500,000,000 gallons; the value in 1913 was $17,000,000 and in 1923 approximately $75,000,000.

That this demand for our gasoline by the automobiles and flying machines of the foreign world is a permanent one is evidenced by the fact that our exports of gasoline are now much greater than in the biggest year of the war period when the requirements of the military operations in Europe greatly intensified the demand upon us as the world's chief producer of gasoline.

Even this big export of approximately 500,000,000 gallons in 1923 is a small quantity when compared with the figures of total production, since the recent census of manufactures shows the quantity produced in the United States in the calendar year 1921 as over 5,000,000,000 gallons, and this suggestion that we consume at home about nine-tenths of our product is in line with the recent statement that about nine-tenths of the world's automobiles are owned in the United States.

The 500,000,000 gallons of gasoline we export go to every part of the world. Official figures for 1921, the latest year in which gasoline was separately shown in the export record, shows shipments of gasoline to ninety different countries, colonies, and protectorates. And in all of these countries to which the gasoline is sent it finds American automobiles awaiting its arrival.

Studebaker Plans Stock Increase

Directors of the Studebaker Corporation have voted to call a special stockholders' meeting on April 1 to approve an increase of capital stock from $85,000,000 in $100-par shares to 2,500,000 shares of no par stock, and to distribute two and one-half shares of the new issue for each share of the present issue. This action, if ratified, will make the outstanding issue 1,875,000 shares, while 625,000 shares will be authorized held for future issue. Studebaker's present capitalization consists of $75,000,000 of common, all outstanding, and $15,000,000 of preferred, of which slightly less than $10,000,000 is outstanding.

Oakland Sets Sales Record

The Oakland Motor Car Company broke all previous Oakland sales records for a single month when its February sales exceeded those of the previous high month, June, 1919, by over 1,000 cars. The figures show a 300 per cent increase over February, 1923, and are more than 59 per cent greater than February, 1919, which was the previous record February for sales.

Red and White for Rio

Red and white are the colors to be kept exclusively by the City of Rio de Janeiro for its municipal automobiles, under terms of a recent Municipal Decree. All city ambulances are white and all fire department machines are red. No privately-owned red or white automobile will be given a 1924 license.

Prize for Aero Speed Contest

The Aero Club of France has announced that Commodore Louis D. Beaumont has donated the sum of 200,000 francs as a prize for an International Speed Contest, which will be known as the Commodore Louis D. Beaumont Cup.

Prizes to "Red Baby" Winners

Thirty-one $1,000 prizes have just been distributed by the International Harvester Company among its prize-winning "Red Baby" dealers for 1923. The contest was open to every dealer who owned and operated for six months or more at least one "Red Baby" motor truck, a 2,000-pound speed chassis with express body painted red. The $1,000 prize in each region went to the dealer who had the greatest increase in sales of all of the items in the fifty-four McCormick-Deering lines over his base.

Canada Likes U. S. Accessories

The Dominion of Canada, whose passenger car and truck demands are supplied almost entirely by American manufacturers, is also one of the best markets for American automotive accessories and equipment. In fact, the Canadian markets are so closely interlocked with those in the United States as to constitute more nearly a domestic than a foreign field, says the Department of State in a report from Montreal. The potential market in Canada is equivalent to the potential market in the United States except for these factors: (1) The Canadian customs tariff, which is fixed at "general" rates for imports from the United States; (2) competition by Canadian-made goods, and (3) relatively inferior purchasing power because of poorer business and industrial conditions.

International Races in Italy

The International Automobile race for the Floro Cup will be held in Italy on April 27, 1924. It will be followed on May 4 by a speed test of 390 kilometers over the circuit of Trapani, for which 50,000 lire in prizes, as well as cups and medals, will be given. On May 11, the Misena Cup Race is to be run over the circuit of Caltanissetta, 322 kilometers, for 25,000 lire in prizes. Several important French cars are expected to participate in the races.

Shanghai Speeding Up

The automotive business in Shanghai is good with dealers in medium-priced cars reported sold out on new models, says Commercial Attache Julean Arnold in a cable to the Department of Commerce. There is a fair sale of light trucks at cheap prices. Shanghai imports of automobiles, according to the customs statistics for 1923, reached a total of gold $1,093,000. The share of the United States in this trade was 58 per cent; the German share, 12 per cent; British, 12 per cent; and the French share 9 per cent.

General Motors Dividends

The Board of Directors of General Motors Corporation has declared for the first quarter of 1924 a dividend of 30 cents a share on the common stock, no par value, payable March 12 to stock of record Feb. 25, 1924, also quarterly dividends on 7 per cent debentures, $1.75 a share; 6 per cent debentures, $1.50 a share; and 6 per cent preferred, $1.50 a share, payable May 1, to stock of record April 7, 1924.

Motor Mail Service for "Sheiks"

The Government of Iraq (formerly Mesopotamia) has contracted with the Nairn Transport Co. (British), of Beirut and Haifa, to establish motor mail service between Haifa and Bagdad, according to a report to the Department of Commerce. This service will bring Bagdad into weekly communication with London, the transit requiring nine days.

Quality—vs—Quantity

ONE good Salesman will produce 50 times more than 50 cheap ones.
Based on this same ratio—one piece of good "Printed Salesmanship" will produce 50 times more than 50 cheap printed pieces. The "Why" of this is simple to understand—Manz Quality Printed Salesmanship has 4 powerful selling values—Attention—Interest—Desire and Action. Cheap printing doesn't even get—attention.

BUSINESS AND FINANCE

*"History and Origin of Investments"—Growth of Corporations Made Possible Development of United States

III

By EUGENE M. STEVENS
Vice-President, Illinois Merchants Trust Company, Chicago

THE history of the origin and the rise of corporations is of great interest, but it is too long to have more than a mention in a discussion at this time. Men found that they were unable to accomplish things alone which they could do with partners, and the partnership relation, combining the capital and the abilities of two or more persons, became prevalent and largely successful. The inevitable outcome of this development was the corporation, which is nothing more or less than, in practical effect, a partnership of many persons, including the few who are actively in the business and the many who furnish the capital for its conduct and who have confidence in their managing partners. Such corporations became recognized in the law to the extent that charters were granted to them by the various states, and in some cases—notably in railroads and public utilities, insurance companies and banks,—the state exercises a certain supervision over them. The ownership in such corporations is evidenced by certificates of stock representing the number of shares of such corporations held by the owner.

The growth of this feature of economic life has had a vast effect on our country and on the world's commerce. It has enabled great enterprises to be undertaken, such as the building of transcontinental railroads, the development of vast resources, which no one man or combination of a few men could properly finance. Such corporations, many of them, continuing to exist through their very form long after the original creators have passed away, have become so established in the confidence of the people through their belief in the stability of the enterprise and its management, that their stocks and their bonds have become recognized as safe investments, and into these securities vast amounts of accumulated capital of hundreds of thousands of small investors have been safely and wisely placed. A man with $100 may buy a share of the capital stock or acquire a loan from one of these corporations secured by a mortgage on its property, and while he may be earning his daily cash by the labor of his hands, his $100 is being managed for him by the ablest brains and under the soundest conditions that the country can furnish and he, as the owner of that small amount, has benefit of all this expert ability in the management of his $100, just the same as his neighbor who may have $1,000,000 in the same company. So, the corporation has not only been of tremendous benefit in making possible the accumulation of capital for the upbuilding of the resources of the country, but it has likewise been of untold benefit in the conserving of the savings of the people, under the management of men of the highest abilities and in proven enterprises.

The growth of corporations has had another effect—it has made possible unexampled opportunities for young men and there is no limit of achievement to which they may aspire, excepting the limit of their own endeavor and capabilities. It is very easy to employ all the men necessary for section work on a railroad. It is not hard to select from their number men who are capable of being section bosses. From the best of the section bosses there are always some who may satisfactorily fill positions of division superintendents. Of the division superintendents there may be one or two who are capable of filling the office of general superintendent, but when you are looking for a man capable of becoming the President of the great railroad, or General Manager, he is exceedingly difficult to find.

This is true in all great corporations and there is a constant and crying demand for men capable of filling the highest positions in these corporations and the greatest difficulty that an executive of such corporations has, is to find men of sufficient ability to fill the best positions in his organization. It is much more difficult to build an organization and to find the material for its leadership of men, than to build the plants and properties of the business. Almost any executive, if he were forced to the choice, would give up his plants and retain his organization, rather than the opposite. The old saying, "there is room at the top!" was never truer than it is today, and the only limitation to any young man, rich or poor, is the limitation of his own hard work coupled with his natural intelligence, ability and character. Some men are paid for what they know and other men are paid for what they do; few have the ability to create and direct and many have only the ability to carry out the instructions of others.

Adams Express Earnings

The Adams Express Company reports a net income of $914,838 for 1923, equal to $9.14 a share on $10,000,000 of capital stock, against $10.18 a share in 1922. Of the 1923 net, $500,000 was paid in dividends and $414,838 was transferred to profit and loss. Book value of the stock, as indicated by the profit and loss account, is $136 a share, compared with $130 at the close of 1922.

Chicago Mill & Lumber Sales

Sales of the Chicago Mill & Lumber Company in 1923 amounted to $13,533,171 as compared to $10,077,997 the preceding year, setting a new high record for the Company except in the post-war year of 1920, when sales mounted to $14,683,321. Actual volume of shipments in 1923 actually exceeded the 1920 record year, according to the annual statement of the Company. Earnings on common stock, after preferred dividends, amounted to $10 a share.

Lyon & Healy Had "Best Year"

Lyon & Healy, Inc., musical instruments, had the best year in the Company's history. Net sales were $8,260,313, an increase over 1922 of $585,445. Net profits, after all charges, were $502,901, equal to $21.38 a share on the 23,528 shares of preferred stock outstanding and, after preferred dividends, to $1.54 a share on the 223,710 shares of par $20 common stock. Preferred dividends in 1923 amounted to $157,800, leaving $345,101 to be carried to surplus and making a total surplus of $524,479.

00,000 Loan to Northwest Farmers Asked by Illinois Manufacturers' Assn.

IRECTORS of the Illinois Manufacturers' Association have issued an ap- l to the entire membership to loan 0,000 in aid of Northwestern farmers bankers.

Here is an opportunity for the manu- urers to give some substantial aid to farmers," said E. C. Heidrich, Jr., Pres- nt of the Association. "It will be carry- out the principle of co-operation which the outstanding feature of the Farmer- nufacturer Convention held under the pices of the Illinois Manufacturers' As- iation in January. It will be a great big riotic service to the entire country. The ney will be used to give immediate re- f to bankers in North Dakota and other eat states of the Northwest who have ended credit to temporarily financially barrassed farmers. The farmers of the rthwest are frugal and thrifty and hard rking. All they need is a helping hand r a short time to make the Northwest e of the most profitably productive agri- ltural centers of the country."

The circular sent to the 2,700 members the Association said in part:

"Will you each loan $1,000 to solvent nks of the Northwestern states on sound curity conservatively appraised to enable ese banks to continue, or in many cases, resume banking operations? President Coolidge recently called a meeting of large interests, including R. P. Lamont, President of the American Steel Foundries and Vice-President of the Illinois Manufacturers' Association; Alexander Legge, President of the International Harvester Company, one of the large member firms of the Illinois Manufacturers' Association; Ralph Van Vechten, Vice-President of the Continental and Commercial National Bank, and John Olson, Vice-President of the First National Bank of Chicago, to represent Illinois at a conference in Washington to urge relief for the Northwest. These men, together with representatives of financial and industrial interests from other parts of the country, pledged $10,000,000, which will be used as a basis for rediscounting through the War Finance Corporation and the Federal Reserve Banks, toward a total of $100,000,000 which will constitute adequate relief to the situation.

"Only one-fourth of the subscriptions will be called for promptly as the loans to the banks will not be made faster than careful, thorough investigation will permit.

"The Illinois Manufacturers' Association is asked to secure $100,000. Banks, railroads and many of the larger Chicago corporations among our members have already contributed $1,800,000. The management of these loans will be in the control of men of large interests who are contributing their time and efforts without pay because of their devotion to our country.

"REMEMBER THAT

"(1) Your board of directors have approved this support.

"(2) Only solvent banks will receive aid.

"(3) All collateral to the loans will be offered for rediscount to the War Finance Corporation and the Federal Reserve Banks, and, therefore, must be safe collateral.

"(4) All loans will bear interest.

"(5) Most capable management without cost.

"Even if you have no direct trade with these Northwestern states you recognize the inter-dependence of the elements of prosperity and will want to do your share."

Establishing Foreign Sales Agencies

In the past three years, the Central Trust Company, through its foreign trade division, has assisted its customers in the establishment of scores of foreign agencies, which have resulted in thousands of dollars' worth of business for those customers. We have a number of customers abroad, with whom we co-operate in all their purchases in this country and our recommendation of suppliers largely governs this business.

A connection with our Foreign Department will prove of value to you in the handling and development of your foreign business.

CENTRAL TRUST
COMPANY OF ILLINOIS
MONROE STREET NEAR LA SALLE

A Helpful Banking Service

OUR direct connections with 7500 banks in the United States and 6000 in foreign countries make it easy for manufacturers and merchants everywhere to avail themselves of the many facilities of this vast organization.

A manufacturer shipping goods can assure himself of expeditious and efficient service by dealing through a Continental and Commercial correspondent.

Cunard Changes Name of "Tyrrhenia" to "Lancastria"

The Cunard Line announces that the name of its newest turbine steamer has been changed from "Tyrrhenia" to "Lancastria," and that under this name she will sail from New York March 8.

The steamer is the newest of the line's 17,000-ton ships, is 550 feet long, 70 feet broad and accommodates 600 cabin and 1,200 third class passengers. She was originally built to carry first, second and third class passengers, and her conversion to a cabin ship gives her patrons exceptional accommodations at low rates.

The "Lancastria's" first voyage from New York will be to Cobh (Queenstown) and Liverpool on March 8. She will then be transferred to the Plymouth, Cherbourg and London service, sailing in conjunction with the "Berengaria," "Aquitania" and "Mauretania" in the Channel service.

A. T. & T. Co. Reports 1923 Its Biggest Financial Year

The biggest year—financially—in the history of the American Telephone & Telegraph Company was 1923, according to the annual just issued. The total income was $139,290,961, as compared with $122,807,719 in 1922. Net income for the year, therefore, was $81,692,181, against $66,170,428 in 1922.

This net income is equivalent to 11.35 per cent earned on the average amount of capital stock outstanding in 1923. The Company has been paying 9 per cent annual dividends on the stock.

American Telephone & Telegraph Company has more stockholders than any concern in the world, and its stock is more widely distributed than any other American corporation. There were 281,149 stockholders Dec. 31, 1923, an increase during the year of 32,224. There are more women stockholders than men, and the average holding of all is twenty-six shares.

Taxicabing by Aeroplane, Dickinson's Way of Travel

Taxicabing in an aeroplane to meet business engagements in various parts of the country is a reality. Long the dream of sky-men, it has remained for Charles Dickinson, President of the Aero Club of Illinois, to make it a reality, to set the fashion and probably establish a new American record. Here is what he did on Saturday, March 1, according to *The Chicago Daily News:*

"Called to Dayton, O., on business Saturday morning, Mr. Dickinson borrowed the swift air coupe recently designed by Elmer Partridge, a Chicago aviator. Partridge left Ashburn field at 8 A. M. with his passenger and landed in Dayton at 11:15. Mr. Dickinson's business had been attended to by 2 o'clock and at 5:20 the plane was back in Chicago again.

"Sunday morning a business associate at Lake Geneva wished a conference. The coupe was rolled out again, Partridge and Dickinson took off for Lake Geneva and at noon were back at the field, the conference over.

"A nonflying cab was waiting at the field. As the plane landed Dickinson jumped from the machine to the other and in a few minutes was aboard the Twentieth Century Limited on his way to New York.

"Partridge's plane is equipped with a heated inclosed cabin with seats for three. It is capable of eighty miles an hour."

Francis Beidler, Lumberman, Dead

Francis Beidler, well-known lumberman of the Middle West, died on March 4 at his Chicago home, 4736 Drexel Boulevard. Mr. Beidler, a member of one of the pioneer families of Chicago, was in his seventieth year, having been born in 1854. As a young man he was identified with the lumber interests of his father and uncle, and in 1873 he was one of the organizers of the South Branch Lumber Company which, twenty years later, was succeeded by Francis Beidler & Co. He was also interested in lumber concerns in New York, North Dakota and South Carolina. He is survived by his widow, a son, a daughter and three brothers.

Tires prices have been reduced generally throughout export markets during 1923, the Michelin Company usually initiating these reductions, says the Rubber Division of the Commerce Department.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

LMOST $130,000,000 was paid in Federal, state and municipal taxes by the tric light and power utilities of the ntry last year.

ther figures on the light and power intry, as set forth by M. H. Aylesworth, naging Director of the National Electric ht Association, show that 1,150,000 adional customers were added in 1923, nging the total to 13,356,000; that 2,),400 kilowatts were added to the generng capacity and that the output was inased to more than 57,000,000,000 kilott hours.

A total of $702,143,000 was spent last ır for additions to light and power sysns. The total investment of the industry w reaches the stupendous figure of $5,0,000,000. Last year 300,000 customers d employes bought stock, totaling $250,0,000.

Western Electric's Schedule

Western Electric Company's Chicago ant will produce 1,200,000 desk-stand pe telephones this year. The schedule lls for an output of 480 telephones an ur throughout 1924. Plans also call for 5,000 message registers this year, against 4,000 in 1923; 4,750,000 switchboard mps, against 3,199,000 last year, and 25,000 loading coils, against 147,000 in 23.

More Money for Phones

The Board of Directors of the Illinois ll Telephone Company has approved an penditure of $2,903,734 for new plant in e City of Chicago and $746,683 for Illiois, outside of Chicago, a total of $3,650,17. The total approved for this year is 3,915,060.

I. P. & L. to Buy Power

All the electric power developed by the ew hydro-electric station to be built on e Fox River at Dayton, Ill., four miles rom Ottawa, will be purchased by the linois Power & Light Corporation. Under e terms of the agreement the dam across he Fox River and the power plant must e completed by April 1, 1925.

Downer's Grove Sells Plant

Downer's Grove, a suburb of Chicago to he Southwest of the city, lying in DuPage County, has decided that municipal opertion of its electric generating plant is not conomical, and the citizens, at a special lection held recently, ordered the plant old to the Public Service Company of Northern Illinois. The Company will pay 75,000 for the main unit of the plant which will be abandoned while the distriution system will be rehabilitated at a cost of between $15,000 and $20,000. A omprehensive survey by engineers employed by the City Council of Downer's Grove convinced the Council and the citizens that money could be saved by the change.

Radio Tells Stockholders

Radio was used to advise the more than 1,000,000 stockholders and customers of the Commonwealth Edison Company and the Public Service Company of Northern Illinois of the results of operation for 1923. This method of reaching those who could not attend the official annual meeting was the first in history, it is said, in which a corporation has conducted an "auxiliary" stockholders' meeting at the same time as the regular one was in session. There are 34,250 Commonwealth Edison stockholders, 85 per cent of whom live in Chicago, and 690,000 customers, while the Public Service Company has 21,500 stockholders and 253,000 customers.

Hydro Plant in New South Wales

The first step in the development of hydro-electric energy in the Clarence River Valley, Northern New South Wales, is being taken under the direction of Armstrong, Whitworth & Co., Ltd., of London. The site of the power house is near the township of Nymboida, about 26 miles from Grafton, where the stream attains its greatest volume. The estimate of the capital cost of the work is £100,000. Current will be generated at the power house at 6,000 volts, and stepped up to 33,000 volts, for transmission to South Grafton and Ulmarra. The transmission line is being constructed to these centers with a capacity of 1,200 kilowatts, and at both places substations will be erected, from which electricity will be distributed throughout the towns and adjoining districts.

Electric Show in Australia

An electrical exhibition under the auspices of the Victoria Electrical Federation will be held in Melbourne, Australia, during September, 1924. It is planned to cover every phase of the electrical industry, showing actual working models of the various types of apparatus from toys to machinery, transport, lighting and other industrial equipment. Both wireless telegraphy and telephony will have prominent places in the exhibition.

Cost of Living in Canada

The index number of wholesale prices in Canada, compiled by the Dominion Bureau of Statistics, rose from 152 in 1922 to 153 in 1923. This index, says the Department of Commerce, is compiled on the basis of 238 commodities which are weighted according to their commercial importance.

Legal Opinions on Industrial Questions

BY COLIN C. H. FYFFE

General Counsel, Illinois Manufacturers' Association

QUESTION—

Can recovery be made from an electric power company for damages caused by power being shut off for an hour and fifteen minutes? The Company claims that it is not liable for this interruption of service because it was caused by the burning of a transformer supplying service to the correspondent.

ANSWER—

I have not a copy of the contract before me; but I am informed that all of the contracts of the Commonwealth Edison Company for furnishing power contain this provision:

> "The Company shall not be responsible in damages for any failure to supply electricity or for interruptions or reversal of the supply if such failure, interruption or reversal is without willful default or negligence on its part."

If the interruption of power was without willful default or negligence on the part of the Edison Company, you have no claim against it for damages.

QUESTION—

Can the Federal Trade Commission compel a manufacturer to sell to a consumer at the same price that it sells to jobbing distributors?

ANSWER—

In the case of *Mennen Company* v. *Federal Trade Commission, 288 Fed. 774,* decided by the Circuit Court of Appeals for the Second Circuit on March 13, 1923, an order of the Federal Trade Commission was reviewed. The Federal Trade Commission has held that the practice of the Mennen Company in selling to wholesalers at one price and retailers at another price was unfair competition in violation of the Clayton Act and had ordered the Company to cease and desist. The Circuit Court of Appeals reversed the order. The Court held that the Mennen Company had the right to refuse to sell to retailers at all, and if it chose to sell to them it had the right to fix the price at which it would sell and it was under no obligation to sell to them at the same price that it sold to wholesalers. There was no discrimination between different retailers or between wholesalers; all were treated on the same scale of prices. The situation outlined in your question involves the same principle.

QUESTION—

Our Company employs twenty salesmen who solicit business in the Middle West in their own cars. On most of these cars the Company holds chattel mortgages for a portion of their value. The Company carries property damage and liability insurance on each car so written as to cover both the driver or salesman and for itself. Would the Company be liable in case a salesman injures some one or damages property while driving his car in the performance of his duties?

ANSWER—

An employer is responsible for the torts of a servant done in the course of the employment. If the employe is acting in t furtherance of his master's business wit the scope of his authority, the employer i liable for any damage caused by the ne ligence of the employe.

A salesman is an employe and not a independent contractor because he is su ject to the control of his employer as t details of his work. The Company woul be liable for damages caused through th negligence of its salesmen in the runnin of an automobile in its service, althoug the automobile belongs to the salesman an though he is not instructed to use an auto mobile in his work.

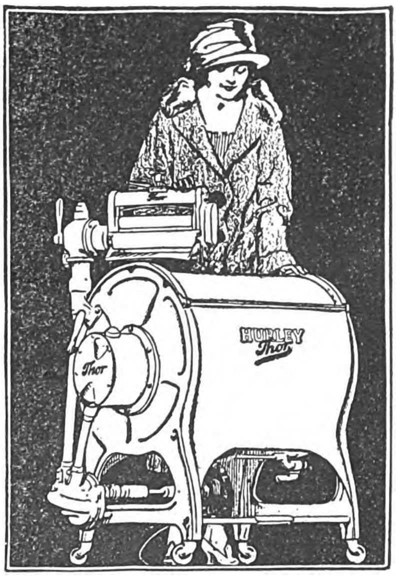
QUESTION—

Do salesmen of Illinois manufacturers who u cars of their firms have to procure chauffeu licenses under the Motor Vehicle Law of Illinois

ANSWER—

Section 27 of the Motor Vehicle Ac defines a chauffeur as "any person operat ing a motor vehicle as a mechanic or a employe or who directly or indirectly re ceives pay or any compensation whatso ever for any work or services in connectio with the operation of a motor vehicle o the transportation of passengers or mer chandise with a motor vehicle for hire o for pecuniary profit."

I am of the opinion that a salesman o a Company using a car owned by the Com pany in connection with his business o selling goods for his employer is not a chauffeur within the terms of this definition There are no cases in Illinois on this ques tion.



Clothes washed by Thor last longer

Thor laundered clothes wear longer and appear fresher. When washed in dubious surroundings and handled by uninterested strangers they do not receive the care which gives them long life. A Thor in the home saves you many dollars and your wife many hours. It keeps your clothing free from contact with other washings and does away with expensive replacements of lost garments. Thor launders for you quickly, economically and efficiently. See it in operation today—you'll understand its superiority.

Armour & Company Shows Big Sales Volume in 1923

Complete recovery from post-war deflation and depression is marked in the annual statement of Armour & Co., covering 1923. The report, issued by President F. Edson White, covers what was a particularly difficult period for the Company, the largest meat packing concern, as it included not only the merger with Morris & Co., but also a general financial reorganization, coupled with the floating of some $100,000,000 in securities.

President White calls attention to the fact that Armour & Co., in 1923, had sales amounting to over $800,000,000, more than the total formerly reached by both the Armour and Morris companies. The net profit of Armour & Co., on this tremendous volume of business was at the rate of 1¾ cents on each dollar of sales.

Gross income for 1923 was $38,583,217 and net profits, after charges, were $13,772,026. After payment of dividends there was a balance of $5,414,401 for the $100,033,700 common stock, which is owned chiefly by J. Ogden Armour and his family. This amount was added to surplus, which now stands at $45,790,803.

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

6,000,000 Cords of Wood for Paper

Just a little over 6,000,000 cords of wood, valued at over $90,000,000, were used by the paper manufacturers of the United States in 1923, according to Hugh P. Baker, Executive Secretary of the American Paper & Pulp Association. Of that amount 1,400,000 cords were imported from Canada. This wood produced about 7,198,000 tons of paper of all grades. The paper industry uses approximately 4 per cent of the annual wood cut of the country.

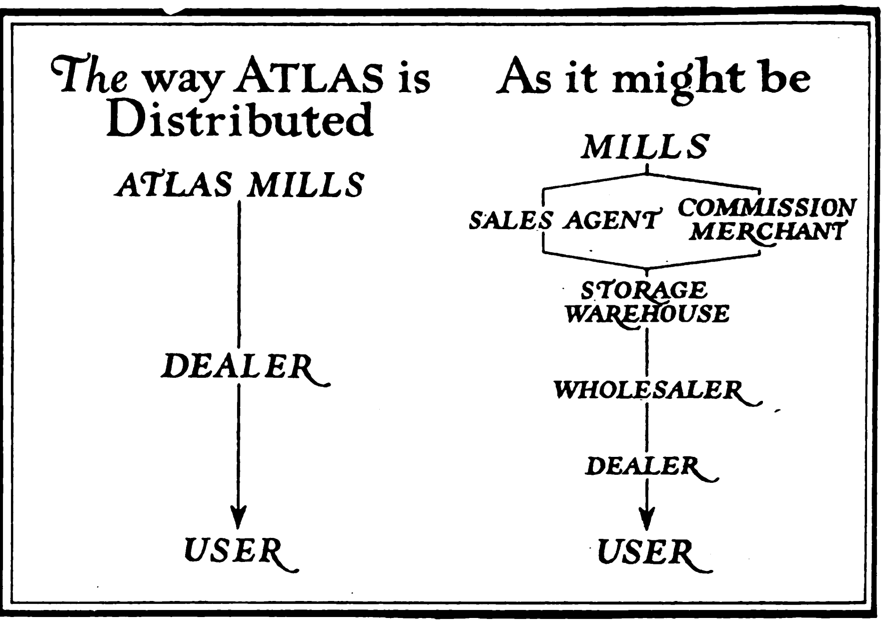
DISTRIBUTION

Distribution of Atlas Portland Cement is direct and economical through close co-operation of efficient local dealers.

A straight line is the cheapest distance between two points



ATLAS DISTRIBUTION
Insures Building Economy

THE cheapest of all products undergoing a complete manufacturing process is made available for any type of construction in any place through simplified economical distribution to the user.

BETWEEN the Atlas plants and the user there is but one distributor—the building material dealer—and the directness of this marketing is economically sound, for it serves to bring Atlas to the buying public cheaper than any other method that has been devised.

THE Atlas dealer with his warehouse and yard storage safeguards building operations through an ample supply of materials; with his trucks and general facilities he can make prompt emergency deliveries; and back of the Atlas dealer is the Atlas reserve storage capacity, greater than the output of the entire nation twenty years ago.

THUS, the one building material having the widest variety of uses, making construction rapid because of its ease in handling, and providing fire-safety and permanence to any building, is brought to the user a few bags or thousands of bags at a time, through a distribution method that sustains building economy.

Ask your dealer for Atlas Building Helps

THROUGH its dealers, Atlas supplies free books on concrete construction, written by Atlas Engineers who are recognized nationally as authorities. You are also invited to consult these Engineers without charge for advice on any building problem.

IF the dealer can't supply the book you want, write our nearest office.

WHEREVER YOU GET IT
SMOKING TOBACCO

Now 12¢

Just two things have made it possible for us to give this 20% reduction on Tuxedo:

1. **A reduction in the cost of Kentucky Burley tobacco and in package materials, as well.**
2. **The consolidation of three of our big plants into one. (Mr. Ford may not be in the tobacco business but he is right about consolidation.)**

This gives us a chance to pass an advantage along to all our friends; to share a good thing.

You know that it is the desire and policy of The American Tobacco Co. to extend to its customers the maximum of service.

Reducing the price of a great favorite like Tuxedo—the moment it's possible—is our idea of delivering this service.

So now your customers are getting the familiar tin of Tuxedo tobacco at 12 cents instead of 15 cents.

Aid for Northwest Banks

THE Illinois Manufacturers' Association is making a strong appeal to its members to loan $100,000—well-secured—to aid solvent bankers of the Northwestern States. This will be their share of $2,000,000 loaned by Illinois' business men. The loan is to be secured by bonds issued by the Agricultural Securities Corporation, the interest rate to be governed by income.

Some of the strongest financial interests in the country are back of the loan, including the War Finance Corporation and the Federal Reserve Bank. The enterprise is a worthy one, perfectly sound and will aid business.

Cost-Plus Corn

THE importance of farm cost accounting was stressed at the Farmer-Manufacturer Convention held in Chicago in January, under auspices of the Illinois Manufacturers' Association. Manufacturers for many years have realized the importance of basing their selling prices upon an accurate knowledge of the cost of producing their commodities. The Illinois Manufacturers' Costs Association has held monthly meetings devoted to factory economics and issued a great many reports on the subject.

Too many of the farmers in the United States have never taken into consideration the cost of producing their corn, wheat, oats and other products. No wonder they are poor. No wonder they are unable to pay their taxes. No wonder they have to work long hours without receiving just compensation.

There are indications that American farmers in the near future are going to pay just as much attention to the cost of producing as the manufacturers.

Paul B. Talbot of Des Moines, Iowa, Publisher of the *Iowa Farmer* and the *Corn Belt Farmer*, is preaching the doctrine of costs, and his missionary work has been remarkably effective. Mr. Talbot, at the Farmer-Manufacturer Convention held in Chicago, in an address on "Helping Farmers Get Cost of Production," emphasized the need of more accurate knowledge of costs on the farms. After going home from the convention he started a movement to interest the farmers of Iowa in the subject. He succeeded beyond his most optimistic anticipations. The first meeting was held in Des Moines, and several hundred farmers were told that the cost of producing corn exceeded $1 a bushel. Some of them were aware of the fact, because they had given Mr. Talbot figures indicating that the cost ranged all the way from 50 cents to $1.50 a bushel, but most of the farmers who attended this meeting learned for the first time that they had never taken into consideration such items as labor expense, interest on their investment (including the cost of their land), depreciation of farm machinery, cost of fertilizers or their equivalent necessary to keep the farm in satisfactory productive condition, taxes, marketing expense and the numerous other items which are familiar to every manufacturer.

Mr. Talbot addressed his second meeting in Kankakee a few days ago. Over 800 farmers were present, coming from five states in the Corn Belt. They were tremendously interested and impressed with what he said about cost keeping on farms.

It was not difficult to convince the farmers that they did not know what their costs were, nor was it difficult to prove to them that they were not getting costs. The hopeful result of the meeting lay in the fact that a definite plan was presented and approved whereby the corn growers can establish a base price for corn which shall represent the cost of production plus a reasonable profit, below which price they are determined not to sell.

The farmers of Iowa, Illinois and other states are on the right track. They are simply following the example of the manufacturers. As one of the farmers remarked at the Kankakee meeting, it is the first ray of light that has brightened a gloomy sky since 1920.

Who Paid for the Panama Canal?

WHEN the Panama Canal was built under the direction of the United States Government, the whole United States was called upon to foot the bill through a Federal tax levy to meet the Canal bond issue. The Central West, like all other sections of the country, contributed its full proportion.

Now comes one W. H. Chandler, representing the Boston Chamber of Commerce and the Northeast Traffic League, and makes the astounding statement before the Interstate Commerce Commission that "the East, which admittedly benefits most from the Panama Canal, is entitled to this benefit *because it contributed most to the cost of the Canal.*"

Where does Mr. Chandler get that idea?

In fairness to all other parts of the country the Interstate Commerce Commission should challenge that statement; it should require of Mr. Chandler his proof that the Eastern section of this country "contributed more to the cost of the Canal" than other sections—and, therefore, is entitled to preferential commercial rates not accorded shippers in other parts of the nation.

Taxpayers in the Middle West would like to know more from Mr. Chandler about the financing of those Canal bonds.

Refunding Income Taxes

THERE must be something radically wrong with the collection of the Federal income tax when the Government finds it necessary to refund to 263,320 taxpayers such a stupendous total as $123,992,820.94 in 1923. This, however, is the official statement of the Treasury Department to the Ways and Means Committee of the National House of Representatives. These overpayments, covering a period of several years, were made on account of "illegal and erroneously collected taxes," says the report.

When it comes to the collection of these taxes the Government is fast enough; it gives neither time nor opportunity for investigation of protests against "illegal" or "erroneous" assessments, but demands cash on the spot. Then, when convenient, the Government investigates; and again, when convenient, the Government refunds.

This is a huge sum of money to be withdrawn from the channels of business and commerce for a period of years. It is a heavy charge to industry, and is another of those "intangibles" which goes toward holding up the cost of living.

Some better and fairer method should be found to handle this unnecessary brake on the finances of industry.

Compensation for Occupational Diseases

SINCE occupational diseases have been placed under provisions of the Illinois Workmen's Compensation Act, the importance of physical examinations of workmen has been impressed upon employers.

The Division of Factory Inspection of the Illinois Department of Labor reports that preventive measures are more rigidly and widely used by the employers than was the case when factories were merely under police power of the Factory Inspection Department. Furthermore, employes are certain of immediate benefits, employers escape expensive court procedures with large sums for damages in some cases, and the public is benefited by actual reduction in sicknesses, as health measures are more generally adopted.

At present, diseases are compensated in eight states: California, Connecticut, Illinois, Massachusetts, Minnesota, New York, Ohio and Wisconsin.

This was one of the constructive measures adopted by the 1923 Illinois General Assembly upon which employers and employes were able to agree.

hall U. S. Shut Out All Immigrants?

Nation Justified in Adopting Progressive Restrictions As Saturation Point Approaches—Tentative Program

By MAGNUS W. ALEXANDER
Managing Director, National Industrial Conference Board

THE immigration problem today is more than a debatable, economic, sociological or political question. It is essentially a race question—a question of kind of nation and citizenship which desire to rear in the United States.

'rom a practical viewpoint, the econom- ıspect of our national life is of primary ›ortance. Immigrants have been at- cted to the United States in the past :ause of the better wages paid, the more isfactory conditions of work that pre- l, and because with the opportunity of better economic status than in the old rld were opportunities for a broader e, free from the restrictions of autocracy, ss, binding tradition and drowsy con- vatism. The magnet which has drawn em here has been "work." In many ars over a million have come in the ace of twelve months, and it is undoubt- ly true that if the gates were wide open d the foreign exchange situation in some untries were not so bad as it is, prob- ly more than a million persons a year ›uld be coming in at the present time.

Obviously the admission of immigrants so entails a corresponding responsibility. nation that is at work under satisfactory nditions is, on the whole, a happy nation.

We do not want to admit more immi- ants than we can give work to. How any, however, can be assimilated in this ay is not known. It is one of the first estions that should be made the subject Federal investigation, since it is really e crux of the economic aspect of the ımigration problem.

The statement would seem warranted, ıat for her justified protection the United :ates must progressively restrict immi- ration as the saturation point of immi- ration absorption is approached and the vailable supply of the country's resources, er capita of population, diminishes. This eriod will naturally be projected further ıto the future as new inventions are made, rocesses of production and distribution ecome more efficient, and additional ma- erial resources are discovered. The ex- eptional richness of the United States in ıaterial resources and her present relation- hip to European countries would justify liberal attitude in respect to immigra- ion, but the time will come when, as a natter of self-preservation, the United States must be reserved essentially for the enefit of its own residents.

Program for the Future

Whatever changed or new immigration egislation may become necessary should ›e enacted, therefore, in harmony with a oroadly conceived, scientifically and prac- tically justified program, based on ascertained facts and their rightful interpretation, even though expediency may at times dictate some deviation from it. Predicated on these considerations, the following immigration program may meet the immediate situation and prepare adequately for future needs:

FIRST—Extension of the present Per Centum Limit Act, expiring by statutory limitation on June 30, 1924, for a few years; with certain administrative changes, however, to remove obvious injustice and facilitate the operation of the Act. The following are suggested for consideration:

(a) Control over quotas for the various nationality groups by American consular officers in all foreign countries, operating under instructions of the Federal Government and working in close co-operation with immigrants and steamship companies to prevent, as far as possible, the arrival of aliens in the United States in excess of quotas.

(b) Maximum monthly quota for each nationality of 10 per cent, instead of the present 20 per cent of the annual quota, except insofar as any unused portion of such monthly quota may be admitted by any succeeding month during the fiscal year.

(c) Admission of the wife and minor children arriving with an admissible alien, or subsequently joining him in the United States, without being charged to quotas if otherwise admissible, in order that family unity may be promoted.

(d) Aliens arriving after their nationality quotas for the month have been exhausted and refused entry only because of exhaustion of such quotas, to be admissible under a new monthly quota without being returned to the ports of embarkation.

(e) Admissibility of resident aliens leaving the United States for a temporary visit abroad, without being charged to quotas, if their return occurs within a year and they are otherwise admissible under the laws.

(f) Admissibility outside of nationality quotas of certain professional and special groups now enumerated in the law, but not at first counted against the quotas and then admitted ouside of exhausted nationality quotas; and admission also of their wives and minor children, if otherwise admissible, without being charged to quotas.

What Immigration Plan Should U. S. Adopt?

IMMIGRATION is one of the major problems before the people of the United States. Some satisfactory solution of the question is being sought by the leaders of the nation—political, sociological, economic.

"Restricted" immigration has apparently gained a strong following throughout the country; but the question here is, how much to "restrict."

Mr. Alexander, who delivered an address before the recent Farmer-Manufacturer Convention under the auspices of the Illinois Manufacturers' Association, of which the accompanying is an abstract, has, as Mr. E. C. Heidrich, Jr., said in introducing him, "not only the American view on this subject, but also the advantage of the European view, for he started his business career in Central Europe."

The proposal of the continuance of the present Per Centum Limit Act for a limited period can be justified on the ground that this Act has been in effect only a little over two years and so far has not revealed any serious detrimental effect on our national life. If the present Per Centum Limit Act has proved defective as to certain administrative features, these defects can readily be removed without making structural changes which obviously should not be made until more is definitely known about the principal factors involved in the immigration problem.

Commission Named by President

SECOND—Appointment of an Advisory Commission by the President of the United States, under a resolution of Congress, to report through him to Congress within a limited time in respect to:

(a) Immigration and emigration in the light of present domestic and world conditions.

(b) Requirements of industry, commerce and transportation for labor forces and, insofar as the native supply is inadequate, for immigrants generally and for special groups of immigrants in particular.

(c) Economic and social assimilability of foreign racial groups.

(d) Effect of mixture of races upon the virility and social progress of our nation.

(e) Practical methods of selecting, distributing and assimilating immigrants.

(f) Other major factors in the immigration problem.

(g) Suggestions for an adequate, scientific and practical program of immigration based on an analysis of the aims and ideals of our national life.

A study of the immigration problem, as proposed, is so much the more necessary because, since the last comprehensive survey made by the United States Immigration Commission of 1907 world conditions and, by reaction, domestic conditions, have vitally changed, requiring a new international relationship and a new conception of mutual social and economic obligations. Not only the needs of the United States but also the extent to which these needs can be met, because of new emigration policies adopted by foreign countries since the war, must be considered.

I believe that industrial leaders will support such a program for, while protecting the social structure, it will not unduly disturb industrial operation at a time when so many other factors, domestic and international, already are threatening to jar the industrial machinery. Moreover, industrial leaders will feel that the comprehensive knowledge sought under the proposed inquiry will result in the promulgation of a broad national immigration policy and a man-made law in harmony with economic law, but also responsive to practical considerations of our social and economic system.

A. R. Erskine Will Address Costs Assn. Annual Meet

Two exceptionally interesting programs have been arranged for the next meetings of the Illinois Manufacturers' Costs Association. The first one will be the luncheon-meeting on March 18 at the Hotel LaSalle, which will be addressed by Ray Vance, President of the Brookmire Economic Service, Inc., of New York City, on "What Lies Ahead of Us in Business." Mr. Vance, through his connection with one of the best known statistical, financial and investigating organizations in the United States, is well qualified to talk about present business conditions and what his idea is of the future.

A. R. Erskine, President of the Studebaker Corporation, South Bend, Ind., will be the speaker at the annual meeting of the Costs Association to be held at the Hotel LaSalle on April 29. His subject will be "Importance of Accounting to Management." This meeting should be particularly interesting to executives of manufacturing plants.

John M. Roach, Well-Known Traction Leader, Is Dead

John M. Roach, one of the foremost traction leaders of the world, died recently at Fort Myers, Florida. For fifty years he was connected with Chicago's street railway system, and for a quarter of a century was one of its leaders.

The rise of Mr. Roach to power in the traction world was romantic. He was born at Lowell, O., Jan. 30, 1851, and after his schooling came West. In 1869 he got the "gold fever" and went into the hills of the Northwest, but failing to find a paying mine, he returned to Chicago in 1873 and entered the employ of the street car company as a conductor. From this point his rise was meteoric. This job lasted less than a year, when he was promoted to cashier at the barns; seven years later he was Purchasing Agent, then in 1887 Assistant Superintendent. In 1890 he was Superintendent of all lines controlled by Charles T. Yerkes, and three years later was Second Vice-President. When the Union Traction Company was formed in 1899 he was made General Manager and in 1900 became President. On the organization of the Chicago Railways Company he was elected its President, resigning in 1913 in favor of Henry A. Blair. But Mr. Roach kept his hand on traction affairs by becoming a member of the Board of Operation and Vice-President of that Company, which position he held at the time of his death.

Mr. Roach had suffered from heart disease for several years, and this ailment caused his death.

Women Sensitive on Price Question, Says Henry Pope, Business Optimist

HENRY POPE of the Bear Brand Hosiery Company is a thorough, dyed-in-the wool optimist about the business future. He is one of the new Directors of the Illinois Manufacturers' Association. Evidencing his confidence in the outlook for 1924, Mr. Pope recently announced to his wholesale trade that all grades and styles of hosiery manufactured at the Company's six mills in the Middle West would be available to them the first of the year, which was much earlier than usual.

"I have no patience," he said, "with business men who have been accustomed to look upon a presidential election year as unfavorable to business. We hear less and less of that kind of talk every four years. Now it is confined mostly to a class which always must have something to worry about. With such people, if it were not a presidential year, it would be something else."

In discussing the prospects for the hosiery trade in 1924, Mr. Pope expressed the belief that this year will probably afford a smaller margin of profit to the manufacturer owing to the increased cost of raw materials and other production factors. The consumer however, will not pay any advance until compelled by necessity, he said.

One can readily account for the position Mr. Pope holds in the hosiery trade when his personal interest in the wholesaler and retailer is fully appreciated. Just now retailers pretty generally are suffering a growing competition of house-to-house canvassing. Mr. Pope is telling the retailer that the solution of the problem is clearly up to the salesman behind the counter. He says:

"Women are very sensitive on the question of prices and frequently will go beyond their purse, or not buy at all, rather than to appear 'cheap.'

"The habit of salesmen is to show them the highest priced goods. In the privacy of their own homes they are shown medium priced goods by the canvasser, without the urging of sales people to go higher. The people behind the counter should be most carefully instructed to show women customers the medium and low priced goods first, rather than try to force high priced goods upon them, which they may not want."

Henry Pope

"A Star for a Nite" Frolic by Donnelley Employes

Officials, executives and employes of R. R. Donnelley & Sons Company, the Reuben H. Donnelley Corporation and the Chicago Electrotype Foundry, constituting The Lakeside Press, were entertained at the Aryan Grotto last Friday and Saturday evening, March 7 and 8, with a musical comedy, "A Star For A Nite," written by George Alexander Imlach and staged and directed by George Bainbridge. The program was under the auspices of the Lakeside Press Employes Association, and the entire cast of characters was made up of Lakeside Press employes.

W. F. Leonhardt was Chairman of the Entertainment Committee.

The show was well given, well costumed, and was full of catchy songs, pretty girls, brave men and plenty of jazz music.

The Lakeside Press is one of the older printing plants in Chicago, having been established by Robert R. Donnelley before the fire of '71. Its Service Department, in which the client's problems of marketing are studied by a large research staff and in which complete advertising campaigns are laid out, is one of the oldest departments in the organization.

H. H. Marshall Now a "V. P."

Herbert H. Marshall, who for fifteen years has been associated with the direct mail firm of Buckley, Dement & Co., Chicago, was recently advanced to Vice-President and elected a member of the firm. Mr. Marshall has served in order as Department Manager, Production Manager, Service Director and City Sales Manager. He will continue to direct the city sales work for Buckley, Dement & Co.

Exact Inventory a Prime Necessity*

Important Guide for Credits, Sales and Production; Don't Try to Fool the Government, Suggests Speaker

By **WALTER M. LeCLEAR**
Ernest Reckitt & Co., Chicago,
and
President, Illinois Society of
Certified Public Accountants

III

AMONG the "don'ts" I might mention these few: Don't make up your mind beforehand what your inventory ought to be, and then try to rk to that figure; don't try to fool the vernment or someone else into believ- your inventory to be smaller than it lly is; on the other hand, don't try to l some prospective purchaser into beving your inventory to be greater than really is—your attempt would probably discovered in either case.

No doubt some of you have been connted with the question of inventorying -products. It is outside the realm of my bject to discuss cost accounting, but I ll at least be permitted to remind ourlves that scarcely any cost systems underxe to fix the cost of producing by-prodts. The cost system fixes the cost of oducing the principal product of a plant, id usually whatever is derived from the sposition of the by-products is considered so much of a reduction of what would herwise be the cost of the principal prodt. Inasmuch as the producer, the taxayer, has no means, therefore, of knowing e cost of the by-products in his inventory, naturally is unable to use cost. Manucturers usually value by-products at an nount intended to represent their market alue less the estimated cost of placing the y-product in the hands of the purchaser. number of instances of this kind have me to my attention, in connection with ses that have been investigated by aparently highly competent Revenue Agents ithout any adjustment whatever to the inentories, which has led me to believe that e method is acceptable to the Bureau.

To my mind there is no published ruling r regulation regarding methods of valuing y-products for inventory purposes.

Consistency Proper Policy:

Here again it seems that all that the Bureau expects is that the taxpayer be consistent in his practice, and that he make an onest effort to value his inventory in such way as will most nearly reflect his true et income.

Returnable Containers:

The matter of returnable containers is ne that will be of interest to some of you. This may be, and it may not be, a matter that properly comes under the category of inventories. It depends upon how you handle the containers in your accounting records.

If you adopt the plan of treating them as a depreciable asset upon which you write off a certain percentage each year for wear and tear, breakage and loss, which percentage is based upon what experience has shown to be the average life to be expected of these containers, then they do not constitute a part of your inventory. However, a common method of accounting for containers is by the use of inventories, and for that reason I feel that it would be proper to say just a few words in that connection.

Courtesy, Golfers Magazine

1st Caddie: "What makes you think that new guy is a bookkeeper?"

2nd Caddie. "'Cause when he got through playin' I saw him try to put his club behind his ear."

Examples of Containers:

The question of properly accounting for returnable containers is one that causes difficulty to manufacturers in many different lines. The term "containers" covers numerous classes of articles, among them I might mention steel drums, carboys, barrels, kegs, casks, bottles, boxes, baskets, bags, crates, cracker tins, cable reels, and others, any one of which may be necessary for use in the disposition of a manufacturing company's product, but which in itself is not the article in which that company primarily deals. In some cases the selling price of a company's product is made to cover the container, in which case no accounting on that score is necessary; but wherever there is an understanding that the container is to be returned, difficulties at once arise.

Profits on Containers:

A common difficulty in this connection is brought about by the fact that in many instances the manufacturer charges the customer with the container at the same time as he charges the customer with the merchandise in the container, and at a price in excess of the cost of the container to the manufacturer. Many customers, for one reason or another, will keep the container, and sooner or later be required to pay for it, and this results in a profit to the manufacturer. If such receipts are simply credited to the container account and no other adjustments or entries are made except to charge the account with purchases, it can readily be seen that sooner or later this account will in no way reflect the actual facts as to the containers.

Account to be Adjusted Regularly:

Here adjustment must be made, bringing this profit into the profit and loss or surplus account, and the most accurate way to make the adjustment is by means of an actual inventory. I have a case in mind that came to my attention some time ago, wherein containers constituted a very important item in a certain manufacturing company's operations. In this particular case the containers were billed to the customer at a profit to the manufacturer, and corresponding credit was entered to the container account. No adjustment had been made in the account for five or six years. When the company's attention was called to the matter, and adequate adjustment had been made, it was found that a total profit of approximately $250,000 had accumulated. Unfortunately for the company, a portion of this profit had accrued during the high tax years, and the Bureau of Internal Revenue insisted that the total profit from this source be pro-rated proportionately over the period that had elapsed since the last adjustment had been made.

Bureau's Method of Allocation:

In this case the allocation to the various years involved was made on the basis of the number of containers shipped each year, which was probably as fair an allocation as could be made under the circumstances. An inventory at the end of each year would have determined the annual profit quite accurately, and would have enabled the company to file accurate income tax returns and eliminate the necessity of later paying additional taxes for that item.

That particular concern probably felt good, to think that they had the use of the

---

(*Last of three installments of address before the 4th Tax Congress, Illinois Manufacturers' Costs Association.

additional tax money, until the time the Revenue Agent caught them.

The best practice with respect to returnable containers seems to be to use the inventory method in the case of small, light articles, such as bottles, baskets, bags, crates and cracker tins, but to consider as fixed assets and apply depreciation at a regular rate to the heavier articles that come under the classification of containers, such as steel drums, carboys, tanks, barrels, casks and cable reels. Where the inventory method is used, you are not permitted, of course, to apply depreciation, as I have pointed out to you. The Bureau of Internal Revenue will permit the deduction of depreciation on the containers in case they are treated as fixed assets, the rate of depreciation to be consistent, of course, with what experience has shown to be reasonable and proper.

Inventory Method Not to be Confused with Depreciation:

The question will at once occur as to whether the use of the inventory method does not itself, in effect, reflect the writing off of depreciation. When you consider the matter more thoroughly, however, you will see there is a distinction here. The fact is that, in practically every instance, a light container that has been used but is still serviceable is worth as much to the manufacturer as if it were new. Take for instance a milk bottle or a cracker tin; if either of these is not as serviceable as if it were new, it is of no use whatever, and will not be taken into the inventory at any price. In the case of such containers as do become less serviceable after once being used, but still continue to be of value to the manufacturer, the diminution in value here should be considered in the light of a loss of value by reason of the fact that the container is no longer new, but is now second-hand, and its value for inventory purposes will be the same whether it has been in use one year or several years, which readily distinguishes the diminution in value from ordinary depreciation. The moment you undertake to apply depreciation, you run counter to the income tax regulations.

Methods of Verifying Inventories:

While speaking of inventory methods that are or are not acceptable to the Bureau of Internal Revenue, I feel it would not be amiss to mention to you some of the methods used by auditors in testing the accuracy of inventories. A knowledge of these may be of assistance to a taxpayer in putting his inventory records in such shape as to be most apt to meet the approval of the examining officer. Some of the more important points to bear in mind are these:

(a) A competent examiner will want to see the original inventory sheets. Inability to produce these will at once arouse suspicion of their intentional misplacement.

(b) He will make tests of the extensions and footings, and a comparison of the total reflected by the original sheets with the amount shown on the certificate of inventory that is required to be submitted with the income tax return, and will ask for a satisfactory explanation of any difference that may appear.

(c) He may make inquiries into the reliability of those who took or supervised the taking of the inventory, and of those who supplied the unit prices. He will also make test checks of the prices used. If perpetual inventories are kept, he will make test comparisons of the perpetual inventory with the physical inventory as listed.

(d) He will make certain that goods in transit, either inward or outward, are properly treated; likewise with goods on consignment, either in or out.

(e) He will make comparisons with former inventories, having in mind the average rate of purchase or production, and the average rate of sale or consumption.

(f) He will make the "gross profit test."

Degree of Verification Relative:

The degree to which a competent examiner will apply these tests which I have just mentioned, as well as others, perhaps of less importance, will depend upon the importance of the inventory in the particular case under review, and will also depend largely upon the impression which he has gained in general of the reliability of the records he is investigating.

Inventory Loss:

In connection with the subject of inventories, I want to recall to your minds a relief feature of the 1918 Act which applied only to the closing inventory of the taxable year 1918, but which, nevertheless, has its counterpart in the 1921 Act, and that was the provision for loss on inventory. On account of the material price reductions Congress expected would occur immediately after the termination of the World War—perhaps I would be more accurate if I said "signing of the Armistice" instead of "termination of the war," —Congress provided that, under certain conditions, a deduction was permitted in the 1918 return for a loss sustained after the close of the year through a material reduction of the value of the inventory or from the payment of rebates in 1919 upon sales made during 1918. As I stated before, this relief provision applied only to the closing inventory of the taxable year 1918.

In other words, at the end of 1919, business in general was in a chaotic state; a great many concerns were over-inventoried, some were under-inventoried, and all sorts of conditions existed. The Department took that into consideration, and practically put the matter up to each individual taxpayer, and said, "Go ahead and do anything that is honest, and we will consent to it," but that was the only year in which that condition really has applied.

The 1918 Act has also contained the "net loss provision" which could be applied in a decidedly limited number of cases. The 1921 Act has a new net loss provision which is broad enough to give a taxpayer ample recompense in the succeeding year or two years for any loss he may sustain by reason of a reduction, whether substantial or small, that may occur in the value of his inventories after the close of his year, provided only that he operates at a profit in the immdiately succeeding years sufficient to offset the loss he sustained.

I take it you are more or less fami with the net loss provision of the 1 Act, which provides that in case of a n loss in any taxable year beginning a 1921, such loss with certain restric and with certain adjustments can be carried forward for a maximum of two yea In other words, if that net loss is not entirely absorbed in the following year, y may carry the balance over to the seco year thereafter. Now, this is somewh along the lines of the net loss provisi of the 1918 Act, with this exception, th the net loss provision of the 1918 Ac rather acts the reverse to that; that is t say, if you had a profit in 1918, you coul consolidate the subsequent year with yo 1918 profit, thus throwing your loss bac against a profit, while under the 1921 Ac it is a case of throwing the loss forwar against a profit.

Other Purposes of Inventories:

I have spoken in considerable deta about the methods that may properly b used to determine the operating profi and net worth accurately, especially emphasizing what is, and what is not, accep able to the Commissioner of Internal Revenue, and have attempted to impress upo you the necessity for correct inventori for income tax purposes. In addition t their importance in connection with incom taxes, you need accurate inventories fo credit purposes; you need them to guid you in your production plans; you nee them in planning your selling campaigns you need them for local tax purposes; fo valuing stock in the case of sale or in connection with inheritance or estate taxes and you need them for many other purposes, including the protection against los through inadequate insurance.

In conclusion, let me repeat: Be consistent in your inventory practices, and le your Sunday conscience be your guide.

1,660,000 Tourists Visited Colorado's Forests in 1923

Colorado's fifteen national forests were a playground for the world during the Summer season of 1923, when 1,660,00 tourists, representing every state in the Union and many foreign countries, visited the forests, enjoyed the scenery and the outdoor recreations which they afford.

Visitors to the national forests in Colorado exceeded those of 1922 by 110,000 indicating the growing popularity of the forests as a Summer playground for the nation's tourists.

Of the 1,660,000 tourists who visited the national forests during the 1923 vacation season, 1,200,000 were motorists.

British Consulate Moves

Offices of the British Consulate-General which heretofore have been at 86 East Randolph Street, Chicago, have been moved to Rooms 911-914, London Guarantee & Accident Building, 360 North Michigan Avenue, according to an official announcement issued by the Consul General.

ax Cut Fight Is Renewed In Senate

President Coolidge Stands Squarely on Mellon Plan; House Committee Squabble Over Proposed Bonus Bill

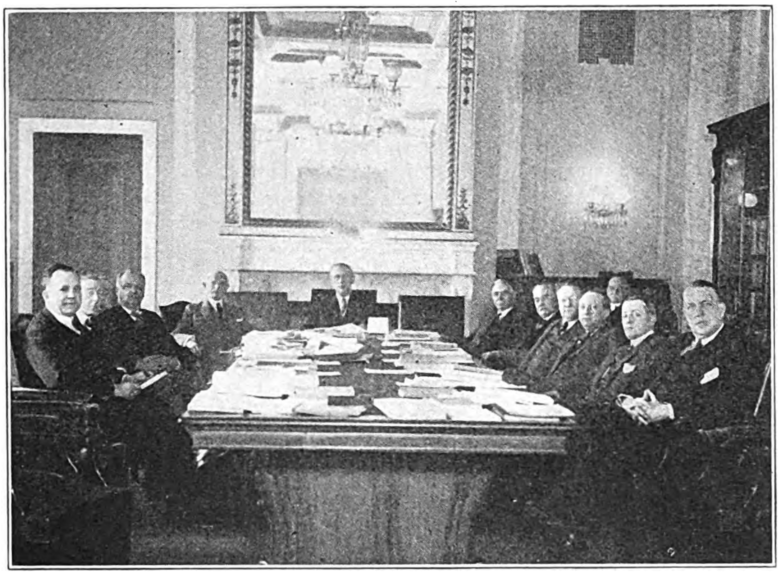
By JOHN M. TOWNSEND
Washington Correspondent, Manufacturers News

Washington, D. C., Mar. 12.—Political terrorism continues to hold Washington in its grasp. Congress has wasted three months, and the sum total of its important legislative enactments has en confined to the passage of two ap- opriation bills, both of which are in nference, and of the tax bill by the use alone. The overawing Senatorial litical inquisition committee, which is ady to pounce upon anybody who has e nerve to suggest sanity and progress in gislation, to impugn their otives and to class them with e defenders of crooks or orse, is still in the saddle. ot until the country mani- stly disapproves of the hys- ria into which the Senate s fallen will the politicians that body realize that they ave over-played their hands d get down to business.

WEEK AT THE CAPITAL -The sole issue in Washing- n this week has been "Do ou know Edward B. McLean nd, if so, how well?" If Mc- ean had not been the prin- ipal issue in the minds of e Senatorial inquisitors, the oolidge telegrams would nev- have been produced. And ho is Edward B. McLean? e is the publisher of the *ashington Post* and was a lose friend and intimate of arren G. Harding. He was rought into the oil scandal y Albert B. Fall who said he orrowed $100,000 from him. his story was disproved a week later by cLean himself, who said he gave Fall hecks for $100,000 but they were not ashed. That story is now under investigation, although it has not been mentioned his week, and it may turn out that McLean ave Fall no checks at all. The question rises, however, what connection McLean ad with the leasing of the Naval Oil eserves to Doheny and Sinclair. So far s the evidence before the Committee goes, e had none and his sole effort was to help ut his friend Fall who found himself in a hole. The McLean episode is merely a side-show at best, with no real relevancy to the Naval Reserve leases themselves; but, nevertheless, the Senate Committee has wasted a week reading the telegrams sent to a vain young man by his personal employes, taking the testimony of stenographers, telegraph operators, subordinates of McLean, of the Department of Justice and the White House on gossip. The routine telegrams sent by President Coolidge to McLean had no relevancy to the investigation, but were broadcasted merely to show that the President was acquainted with Mr. McLean.

COMMITTEE PROCEDURE—In placing the Coolidge telegrams in the record the Senate Committee went further toward arousing suspicion that politics was playing an undue part in its procedure than ever before. Heretofore that conviction has pertained solely to the Senate where the Heflins, Carraways, Harrisons and Robinsons have discussed the developments from day to day, drawing deductions for political purposes which are warranted neither by the evidence nor by common sense. Senator Thomas J. Walsh, the leading Democratic investigator, who has pursued a quasi-judicial attitude in the investigation, was exceedingly wrathy when he found it necessary to include in the record communications passing between himself and Edward L. Doheny a year ago in which Mr. Doheny made the Senator an attractive business offer. Senator Walsh had the sympathy of his colleagues until two days later when the Coolidge telegrams, of practically no import whatever, were made public as soon as discovered. If the Senator was wrathy at being personally insulted, the country has a right to be equally wrathy at an unwarranted attack not only on the President but on the dignity of the office he holds. Lawyers in Washington are totally unable to fathom the procedure of the Committee. Insead of putting Mr. McLean on the stand in utter ignorance of the information the Committee had on him, the Committee has developed the McLean case through subordinates, thereby placing Mr. McLean on complete notice as to what he may be called upon to testify about, and to frame his replies accordingly. Under the guise of doing Mr. McLean harm the Committee may later discover it has aided his defense on such matters as he knows anything about. Furthermore, Harry F. Sinclair, who was pilloried by the Committee a month ago for his absence in Europe, has now been in the country two weeks and there is yet no sign when he will be called. It is beginning to look as though there was some deliberation somewhere in keeping up the hysterical, political outcry and withholding the production of the evidence needed to clear up the real charge of fraud and corruption in the leasing of the Naval Oil Reserves.

TAX FIGHT RENEWED—President Coolidge has again placed himself squarely behind the Mellon Plan of tax reduction in the Senate and the indications are that the Senate Finance Committee will report a tax reduction bill closer to the Mellon Plan than did the House. While official utterances from the White House tend to minimize somewhat reports that the President will sign the Mellon Bill or nothing, the fact remains that President Coolidge is for the Mellon Plan and once this Massachusetts president is for something he can usually be classed as opposed to alternatives which violate the principle of the thing he is for. The Senate Committee proposes to hold some hearings on the Tax Bill before reporting it to the Senate. Senator LaFollette will make a minority report on anything the Republican majority favors and so will the Democrats, and the whole tax fight will eventually have to be fought out on the floor of the Senate. In the meantime, the President is urging that Congress pass a joint resolution reducing this year's taxes by one-fourth, so as to be effective by March 15th when the first installment of



Underwood & Underwood

SENATE COMMITTEE CONSIDERS TAX PLAN

Men Who Will Frame New Federal Revenue Act in Initial Session—Left to Right: Senator R. N. Stanfield, Oregon; David Reed, Pennsylvania; Charles Curtis, Kansas; Richard P. Ernst, Kentucky; Reed Smoot, Utah, Chairman; F. M. Simmons, North Carolina; A. A. Jones, New Mexico; James E. Watson, Indiana; Pat Harrison, Mississippi; Peter G. Gerry, Rhode Island; David I. Walsh, Massachusetts.

this year's taxes is due. On this issue the Democrats find themselves in a hole. They do not like to oppose this action, but they are fearful that if the President gets this legislation outside of the tax bill itself, it will be one embarrassment removed if he finally determines to veto the permanent tax bill.

BONUS LEGISLATION—The House Committee on Ways and Means has decided to report a Bonus Bill to the House as soon as possible and is now in a squabble as to its provisions. The Democrats and some of the Republicans favor an immediate cash payment, the money to be raised by the sale of new bonds amounting to approximately $1,500,000,000; there is also a strong coterie in the Committee which favors the issuance of paid-up insurance policies which, over a term of 20 years, will cost the Government a vastly larger sum and require immediate payments amounting to about $100,000,000 a year.

The chances are that the bill reported to the House will represent a compromise between these two plans, the cost of which will depend wholly on the percentage of veterans who take cash and those who take insurance. The Tax Bill, which has already passed the House, will reduce the Government revenues by $446,000,000, according to the Treasury actuaries, or nearly $100,000,000 more than the surplus now in the Treasury. The Bonus Bill will add not less than $100,000,000 to that deficit, if the Congress passes it in its present form and the President signs it, so that the Treasury faces a stormy career if Congress has its way. In all probability the early passage of a Bonus Bill by the House in the face of an admitted deficit may help rather than hurt the chances of the Mellon Tax Reduction Plan in the Senate, but it is doubful whether or not the President would sign any bonus bill which either increased the bonded indebtedness of the country or failed to fall within the certain revenues of the Government without new taxation. When faced with this layout in the late Spring, just before the National conventions meet, even the politicians in Congress may try to think twice.

DAUGHERTY WILL GO — President Coolidge has progressed in his handling of the Daugherty controversy to the point where he is determined that Mr. Daugherty will not remain as Attorney-General until the conclusion of the Senate investigation of his conduct of the Department of Justice. All that really remains to be settled is the day, the hour and the manner of his going. The President is manifestly not satisfied that Mr. Daugherty can conduct the important work before that Department and, at the same time, attend to the work of the investigation. He has been compelled to think of the interests of the Government while, at the same time, undertaking to give Mr. Daugherty a square deal in every sense of the word. Mr. Daugherty has now returned from Florida in a somewhat calmer frame of mind than he took with him from Washington, and developments in his matter may be expected at any time. The President is also expected to name a new Secretary of the Navy any moment.

Should Children Be Forced to Attend School? At What Age May Work Begin?

THERE are a number of bills in Congress providing for submission to the various states of a constitutional amendment which will carry authority to regulate or forbid the working of minors under 18 years of age. It is in line with the modern tendency, amounting almost to a creed, to eliminate work either by legislation, labor union regulations, or plain shirking. Nobody wants to work any more. Everybody wants a white collar job. No one wants to soil his hands. Possibly that is why we have so many burglars, stick-up men and high jackers.

Those who are behind the movement to prevent any work on the part of minors under 18 years of age include trade unionists and also some of our best people. Politicians are making capital of it. Club women are strong for it. It is not a popular thing to say a word in favor of the boy who might want to go to work before that age, or for the boy's mother who might be dependent upon his earnings. Presumably the mother will be pensioned in order that her boy may theoretically go to school but actually runs the streets, fills the pool rooms and joins the criminal class.

Many of our most successful manufacturers and merchants left school before they were 18 years of age, but this is lost sight of in the modern craze for doing away with work—which may or may not be desirable.

Dr. Hugh Grant Rowell, a lecturer in the Teachers' College of Columbia University, New York, and formerly Director of Health and Hygiene in the New Bedford, Massachusetts, School Department, views the child labor problem sanely. He says that only careful and comprehensive field studies of different industries can give us the solution to the child labor problem, and expresses the opinion that what is really needed in most cities is the actual observance of the present child labor laws with, perhaps, a few minor amendments rather than any startling changes.

"As to the age at which a child should be employed," said Dr. Rowell, "I differ from many in believing that it is largely to be determined by the physical development and physical welfare of the child. It should never be below 14, but in New Bedford there was no reason to make it higher; in fact, there was every reason for using 14 and, as has been seen, no apparent harm resulted.

"To many children, granting right working conditions, extra funds mean better living, greater self-respect through independence, a little money for things greatly desired and heretofore unobtainable, as compared with a school career which is irksome and to which they react unfavorably. For the school it means fewer troublesome pupils who have lost interest in study or who have reached their mental limit. These children, however, often become very different and desirable citizens when they have a job. I have seen just such cases. On the other hand, 16 has the advantage of making careless control of the younger group impossible.

"At present there is too great a tendency to emphasize chronological age as the basis for sorting. This is the poorest and most unsatisfactory basis possible. Anyone familiar with the growth of children realizes that two children of the same chronological age may differ utterly in physiological, or mental, or other 'ages'. The only justification for using chronological age at all is that we must have some minimum which is absolute. Thus, what we actually mean when we use chronological age as a standard is that the average children of the permissible minimum age ought to be able to work at selected tasks without fear of injury to growth (physical or mental)."

Abuses In Internal Revenue Bureau Injury to Business

Charges of wholesale abuses in the Bureau of Internal Revenue and demands for important reforms in the administration of the income tax laws are contained in a special report recently issued by the National Industrial Conference Board and sent to all members of both houses of Congress. The report was compiled, after months of research, by a committee of nationally known business men and economists, including Thomas S. Adams, Professor of Economics at Yale University and expert adviser to the Treasury Department.

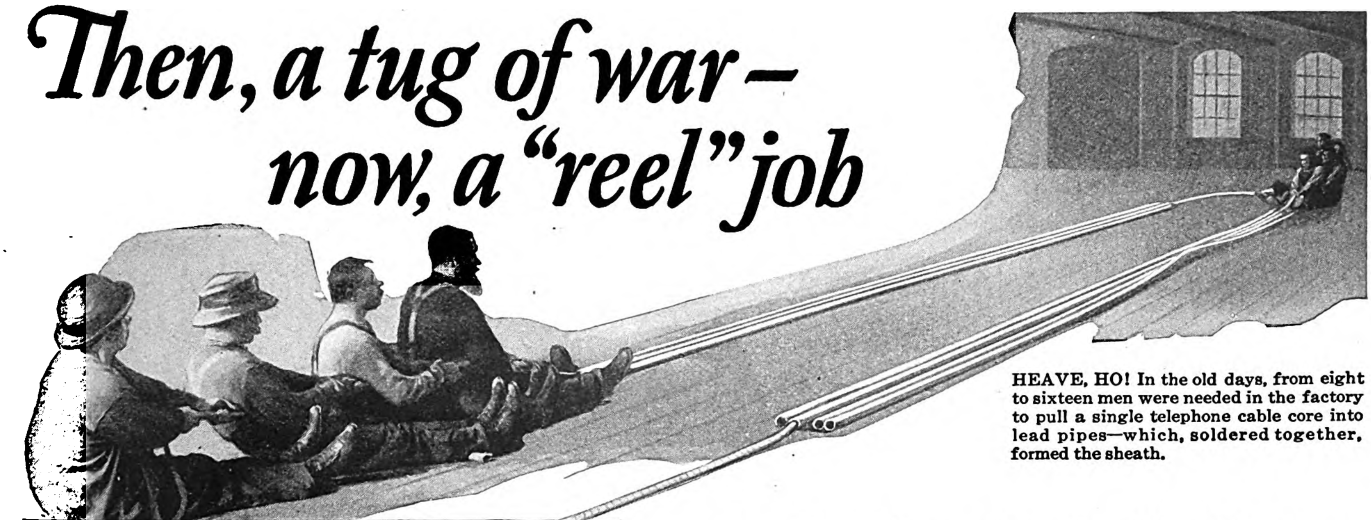
Stress is laid upon the fact, as first developed by the Conference Board last Fall in advance of the Mellon Tax Reduction Plan, that the nation's tax bill still eats up one-eighth of the per capita income, and that it has doubled in the last ten years.

"Dissatisfaction with our present administration of the income tax is heard on all sides," says the report. "Business firms are sometimes confronted with assessments that are many times the tax as finally determined, return of which often takes years, and in the meantime the threatened tax makes impossible necessary business extensions and improvements."

Industrial Engineers to Meet

The eleventh national convention of the Society of Industrial Engineers will be held in Buffalo, N. Y., April 30, May 1 and 2. The major subject, "Reducing the Cost of Business," will embrace papers and discussions dealing with the various departments of business—administration, sales, production and personnel.

Then, a tug of war— now, a "reel" job

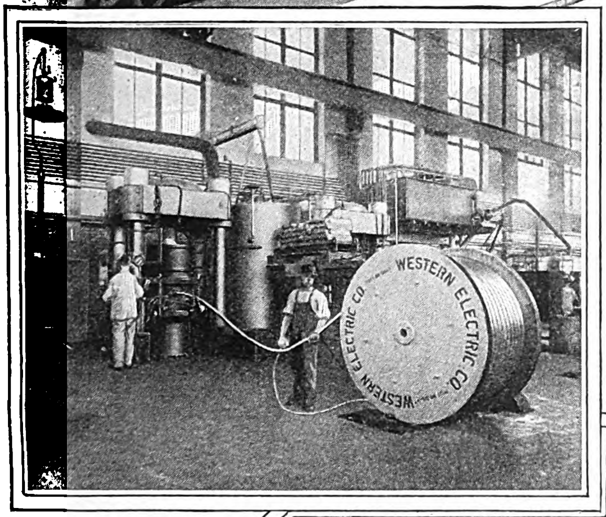


HEAVE, HO! In the old days, from eight to sixteen men were needed in the factory to pull a single telephone cable core into lead pipes—which, soldered together, formed the sheath.

THE pictures show the old and the new way, as applied to two manufacturing processes of many thousands in our factory

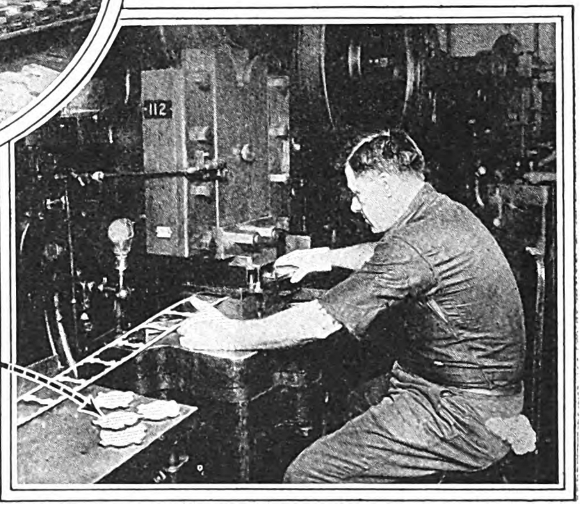
Better work, quicker work, and yet with fewer men needed for each job—progress like this marks the history of Western Electric as a maker of telephones.

Improvements of this kind have made possible lower costs of manufacture and vastly increased production, and here you have two reasons for the vast number of telephones in the United States—more than in all the rest of the world.



HOW IT'S DONE TODAY. Now two men, operating this lead press, can cover more cable than the sixteen did the old way — and what's more, they do it better.

MOLDING TRANSMITTER FACES the old way. Another case of many men producing a small output—with much of it failing to meet the high standard required.



THE TRANSMITTER FACE TODAY. One man produces more than the crew of yesterday, and with a far higher percentage of perfect pieces.

Western Electric

SINCE 1869 MAKERS OF ELECTRICAL EQUIPMENT

Steam demands increased, but costs were lowered

AN eastern plant's battery of six boilers were unable to meet increasing demands. Before purchasing a new boiler, however, they installed Republic instruments. When each boiler's proper combustion rate was determined with their aid, instead of adding a boiler they were enabled to cut one out of service. Thus a spare was created, and the cost of a new boiler saved.

Steam cost need not mount in direct proportion to an increased demand. The primary function of the graphs printed by Republic instruments is to increase steam output by scientific analysis of conditions. Their secondary purpose is to form a basis for power plant cost accounting figures.

This new field for cost-analysts is covered in "Power Plant Cost Accounting." Where shall we send your free copy?

CHICAGO, ILL.

Industrial Employment In Illinois Expanding, Says State Labor Expert

INDUSTRIAL employment in Illinois is again expanding. For the first time since May of last year, the signed reports to the Illinois Department of Labor show that manufacturers are adding to their working forces. The gain from Jan. 15 to Feb. 15 is the largest since March of last year, and the extent of the expansion has been exceeded in only two single months in three years, says R. D. Cahn, Chief Statistican of the Illinois Department of Labor.

Taking a brief backward glance, business appears to have passed through a period of reaction in good condition. Factory operations in Illinois have been throughout the last year at a high level, and though there was a steady reaction commencing in July, the drop was gradual and moderate.

With the sharp recovery of the past thirty days, industry appears to be at the threshold of a Spring of great activity much resembling that of 1923. The level from which the start is taken is somewhat below that of last year, and the expansion is later in getting started. But the same industries are now expanding, which were recording increases one year ago.

Some of the conditions which were impeding progress at the beginning of 1923, are not now present. In February of last year some producers were reporting slow schedules due to the inability to get railroad cars in which to ship their goods. This situation does not now exist. The most recent reports indicate substantial surplus in the car supply.

The employment survey for the month is based primarily upon the signed reports of 1,186 manufacturers of the state. These concerns had 301,410 employes on the Feb. 15 payroll. The identical employers had 294,906 employes on the Jan. 15 roll; so that the month has witnessed an expansion of 2.2 per cent in employment. If the same rate of change characterized employment of other employers, it appears that more than 16,000 persons have been put to work in factories in Illinois during the thirty days under review.

The manufacturers represent fifty-four individual industries, and of this number thirty-seven show net gains and seventeen net declines. Grouping industries by the general nature of the product, it is seen that in metal, stone, and wood industries expansion was the rule, while in chemical and paper increases predominated but declines were also substantial. Only in leather and food was the decline characteristic throughout.

Not alone did February bring work to those unemployed, but it gave steadier work to those who already had their names on payrolls. Average weekly earnings in February for all factory workers amounted to $28.36, which is highest amount of any time since July, 1922, when earnings statistics were first compiled. The February figure compares with $27.27 in January, $25.67 in February, 1923, and $23.72 in July, 1922.

Of thirteen principal cities of the state for which manufacturers' reports are separately analyzed, employment increases are seen to have taken place in all except Danville, Bloomington, and Quincy. The largest gains were in Aurora, Moline, Rock Island, Joliet and Peoria. In Chicago employment rose 2.2 per cent from Jan. 15 to Feb. 15.

Although the labor market in Chicago has shown improvement during the past thirty days, and the large surplus of unemployed men has been reduced substantially, there is still a vast oversupply. Of the thirteen cities in which free employment offices are operated, only Rockford reported more vacant jobs than applicants for work, and 18,728 persons sought the assistance of the free employment service of the state in obtaining jobs during February, and although 9,647 were placed in positions, there were more than 9,000 who could not find employment. There were in February, 155 persons registered for each 100 opportunities to work.

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can — that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

All Size Trucks for Rent

Dump Trucks

Billiards Booming World Over, Says B. E. Bensinger

B. E. Bensinger, President of Brunswick-Balke-Collender Company, Chicago, has recently returned from a trip abroad with the information that the green table pastime of billiards is booming the world over as the game has never boomed before. France, he says, has made great advances in skill during the past year, whereas England, always a great billiard-playing nation, has greatly increased its areas of play in recent years. Germany, a fine billiard country before the war, apparently now has too many other things to think about and at the moment has little time to devote to recreation. In South America the game has taken a firm hold, he reports, while Japan has developed rapidly and has already sent a number of brilliant players to compete with stars in the United States.

N. Y. Woman Labor Act Valid

Hours of work for women in certain industries may legally be set by state law, which may also prohibit their employment after certain hours at night, according to a decision of the United States Supreme Court. The case in issue was brought by Joseph Radice, a restaurant keeper in Buffalo, N. Y., who was convicted of having permitted a waitress to work after 10 o'clock at night in violation of an Act passed by the New York legislature. The Supreme Court's ruling says states may legally pass such laws.

THE FAMOUS MEETING OF THE WATERS AT KILLARNEY
Songs Have Been Written and Poems Fashioned About This, One of the Loveliest Spots In All Ireland

ST. PATRICK ON THE JOB!

By

JAMES EDWARD HUNGERFORD

I.

St. Patrick put the snakes to rout,
An' made the reptiles root;
He was a good ol' fightin' scout—
The snakes, he made 'em scoot!
He chased 'em off ol' Em'rald Isle,
An' straight into the sea;
He finished up the job in *style*—
An' made ol' Ireland free!

II.

He did a lot of other things,
To oust the plagues o' earth;
He had no fear o' men—or kings,
Who had no worldly worth!
When anything became a pest,
He seized his stalwart staff,
An' chased the "varmints" out, with zest,—
An' made 'em *feel* the gaff!

III.

Clad humbly in his saintly frock;
His ruddy face aglow;
Upon his breast a gay shamrock—
He feared no fiend, or foe!
Whenever there were wrongs to right,
In dear ol' Ireland land;
Wherever there were fights to fight—
St. Patrick was on hand!

IV.

An' in the merry month o' March,
We set aside a day
To him—an' march beneath an arch,
As brass bands gaily play!
The sons o' Erin praise his name,
Who feared no devil's clan,
An' ev'ry human does the same—
Who loves a FIGHTIN' man!

TRANSPORTATION

Pennsylvania Railroad's Pension Roll Reached $3,698,636 in 1923, With 7,376 on List—31 Over 90 Years Old

RETIRED employes of the Pennsylvania Railroad System received a total of $3,698,636 in pensions during 1923. This is shown in reports of last year's work and activities of the Pension Department now being compiled by Superintendent E. B. Hunt. The pension payments in 1923 exceeded those of the previous year by $383,972. During the twelve months there was a net increase of 1,083 in the names of workers who have been relieved of their active duties and placed upon the "Roll of Honor" under the pension regulations.

The pension plan of the Pennsylvania Railroad System was inaugurated Jan. 1, 1900. In the twenty-four years elapsed between that date and Dec. 31, last, the Company has paid out a total of $32,187,868 in pension allowances, and retired under the plan a total of 16,406 employes. Of these 7,736 are still living and receiving pensions.

There are at present thirty-one retired workers on the "Roll of Honor" who are 90 years or more old. Their combined ages total 2,845 years. There are 772 pensioners of 80 years old or over. Of the 90-year men, eight have been on the "Roll of Honor" for more than twenty-three years each, having been among those retired when the pension plan was originally established.

An analysis of the service records of the entire group of "Roll of Honor" men show that the typical Pennsylvania Railroad employe renders about forty years of active service prior to retirement.

C. R. I. & P. to Spend $6,500,000

The Chicago, Rock Island & Pacific Railroad will expend approximately $6,500,000 in improvements during 1924, according to an official announcement. The program includes the replacing of about 296 miles of track with new heavy rail at an estimated cost of $1,850,000. About $1,400,000 will be spent on existing bridges, trestles and culverts, and about $400,000 on ballasting. Additional main tracks will be laid at a cost of $425,000. A total of about $350,000 will be expended on track elevation work in Chicago in connection with the separation of grade crossings at Burnside.

B. & O. Celebrates 97th Birthday

The Baltimore & Ohio Railroad Company on March 3d observed its ninety-seventh birthday anniversary. Upon this date in 1827, the charter was granted to the Company, the first railroad in America, by the Maryland legislature. Since then, the Baltimore & Ohio company has far surpassed the fondest hopes of its founders, numbered among whom was the venerable and historic figure of Charles Carroll of Carrollton, who laid its cornerstone.

National Park Opening Dates

The Chicago, Milwaukee & St. Paul Railway announces the open periods of the National Parks as follows:

Crater Lake, Oregon, July 1 to Sept. 30; Glacier, Montana, June 15 to Sept. 15; Lassen Volcanio, California, June 1 to Sept. 15; Mesa Verde, Colorado, May 15 to Nov. 1; Mount McKinley, Alaska, July 1 to Sept. 15; Mount Rainier, Washington, June 15 to Sept. 15; Sequoia, California, May 24 to Oct. 10; Sully's Hill, North Dakota, June 1 to Sept. 30; Wind Cave, South Dakota, June 1 to Sept. 30; Yellowstone, Wyoming, June 20 to Sept. 20; Zion, Utah, May 15 to Oct. 15.

Preparations to take care of a million and a half visitors in all the national parks this year are being made.

Ford Uses 500,000 Freight Cars

More than half a million freight cars, one-fifth the freight car ownership in the country, are used annually by the Ford Motor Company's main plants and various branches.

The average freight charges paid through the Detroit offices direct to railroads, that paid by branches on minor shipments, and freight charges on direct shipments made from manufacturing institutions to branches, approximates $78,200,000 annually. Adding to this about $75,000,000 paid by dealers on shipments of autos received by them brings a conservative figure of $150,000,000 paid every year in freight charges through the instrumentality of the Ford Motor Company.

An average of 860 carloads of freight are handled every day in and out of the Highland Park and River Rouge plants alone, and it is estimated that on the Ford Motor Company's account 50,000,000 pounds of freight in carload lots are handled every day in the Detroit district.

New London-New York Steamship

The Atlantic Transport Line announces that the steamship "Minnetonka" has been launched and is scheduled to make her maiden voyage from London to New York on May 3, returning on May 17. The "Minnetonka" is a sister ship of the "Minnewaska," is 626 feet long, 80-foot beam, depth 54 feet, gross tonnage 21,700, twin screw turbine engines of 15,000 horse power, speed seventeen knots, with accommodations for 369 first-class passengers as well as a large freight carrying capacity equipped with refrigerator chambers for perishable cargo. These ships will make the direct run between New York and London, without calling at intermediate ports, in seven or eight days.

British R. R. Efficiency

The consolidated railroads of Great Britain are rapidly attaining a post-war height of efficiency that surpasses pre-war operations in many respects, says a report to the Department of Commerce. The outstanding accomplishments of 1923 fall into the following categories: Further co-ordination of new groups; introduction of modernized equipment and revised operating schedules; expanded replacement programs for unemployment relief; reduction of charges; preparation of standard tariffs and revision of goods classification; adjustments of hours and service conditions of railways staffs; increases of traffic accompanying better trading year which require additional facilities.

Many innovations were introduced in 1923. Some of the non-stop long-distance runs are entirely new features. One is the North-Western journey from London (Euston) to Prestatyn, a distance of 205 miles. The North-Eastern has developed a Harrogate Special from London which makes a 3-hour and 25-minute run to Leeds, the first stop, a distance of 185 miles. The Great Western established a speed record on its Swindon-to-London service, covering 77½ miles in 75 minutes, or an average speed of 61.8 miles an hour. Longer runs have been speeded up, as for instance Paddington (London) to Aberystwyth, Wales, 234 miles, now advanced from a 7-hour to slightly under a 6-hour journey.

The modernization of rolling stock equipment covers a wide range. Larger and more powerful locomotives are being introduced. New passenger engines of the Great Western, the most powerful used in Great Britain, have a tractive force of 31,625 pounds, compared with previous four-cylinder types of 27,800 pounds. The North-Eastern lines have installed higher-powered freight locomotives for the coal, steel, and other heavy traffic of East Coast industrial areas served by that System.

WHEN INDUSTRY EXPANDS

Headquarters

Is it some heavy timbers you need? Something about 30 x 30, and 120 feet long? Or piling up to 80 foot lengths? Perhaps just some crating lumber? Whatever it is, in any wood, size or amount, we can fill your order with no delay.

Our stocks of some 75 million feet in our Chicago yard of 45 acres are constantly maintained by our own mills operating in our own forests. Unequaled railroad facilities and a mile of waterfront give us shipping accommodations without equal.

In Chicago and suburbs, our own twenty branch yards mean quick deliveries and smaller delivery costs.

Wire us, phone us, write us for anything any time. Our facilities make us national headquarters for lumber.

FOREIGN TRADE

Depreciated Exchange in Western Europe an Obstacle to Sales of American Goods—Effect of High Dollars

DEPRECIATED exchange, while complicating sales problems, does not render the extension of trade impossible in a country where business and indus- y are sound, says the Department of Com- erce, It does, however, make a greater emand on the sales ability of the Export anager and requires efficient choice of gents. Since European countries tend to e price markets, it is not sufficient to lace an agency and wait for results while uropean competitors feature a lower riced article and get the trade. The agent ust be backed up with advertising; the anufacturer's representative should visit urope, the oftener the better. If the merican producer views his European usiness as a regular feature of his turn- ver, the overhead thus entailed will be ompensated by actual results. But a ountry of depreciated exchange is not the ield for experiments with new and un- nown products for which the creation of market requires time, effort, and expense.

When an article of recognized quality nd utility does not sell in a low-exchange country, the explanation (barring always a complete collapse of the monetary system and of the national purchasing power) lies less in the exchange alone than in one or several of the following factors:

(1) The article has not been sufficiently well introduced to maintain a demand in spite of increased local prices.

(2) A local product which fills the public's requirement has been brought out with a lower production cost and, therefore, lower sales price in the native currency.

(3) A similar product from a neighboring country, though perhaps of inferior quality, is a better buy in point of price on account of temporary currency derangements.

(4) The article does not meet with local needs or satisfy a demand which local living standards or conditions have not as yet produced.

The difficulty of introducing corn products, for example, lies not in exchange but in the popular aversion to corn as anything but poultry and animal feed. Neither are cooked and uncooked breakfast cereals good sellers, first, because the bulk of the population eats a very small breakfast and second, because a cooked cereal is considered infant's food. The main hindrance is thus not exchange or consumption but popular taste.

On the whole, depreciated exchange is a considerably less serious impediment to the sale of a well-known article than to the introduction of a new product. Further, the difficulty in placing a new product lies not so much in the eventual reluctance of the ultimate consumer to purchase as in the hesitation of an inexperienced and conservative European agent to assume the risk of stocking an American article during a period of exchange fluctuations when he stands to lose money by not covering properly.

Watch Mr. Ringrose

The Chicago office of the Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce, has issued the following notice:

"This is to call your attention to the fact that a Mr. Ringrose of Paris, who represents himself as publisher of an International Business Directory, has been circularizing American firms soliciting registrations for the proposed directory, charging a fee of $10 for such listing.

"Inasmuch as information received from a reliable source rather doubts the validity of the proposition, it is suggested that recipients of such circulars obtain the benefit of the information available in the Commercial Intelligence Division before taking definite action."

1923 Exports of Leather

The total value of exports of leather from the United States during the calendar year, 1923, according to the Hide and Leather Division, Department of Commerce, amounted to $42,833,952, which represents a slight decrease in value as compared with 1922, when they amounted to $45,471,108. Although there was a decline in the total value of exports, there were increases in a few of the individual classes of leather, particularly sole leather, glove leather, and upholstery leather.

Exports and Imports of Eggs

The foreign trade in eggs consist in eggs in the shell and in preserved egg, such as egg yolk, egg melange, and egg albumen. The principal feature of our foreign egg trade in 1923 is the great reduction in imports of eggs in the shell, the quantity having dropped from 1,019,170 dozen in 1922 to 412,149 dozen in 1923. There was also a slight reduction in the exports of eggs, that is, from 34,620,050 dozen, valued at $9,094,018 in 1922, to 30.658,262 dozen, valued at $8,430,297 in 1923.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

BELGIUM—9377, bacon, 100-ton lots; 9411, cedar bolts, white; 9377, lard, 100-ton lots; 9411, lumber; lumber product; 9377, livestock for slaughtering, such as beef, sheep, and horses; 9416, wool, pressed, in sheets, for mattresses.

BRAZIL—9375, fire-fighting equipment, modern; 9440, shoe polish.

CANADA—9412, hammers or drills, portable, electric.

INDIA—9372, remnants and seconds of cotton goods.

IRELAND—9426, bags, cloth, second-hand, all kinds; 9384, barley for brewing; hops, best quality; 9402, onyx, Arizona; 9378, slates, roofing; 9382, slates, roofing; 9380, shotguns and ammunition for sporting purposes; 9381, shotguns and ammunition for sporting purposes.

MEXICO—9371, shooks for potato barrels.

NETHERLANDS—9386, canned pineapple; canned corned beef; canned salmon.

PANAMA—9424, sugar mill machinery.

POLAND—9429, tires, automobile.

PORTUGAL—9443, olive oil presses and extractors, hydraulic.

PORTUGUESE EAST AFRICA—9383, cotton goods (prints).

SOUTH AFRICA—9427, clothes pressing machines; 9374, pulleys, pressed split steel and water and steam valves; 9427, range—fish and potato chips.

SPAIN—9417, ice-making and refrigerating machinery for hotels and restaurants; 9439, locomotives and supplies for meter gauge railways; machinery and railway materials, for electric railways; 9428, mining machinery; mining materials and supplies.

SWITZERLAND—9432, cereals; food specialties; fruits, dried; preserves.

SALES MANAGEMENT

Hooking Direct Mail Follow-up to Personal Selling Increases Sales and Cuts Down the Cost of Selling

By HOMER J. BUCKLEY
President, Buckley, Dement & Co.
Advertising Specialists

1.

THE firing line of business is not in an office—it's out in the field selling, and there never were greater opportunities for good salesmen—men who can do creative selling—than there is today in the insurance business—in all its branches—and particularly in the health and accident field.

For seventeen years, I have talked, heard and breathed advertising—nothing but advertising—in some one or more of its various phases. Time and again I have seen advertising sell a factory's output overnight. I have seen an apparent failure retire in the face of good advertising, and success step in. I have seen advertising do so many wonderful things that it takes a startling advertising tale, indeed, to produce any marked impression upon me.

But in all of this, I have always recognized that advertising, speaking generally, is only one of the principal factors of business building. There is still a greater element to be reckoned with, and that element is *personal* selling.

Advertising will help the salesman make more sales in any business (and goodness knows there is need of some creative advertising in the insurance business) and occasionally advertising, which is nothing more than printed salesmanship, anyway, will supplant the sales forces entirely; but instances like that are not common, and practically unknown in the insurance field. Twenty-four out of twenty-five times it is the flesh-and-blood salesmen who hold in their hands the key to success or to failure of an insurance agency.

I have been selling merchandise or service through the spoken and printed word ever since Marshall Field & Company hired me, twenty-nine years ago, at $5 a week, to make myself useful. To me, selling has always been the most interesting business in the world, and probably always will be.

When we *sell*, we work on people's minds. Artisans mold metal and rubber into inanimate things: we salesmen are molding minds and human actions. One cannot find anywhere more sensitive material upon which to work.

The salesman's reward is proportionate to his merit. He is not confined to any single place, product, or firm. His possibilities and his earning power are not limited by the work of his associates. If he can really sell, the world is his. His services are in demand when good production men may be walking the streets. The salesman who will do well for himself and his house in prosperous times, will be worth more than ever when sales in general are scarcer and harder to make.

I have had the privilege of seeing many salesmen not only in the insurance line, but in many other fields, go through their paces. "Wind jammers," "high pressure artists," "slickers," "one-time" salesmen, the "honest-but-dumb," the capable kind, the more capable and the most capable, all the way from the salesman who drones his catechism to the other extreme, typified by the Curtis Publishing Company space representatives, whose performance is as different from that of the ordinary salesman as the work of a master mason is different from that of the green apprentice.

Cut Down High Cost of Personal Selling

MR. BUCKLEY, one of the Masters of Salesmanship in the United States, recently delivered this address before a group of insurance men, the Health and Accident Underwriters' Conference, but his selling arguments and advice, the results of long years of intensive work and close study, are as important and applicable to any other line of merchandising.

This is the first installment of Mr. Buckley's address; the second will be published on this page next week.

And of all these general types, the most efficient and the best rewarded salesman is that one who has truly studied the business of selling as a business in itself. He has mastered the art of approach, the swing into his subject, the creating of desire, and the final clinch that brings the name on the dotted line.

His *sales presentation* is never twice alike—because no two buyers are ever alike. His principles of selling are always alike because principles never vary. He is a real salesman, usually not a "born salesman" but one developed to the point where hit-and-miss methods and luck have been virtually eliminated.

To watch one of these men "work" is like watching a well trained baseball team in action. There each player is a thinking unit that knows what to do, when to do it, and how to do it. Together, the team presents a varied attack and a stout defense, always the same in principle and always a little different in application. They will lose games occasionally, but they will win games consistently. The luck element cuts little figure.

Again, like winning teams, good salesmen are usually *developed*, and not the lucky result of birth or happenstance. Salesmen become good salesmen only by the study and intelligent application of the correct principles of selling and by the scientific development of their sales ability.

A man may burn the midnight oil and work like the mischief all day long, but that is only half the story. Native ability is like a splendid automobile without tires. If a man's study and his work are not intelligently applied, he will find his road full of bumps and mistakes.

The reason there are so very few scientifically trained salesmen is because the average salesman of today does not think he needs to spend any of his time in study. He has been fortunate and landed a couple of big orders or contracts and assumes, therefore, that he knows all there is to know about salesmanship. But the day is coming when only the man who has looked upon selling as a profession, and as such has prepared himself for it, will be able to bring in the order.

If I were starting in at the bottom to learn selling all over again, I am sure I could double my progress if I associated myself with some company which was giving the men a really practical training in selling.

(To be continued)

U. S.-French Industry Show In New York, Apr. 22-May 3

Under the official patronage of the French Government, a French industrial exposition will be held at Grand Central Palace, New York, April 22 to May 3. Its object is to promote and develop larger commercial relations between France and the United States.

The exposition is being furthered by Ambassador Jusserand, Myron T. Herrick, Ambassador from the United States to France, and industrial leaders of France and America. It is a non-commercial venture, the expenses having been guaranteed by the Board of Directors.

AUTOMOBILE—AVIATION

Lincoln Highway, Nearly Completed, Has Cost Over $53,000,000 in Ten Years—Route Is Four-fifths Finished

"TEN years of constructive transportation development in the history of the world have passed since the Lincoln Highway was first laid out late in 1913," says the New York *Journal of Commerce*. "Those ten years have witnessed the expenditure of over $53,000,000 on the improvement of the Lincoln Highway—have brought the route to a point where it is four-fifths completed and in one-half the time it was originally estimated would be required for completion.

"Last year 361 miles of new construction were completed on the Lincoln Highway—an exceptional season. At such a rate of progress the route should be completed between the two coasts in less than five years.

"Last year the eleven states and ninety-six counties traversed by the Lincoln Highway, aided by the Federal Government, expended very close to $6,500,000 on the completion of 361 miles of the road and on maintenance. The mileage built in each state, its cost and the amount expended for maintenance are shown in the following table:

State	Mileage	New Construction	Maintenance
New Jersey ..	10.45	$402,985.32	$246,492.15
Pennsylvania .	46.55	522,836.87	339,208.43
Ohio	8.07	441,867.38	47,242.13
Indiana	25.50	538,822.47	62,232.28
Illinois	19.87	553,552.84	35,382.38
Iowa	23.09	381,974.00	141,084.00
Nebraska	56.21	610,235.91	92,792.73
Wyoming	76.70	400,140.00	77,340.72
Utah	7.32	230,120.79	22,000.00
Nevada	75.00	687,023.44	53,537.33
California	12.36	338,106.04	223,376.82
Total	361.12	$5,107,665.06	$1,340,688.97

"Total expended on Lincoln Highway in 1923, $6,448,354.03.

"The traffic of this year will be the heaviest in history. The increased traffic is bringing about better accommodations for the tourists, more and more adequate hotels, inns, garages, service stations and camp sites. Roadside filling stations are now found at frequent intervals and there are eighty-seven free camp sites along the Highway, by far the majority of these being West of the Mississippi River. A good one can be reached by the auto-camper every night."

Auto Operating Costs

The total cost of operating a light car is approximately 5 cents a mile in family use, according to the experience of many users of light cars shown in data collected by the Chevrolet Motor Company. In commercial service cost per week ranges considerably higher, but the cost per mile is less. One company operating a large fleet of light cars found its 1922 total costs .0377 a mile, including drivers' salaries. The average family drives a car about 5,000 miles a year.

One Michigan company operating 150 cars in both city and country for salesmen and solicitors finds its average cost 6¼ cents a mile. The Morton Salt Company which operates a fleet of Chevrolet cars, keeps a detailed cost account and found in three typical months of July, August and September, 1923, the average cost per mile was $.0388, $.0360 and $.0377 respectively.

"Mother Shipton" Makes a Prophecy

POETIC license is ofttimes granted poets for statements not generally given credence. So, when "Mother Shipton," some 350 years ago, "prophesied" the coming of automobiles, aeroplanes, monster steel ships, etc., she was undoubtedly granted "poetic license" by those of her friends who did not care to express themselves in stronger terms.

MANUFACTURERS NEWS is indebted to William Butterworth, President of Deere & Company, Moline, Ill., for the following, and for the information that "Mother Shipton" was a witch and prophetess, living in early Tudor times, believed to have been born about 1486. Following is her "prophecy":

Carriages without horses shall go and
Accidents fill the world with woe;
Around the world thoughts shall fly
In the twinkling of an eye;
Water shall yet more wonders do,
Now strange, but shall be true;
The world up-side down shall be and
Gold be found at the root of a tree;
Through lands man shall ride, and
No horse nor ass shall be at his side;
Under water men shall walk,
Shall ride, shall sleep, shall talk;
In the air man shall be seen,
In white, in black, in green;
Iron in the water shall float,
As easy as a wooden boat;
Gold shall be found, and found
In a land that is not yet known.

This "poem" is said to have been written about 1562.

Auto Exports Break Records

The year 1920 has gone down in the annals of the automotive industry as breaking all records for shipments to foreign countries. Yet 1924 has begun even more auspiciously than did 1920. The total value of automotive exports from the United States during January was $18,465,202, compared with $16,892,651 in January, 1920, an increase of 9.3 per cent. Compared with $10,787,344 worth of automotive exports in January of last year the increase was 71 per cent according to figures compiled by the Department of Commerce.

Takes Over Stanley Steamer

The Steam Vehicle Corporation of America has taken over the Stanley Motor Carriage Company at Newton, Massachusetts, and has laid plans for a larger production of Stanley steam cars than has ever before been accomplished, according to George T. O'Brien, Stanley Steamer distributor in the Middle West. Together with the increased production of the new model, there will also be the commercial steam taxicab and bus, a field heretofore uncovered and in which there is an already large demand.

218,286 Buicks Sold in 1923

Buick in the year ended Dec. 31, 1923, sold 218,286 cars. The sales for the past three years follow: 1923, 218,286; 1922, 138,520; 1921, 83,888. When Buick has rounded out its program for increasing existing facilities of its main plant at Flint and its subsidiary plant at Detroit there will be a capacity for the production of between 235,000 and 260,000 cars annually.

25% Stolen Cars Not Recovered

More than 200,000 automobiles were stolen in twenty-eight key cities of the United States in six years, of which nearly 25 per cent have not been recovered. This is shown in a table of figures on thefts and recoveries made public by C. A. Vane, General Manager of the National Automobile Dealers' Association. The cars stolen in 1923 totaled 39,612. Of this number 7,228 were unrecovered Jan. 1.

The percentage of unrecovered stolen cars in the twenty-eight index cities for 1923 was 18 per cent, the lowest recorded since the records have been kept.

Thefts in the index cities totaled 203,499 cars in six years. The recoveries totaled 153,827 cars. The total of cars unrecovered is 49,677.

BUSINESS AND FINANCE

*"History and Origin of Investments"—Modern Corporations and Their Financing Through Stock and Bond Issues

With this issue Mr. Stevens' article on the "History and Origin of Investments" is concluded. The next article in this series on "Fundamentals of Investment," being delivered before the Y. M. C. A. School of Commerce under the direction of the Investment Bankers' Association of America, will be on "The Field of Investment," by C. W. Sills, Vice-President of Halsey, Stuart & Company.—Editor's Note.

By EUGENE M. STEVENS
Vice-President, Illinois Merchants Trust Company, Chicago

IV

MODERN corporate organizations are of three classes—public, semi-public and private. The public corporations are those of governments, states, counties, cities, towns, school districts, etc., which are the combined interests of all the people. The semi-public corporations include the railroads and various public utility corporations which are operating, to some extent, under rights granted them by the governments, such as the right of eminent domain, in the case of the railroads, where, under governmental authority, they are allowed to acquire property necessary for their use at a fair price, even if the owner may not desire to sell, and in the case of street railways, where cities give them the right to use city streets. In return for these rights, which the government has granted them by representative authority of all the people, it is proper that such semi-public corporations be subject to some governmental supervision as to their service to the people, their rates and otherwise. The third class, or private corporation, includes generally most of the great industrial corporations engaged in the manufacture and sale of commodities to the people.

The financial structure of these semi-public and private corporations sometimes appears complex, and yet it is based on the two simple fundamentals of money furnished for ownership and money furnished on loans. A corporation may be organized and sell its shares of stock, representing the ownership of that corporation, to a few or to a great many people, and frequently these shares, being transferable, are thereafter bought and sold through the stock exchanges or otherwise as securities in the open market.

There are certain corporations which have shareholders to the number of hundreds of thousands and their stock, representing these shares, is traded in back and forth, every day, in large volume. These stocks may be divided into different classes, the most common of which are the preferred and common stocks. Preferred stock is usually restricted to a specified dividend return and its dividend is payable to the full amount, even if nothing may be left out of the earnings to pay dividends to the common stockholders. Preferred stock also usually has a prior claim on assets of the corporation, over the common stock, and if it should be necessary to close up and liquidate the business, the preferred stockholders would have to be paid their principal in full before the common stockholders would receive anything.

The Market for the Week Ending March 8

	High	Low	Last	Net Change
20 active rails .	81.21	80.51	81.09	— .23
20 active industrials . . .	98.61	97.10	98.25	+ .76
20 active coppers	23.99	23.58	23.58	+ .05
40 active bonds	87.45	87.31	87.31	— .10
Chicago May wheat . . .	112⅛	110¾	111½	+ ¼
Chicago May corn	81⅞	80⅛	81¼	— ½
New York Mar. cotton . . .	28.90	27.40	27.98	+ .03
New York call money . . .	4½%	4¼%	4¼%	— ¾%
New York com'l paper	5	4¾	5@4¾	..
Sterling exchange . . .	4.30	4.25¾	4.25¾	—.04⅜

The common stock, in return for giving up these privileges to the preferred stockholder, is not limited in the amount of dividends it may receive out of the earnings and, if the business is very successful, it would probably pay a larger dividend return on the capital invested than in the case of the preferred stock.

Such corporations frequently find it necessary to borrow money. This may be done generally in two ways, the first of which is by making temporary loans from banks for temporary working capital. For instance, a manufacturing corporation may have large orders for their product and may need to borrow money to pay for their raw material and their labor, until such a time as the manufacture is completed and the product delivered and paid for. In practice, many corporations—including railroads, public utilities and private organizations—have found it feasible to obtain capital in more permanent form by placing mortgages on their property and issuing bonds secured by such mortgages, which bonds are sold in small denominations to the general public.

These bonds may be of various classes, including what are in effect first mortgage, second mortgage, or in some cases what are really third and fourth mortgages under various names, and may cover various classes of property. For instance, the railroads have large bond issues outstanding, secured by mortgages on the railroad property itself, but frequently they have other mortgages on their equipment or, in some cases, on their terminal properties in cities.

In addition, therefore, to the bonds issued as promises to pay by our governments and municipalities, there are these various corporation issues in the way of preferred stock, common stock and various classes of bonds, which are open for public investment and are generally classed as "securities." These are the classes of investments concerning which the present course is projected.

(*Copyrighted, 1924, by The Investment Bankers' Association of America.)

Savings Bank Men to Meet

Meetings of the Savings Bank Division of the American Bankers' Association are to be held in Chicago, Los Angeles, New Orleans, Seattle and New York, on March 19 and 20. The Chicago conference will cover the states of Ohio, Indiana, Michigan, Illinois, Wisconsin, Minnesota, Iowa, Missouri, Nebraska, Kansas, Colorado, North and South Dakota. Some of the interesting subjects to be discussed are: "Obligations of the Savings Bank to Society," "The Agricultural Community and Savings," "Savers—Actual and Potential," "Why Men Save," "Industrial Savings," "School Savings," "Savings and Life Insurance."

Savings Deposits Stationary

According to statistics furnished by 877 banks distributed throughout the United States, the volume of savings deposits was almost the same on Feb. 1, 1924, as on Jan. 1, 1924. A total of $6,906,449,000 was reported on Feb. 1, 1924, as compared with $6,908,553,000 on Jan. 1, 1924, and $6,382,006,000 on Feb. 1, 1923. The increase in deposits over those of a year ago amounted to 8.22 per cent.

G. Hoff, 76 Years Old, Enters Night School for Study of Cost Accounting

MUEL G. HOFF of Kokomo, Ind., 76 years old, lately entered the night ool of his city to take a course in cost ounting, something in which all manu-urers are interested.

he fact that Mr. Hoff was taking up course at his time of life was so un-al that MANUFACTURERS NEWS te to him, asking for details. He re-d:

'I believe there is nothing more im-tant for any business man to know than t-where-he-is-at' all the time of his busi-s career. At present I am engaged in stering the details of up-to-date cost ac-nting as employed in the different types manufacturing and mercantile establish-nts.

"Without knowledge of where and how ch his profit or loss is, a business man in the dark as to the exact condition of business. Therefore, cost accounting uld be an advantage to any manufac-rer.

"The farmer who does not follow up-to-te business methods in this day is doing haphazard business. To achieve the most success he must know the value of his entire investments—real estate, farm equipment, its appreciation or depreciation, the cost of repairs, replacements, labor, marketing, seed, cultivation, fertilizers and so on. He also must have exact knowledge regarding the sales of his various products, interest on his investments and the amount of his taxes. In no other way can he know his exact condition than by that of cost accounting, the acquisition of which would, in my opinion, be an asset.

"The same is true with any merchant who deals with various articles or lines of merchandise. By installing a proper system of costs he knows the lines which are the most profitable and also those which show a loss. Hotels, restaurants, boarding-house keepers and similar enterprises would get along much better if they installed practical cost accounting systems.

"I suppose it was natural for me to take this course. I have been engaged in teaching and keeping books for quite a number of years and part of this time I was Superintendent of the Bookkeeping Department of a prominent commercial school. I have been engaged in auditing, opening and closing different systems of bookkeeping, and doing other accounting work closely related to the subject of costs."

Vorld Advertising Clubs Charter Second Big Liner

The Associated Advertising Clubs of the 7orld have chartered the Cunard liner Lancastria," formerly the "Tyrrhenia," as e second ship to carry delegates to the ventieth annual convention of the clubs be held in London July 13-18. The rst ship chartered was the "Republic" of e United States Lines. Approximately ,300 delegates will sail on the two ships -750 on the "Republic" and 550 on the Lancastria." Both boats will sail from ew York on July 3. The ships will travel cross the Atlantic together and will be in onstant touch with each other. Daily ewspapers will be printed on each ship nd news will be wirelessed back and forth.

"Own Your Home" Exposition

The fourth annual Chicago "Own Your ome" exposition will be held in the Colseum March 22 to 29. Approximately a nonth later—April 19 to 26—the sixth annual exposition will be held in the 69th Regiment Armory, New York City. It is stimated by the Chicago Real Estate Board that $5,000,000 worth of home construction was undertaken as a direct result of the Chicago and New York expositions.

Classified

Butler, Indiana, Pop. 2000, wants factories. Three main line R. R. on Toledo to Chicago pike, labor plentiful; will assist in getting you started. Representative will be in Chicago from March First until April 15th. Write Mr. Frisbie, care of this paper, for interview.

Every Audit Should Be

A Detailed Audit

The leaders in practically every field of business now regard the *Detailed Audit* as an absolute necessity. The Reserve Cities Bankers Association, and most of the Credit Associations throughout the country, stand on record as preferring it to the Balance Sheet Audit.

Offering an expert and independent study in *detail* of the items represented *in mass* by balance-sheet figures, the *Detailed Audit* not only verifies, but clarifies. *It digs beneath the figures and reveals the buried facts.*

Every audit should be a *Detailed Audit*. It brings to light avoidable leaks and wastes. It finds the flaws in accounting, in credit and collection methods. It presents the cause, and the effect, of financial policies. It points to possibilities for greater profits.

Free from the qualified statements of the Balance Sheet Audit, the Detailed Audit is the ideal basis for credit. Complete in its presentation of the *facts* behind the figures, it is the only basis for executive plans and action which lead to progress and success.

American Steel Foundries Had Biggest Year in 1923

"The operations for 1923 were the most satisfactory in the history of the Company," said R. P. Lamont, President of the American Steel Foundries, in his annual report of the business of the past year. The financial statement reveals that net income for 1923 was $7,595,944, which, after allowing for larger preferred dividends than the previous year, left a balance equivalent to $9.55 a share on the common stock, as compared with $3,709,866 or $4.23 a share in 1922.

There was paid $2,166,588 to common stockholders in dividends last year, compared with $1,836,090 in 1922, but the 1923 surplus after all charges and allowances was $4,729,636 against only $860,264 the preceding year. Total surplus now is $14,560,931.

The balance sheet also shows an exceedingly strong position. Net working capital increased from $14,952,619 to $20,134,151, liabilities declining slightly concurrent with a material improvement in quick assets. Inventories decreased from a year ago, but cash is more than $4,500,000 larger, and government securities nearly $3,000,000 greater. Of $23,900,796 in current assets $10,095,995 or nearly half is in cash or government securities. The ratio of quick assets to liabilities is better than 6 to 1.

The Company extinguished its funded debt during the year and increased its reserves.

Kansas Industrial Law Decision

An appeal to the United States Supreme Court to pass on the Industrial Relations Court Act of Kansas, under which August Dorchy and Alexander Howatt, two United Mine Workers' officials, were convicted for calling a strike at a mine in violation of that Act, has been returned to Kansas for final decision by the Kansas Supreme Court. Justice Brandeis of the United States Supreme Court, in delivering the opinion, stated that the Federal court could, if desired, pass on the validity of the Act, but preferred to leave that point to the State courts and would accept their decision.

Industrial Council on Taxes

"Fundamental Principles of Taxation" is the name of a pamphlet recently issued by the National Industrial Council which gives a basic program for the necessary revision of our Federal revenue laws. The booklet was formulated by a special committee representing organized industry.

C. of C. of U. S. A. Studies Costs

A national conference on the development of uniform cost accounting will be held in New York City, March 25 and 26, under the auspices of the Chamber of Commerce of the U. S. A. On the first day the chief topic of discussion will be "The First Steps in Cost Accounting in a Trade Association—How to Arouse Interest." The second day will be devoted to the more advanced problems, among which will be "The Service of the Cost Accounting Committee in Developing Uniform Methods" and "How to Get the Uniform System into Use by the Members of the Industry."

Goodyear Rubber Adds to Surplus

The annual financial statement of the Goodyear Tire & Rubber Company, of Akron, O., as of Dec. 31, 1923, shows net sales (exclusive of subsidiary companies) were $106,026,109 compared to $102,904,177 in 1922. The total combined sales of the Company and its subsidiaries, including the California and Canadian Companies and foreign branches, were $127,880,082 as against $120,450,800 in 1922. Earnings of the Akron Company, after deduction of interest and other charges, showed a net balance carried to surplus of $6,507,245, compared with $4,388,499 in 1922. The Company and its subsidiaries operated during 1923 without bank borrowings and had none on Dec. 31, 1923, according to the report of President G. M. Stadelman to the stockholders.

"Deutschland" Sails March 27

The new Hamburg-American liner "Deutschland" will sail from Hamburg for New York on her maiden voyage on March 27. The return trip will begin on April 17. She will sail regularly between New York and Hamburg, via Southampton. The "Deutschland" is a sister ship of the "Albert Ballin," which was commissioned last July.

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

N entirely new method of giving recognition to the constructive work of fac- y employes in industry has recently n put into effect by the General Electric mpany. At the various plants of the mpany workmen were recently gathered ether and the Works Manager presented tain ones with a sum of money and a tificate acknowledging their contribu- n to the progress of the electrical in- stry.

These awards, comparable to the honors nferred upon engineers by electrical so- ties, were made by the Charles A. Coffin undation, named in honor of the founder the Company, which was established for e broad purpose of stimulating progress d public service in all branches of the ectrical industry—public utilities, elec- ic railways, among graduate students ing research work, and finally among ployes.

So far as is known this is the first time at employes in any large industry, par- ularly workers in the shops, have been ublicly recognized for work they have one for the industry outside of their or- inary duties. Engineers and research orkers have gained public distinction by eir achievements, but the man in the op, as a rule, has seldom become known other than a few of his immediate asso- ates for work that may have had an al- iost revolutionary effect in the branch of ie industry in which he was engaged.

The multiplicity of these achievements, nown to only a few in an organization so rge as that of the General Electric Com- any, with its 80,000 employes, was the urce of astonishment to those who had e task of examining the many claims or recognition which came in from the arious works. W. W. Trench, Secretary f the Foundation, after his study of the laims found that the outstanding ones em- odied three definite qualities, all of which ere necessary to success—skill, initiative, nd perseverance.

There were others than factory workers ncluded in the awards, for the employes vere divided into five classes—shop work- rs, foremen, engineers, commercial and dministrative employes.

There were 150 nominations for awards nade by department and office heads. These were reduced to seventy-nine for inal analysis, and awards were finally nade to forty-eight—sixteeen to engineers, ix to commercial men and one woman, ten o foremen, ten to shop workers and five o administrative employes. There was een competition among the factory managers to obtain representation for their men on the list, and the result of the new method of recognizing ability will be watched during the coming year with much interest by those who feel that it is a step forward in the relations between employes and management.

New Calumet Transmission Line

Plans for the construction of a high-power electric transmission line in the Calumet-Gary District have been announced by the Calumet Power Company, of which Samuel Insull is president.

The new line will carry approximately 55,000 horse power of electrical energy in the beginning, but will be built to carry an ultimate capacity of 150,000 horse power. It will be the most powerful electric transmission line in Indiana and one of the most powerful in the Middle West.

It will serve the great industrial district of Hammond, East Chicago and Indiana Harbor and will extend to East Gary, a distance of sixteen miles. The cost of the transmission line, substation, and private right-of-way, will be approximately $1,000,000. The line will be carried on steel towers the entire distance. These towers will vary in height from 95 to 115 feet.

Anchoring Steel Towers

A unique device will be used to anchor the steel towers of the new $1,250,000 electric transmission line to be built by the Illinois Power & Light Corporation from the power dam at Keokuk, Ia., to Galesburg, Ill. A hole 8 feet deep and 5½ inches in diameter will be drilled where each leg of a tower is to stand. Dynamite will then be lowered into the hole and touched off, blowing a cavity at the bottom 2 feet in diameter. Concrete will be poured into the cavity and the legs of the tower set into it. After the concrete hardens the tower legs will be anchored in solid balls of stone imbedded in walls of earth compressed by the exploded dynamite. It is the first trial, it is said, of the new anchor construction in Illinois, but one now being used in all modern buildings of steel transmission lines. There will be 600 towers, each 65 feet high, in the line which will be 76 miles long. Construction will commence as soon as the ground is soft enough to work. Engineers expect to have the line finished by Fall.

Automatic Phones in Japan

Taking advantage of the destruction of the old style telephone equipment, in the earthquake, the Tokyo Telegraph Bureau is considering the installation of automatic telephones, says the Department of Commerce. This will greatly facilitate the use of telephones by foreigners who found it difficult to secure connections under the old system, and it is generally considered more economical and efficient. The losses in the earthquake were estimated at 150,000,000 yen and replacements will probably not be complete before 1925.

"I'll Call You"

Softens the Pang of Parting

TO the traveler, evening brings lonesome hours. Sometimes you long to pack your grip, jump the first train and get back home at once, regardless of the unfinished business of the trip.

When you feel this way, go to the telephone and call home by "long distance." The Bell wires will carry your voice, which is yourself, back to your loved ones, relieve their anxiety as to your safety, and give you new zest for the morrow's tasks.

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

Incorporated Under the Laws of the State of Illinois

Illinois Manufacturers Mutual Casualty Association

(INCORPORATED)

A Service Department of the Illinois Manufacturers Association

The Illinois Manufacturers Mutual Casualty Association, Inc., has been organized by Manufacturers of the State of Illinois to furnish to the employers of the State efficient service in the solving of plant accident problems.

The Association through co-operation can effect a large saving on Compensation Insurance premiums each year and in addition furnish superior service to its policy-holders.

Full information and rates will be furnished prior to the expiration date of your present policy.

Without Fear or Favor

WHAT manufacturers want in connection with the numerous investigations that are in progress in the Congress, and what most good citizens want, is a revelation as to who are guilty of giving or accepting bribes in connection with the conduct of the affairs of the Government. What they do not want is for those who are conducting the investigations to play politics and spend the entire Summer on the front pages of the newspapers.

When it comes down to hard pan, the average honest voter does not care for the politics of a bribe-giver or a bribe-taker. He wants whoever is guilty punished. Members of the House and the Senate who want to be re-elected will find favor with their constituents much more readily by using their influence for conscientious investigations instead of political inquisitions.

Congress has a wonderful opportunity to win favor with the people by acting promptly, fearlessly, and without prejudice. Senator Borah is right.

Child Labor Controversy

PERHAPS there is some surprise that industrial leaders do not take more active part in the attempt by Congress to regulate the working hours of minors under 18 years of age. There are several proposed amendments to the Constitution pending which would give Congress authority over the working hours of such minors.

Manufacturers and business men hesitate about engaging in the controversy because their motives might be misunderstood. It would immediately be said that they were against the proposed changes because they are in favor of child labor and that they have no consideration for the youth of the land.

The truth of the matter is that the Child Labor Amendment is purely a political proposition, so far as many congressmen are concerned. In some states it is possible that there are overworked children of tender age, particularly in states where they work in the fields. The way to remedy this is not by an amendment to the Federal Constitution, but by state law.

The labor unions and a certain element of our citizenship would forbid all minors under 18 from doing any work whatsoever. Successful manufacturers and business men, a majority of whom were at work long before they were 18 years of age, do not agree with them. They know that much of the crime in this country is committed by boys who have not had the incentive of work. It depends a good deal on the boy or girl. Some of them, no doubt, should go to school. Others would be more useful citizens to themselves, their families and the community if they went to work at the age of 16 or 17, particularly if they attended part-time schools, as they now do in Illinois under the law.

The Immigration Bill

NOW is the time for those interested in amending the immigration law to get in their work. Congress is giving the subject consideration and quite a number of manufacturers, who have the welfare of the country as well as their business at heart, are making suggestions to their congressmen. Among these is Ed. V. Price of Chicago, who is an extensive traveler and a successful manufacturer, who has given careful consideration and study to the subject.

Every manufacturer who has given this question thought should communicate his views to the members of Congress at once.

Pressure for An Illinois Waterway Bill

ILLINOIS and other Middle Western Manufacturers were represented this week by the Illinois Manufacturers' Association in the most important waterway hearing in a decade at Washington.

Many think the Illinois waterway is like the cry of "wolf, wolf." MANUFACTURERS NEWS is more optimistic. We believe there is enough sentiment in the Middle West to induce Congress to pass the right kind of a bill. The Committee on Rivers and Harbors of the House of Representatives is considering several measures. The best known is, perhaps, by Representative W. E. Hull of Peoria. He is a new "M. C.," but he is active and forceful. He knows what he wants. He knows how to get it. Representative Rainey has a bill with good features.

There is some opposition. Everybody wants waterways, but Milwaukee and Detroit and Canada object to lowering water in the lakes to carry off Chicago's sewage and to provide the necessary flow for a 9-foot channel from Chicago to the Mississippi and thence down the "Father of Waters" to the gulf.

If the Sanitary District Trustees had fairly settled past claims for down-state flood damage, the Illinois opposition would be silenced. It pays to be fair. Manufacturers and farmers, whose lands have been flooded, have their rights.

So, any bill that is passed should afford protection from future high water damage, and provide for fair adjustment of claims by arbitration.

Some Federal legislation is needed to provide for water flow and for the removal of obstructing dams in the Illinois River. Then we'll have the 9-foot waterway.

Let's go!

One Way to Reduce Labor Turnover

SOME employers are trying to prevent labor turnovers, which are such an expense in factory operating budgets, by encouraging employes by promotion. A large silk mill in the East, which has general classes for the education and technical training of its employes, is paying particular attention to promotional opportunities. Any workers who wish to fit themselves for better positions are allowed to spend an hour any, or every, day according to their own choice, but on their own time, on any floor in the mills for the purpose of acquainting themselves with the various machines, their usages and operation.

As soon as the employes feel they have a sufficient knowledge of the work in that department, they are allowed to take a practical examination by the Mill Manager in the presence of the Foreman of the Department and the Personnel Manager. If they pass this examination they receive a certificate stating their competency in that line of work. Prizes are given to all students who are successful in their examinations.

When a vacancy arises in the mills, this fact is advertised on the bulletin board and applications are invited, which are carefully considered by a committee consisting of the Mill Manager, the Foreman of the Department concerned, a representative of the workers and the Personnel Manager. Merit alone decides; seniority being recognized only when everything else is equal.

Perhaps some of the manufacturers who are complaining of labor turnover will find merit in the policy observed by this Eastern manufacturer.

British Workman's Pants

YOU will notice in all pictures of British workmen that they have their trousers tied up at the knees. It is a class distinction as inevitable as the smock worn by French workmen. You never see anything like it in the United States. The reason is found in the absence of class distinction in this country.

American workmen dress like other people and consider themselves the equal of other people including factory owners, coal operators, politicians and professors. This is the greatest country in the world for the workman and the only country where he drives his own automobile to work. And the prosperity of the American workman largely is the basis of our national prosperity.

ay "A-a-a-h" to Doctor for Health

Regular Attention to Physical Condition of Great Importance—Association to Encourage Examinations

By WILLIAM BUTTERWORTH
President, Deere & Company
Moline, Illinois
and
President, Illinois Association
for the
Promotion of Periodic Health
Examinations

SOME time ago I read a story, important enough to occupy a first page place in a leading metropolitan journal, about what a famous American man- cturer was doing to keep in good health attain a ripe old age.

Ie was Samuel M. Vauclain of Phila- phia, President of the Baldwin Loco- tive Works.

'I pay my physician so much a year for -ping me well," Mr. Vau- in said. "When I get sick pay stops. I don't have to rry; I let him do that. But m careful to obey his or- s. He examines me phy- ally at frequent intervals d tells me what I must do be saved."

Mr. Vauclain is doing the tural thing for a man of his pe and education. He is an gineer. He believes in go- over the human machine least as thoroughly as one uld have his motor car, or y other expensive piece of achinery, examined by an pert at regular intervals.

I think that one of the rea- ns there are so many healthy d strong elderly men among ir manufacturers, bankers d merchants is because they e doing what Mr. Vauclain s recommended. They are ving their human machinery amined and regulated. Their mily physician thumps their ests, makes them open their ouths and say a long "A-a- h," taps them on their knees r reflex action, takes their lood pressure, makes the nec- ssary trials for indication of right's disease or diabetes nd goes through the few other imple tests that tell him hether their organs are func- ioning properly—whether the uman machine, in other ords, is hitting on all six ylinders. Many lives are engthened—many men are pared for important work and he enjoyment of life that does not end fter one is fifty. Decrepitude is halted or many long years.

I don't know who first made regular hysical examinations fashionable among nen of affairs. I think it was the life in- urance companies. Possibly the good old amily physician had something to do with t. At all events, the practice is increasing nd is most beneficial.

William Butterworth

Now, if physicial examinations are good for men of affairs like Mr. Vauclain, they must be good for the rest of us. I have believed in them for years. They have been encouraged among the working force of the factory I represent. So, when I heard that I had been elected President of the Illinois Association for the Promotion of Periodic Health Examinations, I accepted the office because I favored the health reform movement, if you can call it that, and was willing to help.

If physical examinations are good for the rich man they are good for the poor man, who has just as much right as any one else to enjoy good health and old age. The trouble is the average man and woman puts off calling on a physician till the last minute. Then it is often too late. It's a good deal like making a will. Many people defer it as long as possible. They hate to do it; possibly they think they are going to die if they make their wills. And, I dare say, there are not a few persons who feel that if they have anything wrong with their interior mechanism they'd much better know nothing about it. That's where they're wrong. If one of their physical screws is loose, or something needs tightening, or oiling, or adjusting, it would be much better to know the nature of the trouble and fix it in time.

Under 2% See Doctor Regularly

A doctor told me the other day that for every sick person on their lists, the physicians had 100 well persons. This sounded encouraging until he added that many of the ones who thought their health was good had the germs of disease incubating in their systems, although preventive treatment would cure them. Out of the 110,000,000 population of the United States, I am informed only from 1½ to 2 per cent have medical attention once a year.

One of the diseases which is being successfully overcome by medical examinations and proper treatment before it is too late, is tuberculosis. The statement was made recently that should the declining rate in tuberculosis (which prevailed from 1900 to 1922) continue, the disease would disappear in 1955. Educational work in the treatment of tuberculosis certainly has paid large returns.

What has been done in tuberculosis we think can be done in the case of other diseases which are taking off so many of our people, such as diseases of the kidneys, heart disease, pneumonia, high blood pressure maladies and cancer. It is asserted by physicians that 70 per cent of cancer cases, if taken in time, can be cured by surgical operations. A report submitted recently at the annual meeting of life insurance presidents of New York showed, for last year, a death rate of 853.1 per 100,000 in the United States and Canada, compared with 834.5 in the corresponding period in 1922 and 828 in 1921. Influenza and pneumonia were among the chief causes of the increased number of deaths. Organic heart disease, cerebral hemorrhage and Bright's disease also showed increases. Decreases were noted in typhoid fever, tuberculosis and cancer.

American employers are interested in physical health examinations of their employes from a humanitarian point of view. But there is also quite an important economic consideration, for it is a serious interference with plant efficiency when workers have to lay down their tools on account of illness. The illness of a single worker frequently throws out of gear the entire team of which he may be an essential factor. Putting a green man to work on the team often may reduce the output as much as 20 per cent. If there are five men in a team, at the present rate of illness among workmen, there are approximately thirty-five days every year when one or the other members of the team is absent, cutting down the production of the team from 10 to 20 per cent during the thirty-five days. If the average loss per year for each worker were only five days, in place of seven, as it is now, it would mean saving millions of dollars to employers of the nation in increased efficiency.

One Manufacturer's Experience

A paper mill manufacturer with 600 employes, reports an interesting experience because of compensation claims which the Company felt were based on trouble originating prior to employment. Pleasant relations with their employes made it easy to get their acceptance of the plan.

A part-time physician conducts the tests, and records are made covering the following points: sex, color, marital status, age, weight, height, eyes, ears, nose, throat, teeth, gums, temperature, pulse, arteries, blood pressure, heart, lungs, abdomen, extremities, reflexes, urinalysis, and genito-urinary findings. Up to July 1, 1923, 547 applicants were examined and corrective treatments were prescribed in 154 cases. Among the defects discovered were fifty-five cases of hernia (36 being first degree, 7 second degree, and 12 third degree); thirty-two cases of venereal disease, thirteen cases of suspected tuberculosis, twenty-nine cases of pronounced diabetes, and twenty-seven cases of impacted wax in the ear. Of the 547 applicants, only two have been refused employment. The Company's policy is to place men at work for which they are best fitted by their physical capabilities and limitations. The applicants who needed treatment were told what to do in order to improve their condition.

Physical examinations should include regular examination of the teeth. It long has been known that neglect of teeth causes disease elsewhere, through infection. Over 100 years ago, Dr. Benjamin Rush, after whom Rush Medical College in Chicago was named, wrote a book on medical practice and in the first chapter cites many cases in which patients suffering from rheumatism and other maladies either were cured or greatly improved by the extraction of teeth. More than a century ago, in England, examination of the teeth of school children was considered a routine procedure.

Teeth of the average adults appear to have been neglected, judging from the evidence of 6,000 X-Ray pictures taken a few years ago of the mouths of 600 adults of the average age of 28 years. These pictures showed over 1,500 treated teeth and an average of 5½ teeth missing for each person. Allowing for a few who never had wisdom teeth, we might say than an average of four teeth for each person had been extracted because of neglect of cavities or decay. These same X-Ray pictures showed that 51 per cent of these 600 adults had infected areas at the ends of roots of one or more teeth, and 53 per cent had parts of the bone along the sides of the roots destroyed by the infective process known as pyorrhea. Of the entire 600, 78 per cent had one or the other or both types of infection.

Neglect of Teeth Serious

Nearly every leading physician will tell you that infections of the teeth are, by far, the most frequent causes of secondary infections elsewhere in the body. The lack of attention to the teeth of our children, and adults as well, is resulting in a series of disabilities which is without doubt cutting short the lives of many people.

The Illinois Association for the Promotion of Periodic Health Examinations hopes to educate the public to the need of looking after the body machinery before it is too late. The Board of Directors is composed of representatives of the American Red Cross, associations that are fighting tuberculosis, the United States Department of Labor, dental schools, a life insurance company, the Illinois State Department of Health, manufacturers and physicians. The only reward they hope to obtain is a better standard of health for the entire community in return for the time and labor they freely give to the cause.

Blanks for adequate physical examinations may be obtained from your family physician or from John M. Glenn, Secretary of the Illinois Association for the Promotion of Periodic Health Examinations, at 76 West Monroe Street, Chicago.

Water Shipping of Lumber Cut Into Railroad Revenue

If the lumber which moved by water in 1923 from the Pacific Northwest to the Atlantic Coast had gone by rail the railroads would have been the gainers by more than $18,000,000, and if the lumber which went to California by water from the same Northwest ports had gone by rail an additional gain of $22,000,000 might be added to railroad receipts. These estimates are on the basis of 65 cents per hundred pounds as the transcontinental rail rate and 40 cents as the rate to Southern California.

The Pacific Northwest established a new record in 1923 in the shipping of lumber by water, says a bulletin from the West Coast Lumberman's Association. The total of such shipments was 4,275,701,025 feet as compared with 3,402,316,969 for 1922, a gain of 25.7 per cent.

Waterway Meetings to Urge Lakes-to-Gulf Legislation

A series of river meetings starting in April, to be held in centrally-located cities on the Missouri, Mississippi, Illinois and Ohio Rivers to organize the Mississippi Valley waterway forces so they will function as a unit for pending legislation designed to secure the utilization of the inland waterways for navigation purposes is announced by the Mississippi Valley Association. The first of the series of meetings is to be held in Kansas City, Mo., April 11-12.

By the meetings the Mississippi Valley Association hopes to co-ordinate the waterway forces of the entire Mississippi Valley territory so that a united demand can be made of Congress for its favorable consideration of the annual Rivers and Harbors Appropriation Bill—the Newton Bill—which provides for the issuance by the Government of bonds in the amount of $73,000,000 to defray the cost of completing the navigation work on the Ohio, Mississippi and Missouri Rivers, and the pending legislation for the creation of a 9-foot channel in the Illinois River to form the connecting link in the Lakes-to-the-Gulf waterway.

Invitations to participate in the sessions of the district meetings will be extended by the Mississippi Valley Association to all organized trade and commercial bodies in various river districts. Plans designed to secure substantial community delegations to assure complete territory representation at each meeting will be formulated immediately by the Mississippi Valley Association.

Officials in charge of the Valley Association's activities in the various river districts are: Walter S. Dickey, Kansas City, Mo., Vice-President, Missouri River District; E. T. Harris, Chicago, Vice-President, Illinois River District; Walter Parker, New Orleans, La., Vice-President, Lower Mississippi River District; R. P. Warner, St. Paul, Minn., Upper Mississippi River District, and C. F. Richardson, Sturgis, Ky., Ohio River District.

Southern Pine Statistics

According to information contained in the February *Economics and Statistics Bulletin* of the Southern Pine Association, recently issued, of 2,132,429,000 feet of Southern pine lumber and timber shipped by 102 subscriber mills to forty-two states and Canada in 1923, the retail trade took 56.4 per cent, wholesale 31.8 per cent, railroads 7.1 per cent and the industrial trade 4.7 per cent.

Canadian Sales Tax Called Unsound[*]

New Revenue Law Cumbersome, Difficult to Enforce, Discriminates Against Manufacturers, Living Cost Up

By R. N. McCORMICK
Assistant Manager, Tariff Department, Canadian Manufacturers' Association

MANUFACTURERS and business men generally are daily becoming more and more interested in the matter of taxation, and it is right and proper t they should, because the success of ir business may depend upon the sound- s of taxation measures imposed by the ntry where their business is being car- d on. Unwise and ill-conceived meas- s of taxation may throttle industry.

The raising of revenue by means of a es tax is an unusual method, and Can- a is one of the few countries which have empted to balance their budget by means such a tax. Many other countries have vestigated the tax, but few have adopted as a part of their fiscal system. We ve been experimenting for over three ars with one form of sales tax. The Gov- nment has scrapped that form, and we w have another form which is called a les tax, and yet it is not a measure which ars very much resemblance to most of e forms of sales tax we hear discussed. the authorities decide that this one is t to their satisfaction, there are several her varieties of the genus sales tax that ay be tried. But we sincerely hope and ust that the Government will find it pos- ble to abandon this method of raising oney.

South Africa gave some consideration bout two years ago to a proposal to levy small sales tax but, owing to the opposi- on developed, it was abandoned. And it ight be of interest if I were to give you e reasons why the Congress of Chambers f Commerce of South Africa decided that uch a tax was not a good and proper meth- d of taxation. They passed a resolution aying that they were opposed in principle a sales tax for the following reasons:

> "First, the inequality of its incidence between e various classes of the community who will ay the tax, if it is not passed on at all, or only artly passed on to the consumer.
>
> "Second, the inequality of its incidence if it is holly passed on, when the poorer section of the ommunity who, to exist, spend all their earnings, vould be taxed to a disproportionate extent.
>
> "Third, the effect of a sales tax must be to in- rease the cost of living.
>
> "Fourth, the administration of a tax with many xemptions would be cumbersome and difficult n the extreme, and its control and collection vould involve heavy additional expenditure in utdoor and indoor staff."

The Present Sales Tax

The present so-called Sales Tax Law, which has been in force since the first of January of this year, is a radical departure from any well recognized form of sales tax. The Minister of Finance, when introducing this legislation in May last, made the following statement in explanation of why they were discarding the old method and introducing this new method:

"Last year we were obliged to increase the amount of the tax considerably.

"We must admit the tax is a burden, and apart from the amount of it, the form in which it has been imposed has given rise to very much discontent.

"Many good citizens who recognize that the Government needs money, and who are willing to pay their fair share of the taxes, object to the complexity of the sales tax."

And further on he stated:

"We propose that the tax shall be 6 per cent, and that it shall apply on the duty paid value, both of home made and imported goods.

"Stated in this way, the proposal seems a very simple one, and its purpose I think will have widespread public approval."

The tax, in the first instance, is 6 per cent on the sale price of all goods manufactured or produced in Canada, and 6 per cent on importations; but owing to the great many exceptions and provisos which have been worked into the law and into the regulations, the tax on domestic goods has become in effect a tax of 6 per cent on such articles as are manufactured in the condition in which they go to the consumer, and likewise 6 per cent on goods which are imported in the condition in which they go to the consumer.

Under the old law, the burden of the tax was spread over manufacturers and wholesalers, each bearing a portion of the burden. Under the new law, the burden will rest entirely on that class of manufacturers, limited in number, who are manufacturing goods in the condition in which they are consumed, such as manufacturers of clothing, furniture, household equipment, etc. In other words, the Government has in this measure selected a small group of manufacturers, who are to carry the burden of the tax, and has exempted all other manufacturers from any obligation, and has exempted the wholesale trade, with the exception of those few who will be licensed, to whom I will refer later. The manufacturer of semi-finished goods, whose materials pass to another manufacturer for remanufacture, is exempt from any obligation under the tax. He buys his raw material free of the tax, and he sells his product free of the tax.

I mentioned that there were many exceptions and provisos. Those exceptions, briefly, are as follows: That a licensed manufacturer can purchase or import any goods which are to be used by him in the re-manufacture of taxable goods, for sale, which are capable of being so used; likewise, the licensed wholesaler can purchase or import goods which are to be re-manufactured into other goods for sale. Sales to the Provincial Government for its own use and not for resale, are exempt, and goods exported are exempt. The licensed manufacturer is the manufacturer who manufactures or produces goods to the extent of $10,000 per annum. There is also the provision that a manufacturer who produces less than $10,000 worth may be required to take out a license, if he is using as his raw material a substantial portion of tax free goods. There will also be a class of licensees in the lumber business; manufacturers of lumber, wholesale dealers and retail dealers will be licensed under regulation issued by the Government.

Consider Purchases and Sales

The licensed manufacturer has to consider the sales tax in respect to his purchases and in respect to his sales. He has to consider those purchases which are nontaxable and those which are taxable—when he is entitled to purchase, tax free, he has to show his license number, and he has to give a certificate. When it comes to his sales, he has to determine what sales are taxable, and what sales are non-taxable, and when he comes to pay the tax to the Government at the end of the month, he has to determine upon what rate he is going to pay the Government. The rate is 6 per cent, but it is not always based on the same valuation. If they are goods of his own manufacture, he has to pay 6 per cent of the sale price. If they are goods manufactured by another manufacturer, he pays 6 per cent of his cost price. You will see at once that there will be many difficulties to be met and overcome in the application of this new tax.

Then there is the unlicensed manufacturer. If he purchases from a manufacturer who pays the tax, or if he imports, he pays the tax; but he does not pay any tax on what he sells. The licensed wholesaler I have referred to, will be the wholesaler whose business chiefly consists of selling raw material to manufacturers, and in order to avoid the detail which would be involved in the making of refund claims and the checking of them and refunding the tax paid, they are prepared to license any wholesaler, 50 per cent or more of whose sales are to manufacturers.

Now, the unlicensed wholesaler will represent the vast majority of wholesalers, because there will be very few wholesalers who will be able to qualify for a license.

---

[*] (Abstract of address before 4th Tax Congress, Illinois Manufacturers' Costs Association.)

The Government is throwing away 2¼ per cent sales tax on all goods on hand on the shelves of the wholesalers throughout the Dominion, for the reason that those goods became tax-exempt on the first day of January, and the wholesalers do not collect any tax on their sales.

Manufacturers Are Worried

There is one feature of the new law which is giving a great deal of concern to the manufacturers. That is the provision that any tax which was paid by them on goods on hand at the end of the year, and which goods are to be re-manufactured, or which have been re-manufactured, they may recover. That was necessary in order to put them on an equal footing with manufacturers who would be buying their raw material after the first of the year.

There are also special provisions made in respect of lumber, whereby the tax is paid on the final sale to non-licensees. The lumber industry asked that special provision be made for lumber, but no provision is incorporated in the law, and the Government found it necessary to make some special provision, so they evolved a scheme whereby every lumber dealer, whether retailer, wholesaler or manufacturer, should be licensed and should be entitled to purchase lumber tax free on condition that if sold to an unlicensed person, he would account for the sales tax.

It has been found necessary by the Department to make many concessions, due to the fact that the strict application of the law is not feasible. The sales tax, as we have it now in Canada, is not a sound system of taxation. There is that selected group of manufacturers I have referred to, who have to bear the burden. If a manufacturer is selling his product on long term credit, he has, nevertheless, if his commodity is taxable, to pay the Government 6 per cent on his sales at the time of the sale, though he may not receive any return for his goods for six months, nine months or twelve months.

There is also the manufacturer selling to a retailer on a taxable article, having to account for 6 per cent on $100. The manufacturer selling through the wholesaler, or the wholesale trade, will only have to account, if the discount is 20 per cent, for 6 per cent on $80. At once the manufacturer selling to the retailer is at a disadvantage.

These taxes have increased the cost of living in Canada. Building costs, manufacturing costs, cost of equipping factories, etc., have been raised accordingly. It has discouraged expansion and checked immigration. Take the case of a farmer settling on land out on the prairie. He has to pay a tax of 6 per cent on all material he uses in the erection of his house, his barn, and his granary, on his implements and harness, his household equipment and furniture, his clothing, and on certain of his foods, before he receives any return from his crops.

We believe that the tax, as a method of raising revenue, is economically unsound,

(Continued on page 15)

U. S. Manufactured Products Exempted Under New Canadian Sales Tax Law

THE Canadian Sales Tax, in force since the beginning of the present year, is of great importance to manufacturers and shippers of the United States who are interested in trade in the Dominion. The Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce, has compiled a list of products exempted from payment of that tax, as provided in the Canadian regulations, which is published herewith:

Articles of food, animals, poultry, grains and seeds, foodstuffs, and similar products:

Alfalfa meal
Animals (living)
Barley meal
Bees
Bran
Bread
Buckwheat meal
Butter
Butterine substitutes; materials for use solely in the manufacture of butterine substitutes.
Cheese
Chicory, raw or green
Coffee beans, green, not roasted, exempt as seeds in their natural state.
Cornmeal
Cream
Dried beet pulp
Eggs
Farm produce sold by the individual farmer of his own production.
Fertilizers
Fish and products thereof, not canned or medicated.
Flour, including self-raising flour.
Fruits
Grains, mixed or crushed, for cattle or poultry feed. (Note.—Cattle and poultry feeds which contain ingredients other than grains, mixed or crushed, are subject to the sales tax).
Grains in their natural state
Hay
Honey
Hops
Ice
Jams
Jellies
Lard, lard compound, and similar substances made from animal or vegetable stearine or oils; materials for use solely in the manufacture of lard substitutes
Lentil seeds in their natural state.
Maple syrup
Margarine
Materials for use solely in the manufacture of oleomargarine or any substitutes for butter or lard.
Marmalade
Meats, fresh
Middlings
Milk
  Buttermilk
  Condensed milk
  Evaporated milk
  Powdered
  (Note—Allenbury's milk foods Nos. 1 and 2 not entitled to exemption from sales tax as powdered milk.)
Molasses
Oatmeal
Oil cake
Oil cake meal
Oleomargarine; materials for use solely in the manufacture of oleomargarine.
Pea meal
Poultry (fresh)
Poultry (live)
Rolled oats
Rolled wheat
Salt
Seeds in their natural state.
Shorts
Straw
Sugar
Syrups and molasses of all kinds, the product of the sugar cane or beet not specified, and all imitations or substitutes therefor.
Vegetables.

Miscellaneous:

Advertising matter, if sent by mail and if duty is prepaid by means of customs duty stamps; otherwise, advertising matter is subject to the tax.
Articles imported for the use of the Governor-General.
Articles imported for the personal or official use of Consuls General who are natives or citizens of the country they represent, and who are not engaged in any other business or profession.
Artificial eyes
Artificial limbs and parts thereof.
Bibles
Boats bona fide purchased by, and articles and materials used in the manufacture of boats bona fide built for, individual fishermen for their own personal use in the fisheries.
Calcium carbide.
Canadian returned goods.
Coal
Coin, British and Canadian
Coin, foreign gold
Donations of clothing and books for charitable purposes.
(Note—Gifts or donations of articles, and also articles not intended for sale upon which the duty exceeds $1, are subject to the sales tax unless such articles are included in the list of exemptions.)
Drain tiles for agricultural purposes.
Electricity
Eyes, artificial
Fence posts
Fiber for use only in the manufacture binder twine.
Fish hooks, for deep-sea or lake fishing, lines, twines, threads, nets, ropes for nets, and similar articles enumerated Tariff Item 682 of the Canadian tariff.
Fuel of all kinds
Furs, raw
Gas manufactured from coal, calcium or carbide, or oil, for illuminating or heating purposes.
Gifts (see donations).
Gold and silver, in ingots, blocks, bars, drops sheets or plates, unmanufactured.
Hymn books
Limbs, artificial, and parts thereof.
Literary papers, weekly, unbound.
Logs
Magazines, monthly and semi-monthly.
Manila fiber for use only in the manufacture of rope, not exceeding 1½ inches in circumference for the fisheries.
Manuscripts.
Materials for use only in the construction equipment and repair of ships.
Memorials and monuments erected in the memory of soldiers who fell in the Great War.
Missals
Newspapers and quarterlies.
Nursery stock
Ores of metals of all kinds
Prayer books
Psalm books
Pulpwood
Radium
Railway ties (not classed as lumber for purposes of collecting sales tax).
Religious tracts
Samples
Shavings and sawdust, being waste products, classed with "fuel of all kinds" and exempt from sales tax.
Ships, materials for use only in the construction, equipment and repair of ships.
Ships licensed to engage in the Canadian coasting trade. (Note—Imported materials included in "ships' stores" will be delivered from customs bond free of sales tax.)
Sunday School lesson pictures.
Tan bark and other articles, the product of the forest when produced and sold by the individual settler or farmer.
Timber, round, unmanufactured.
Tobacco, raw leaf; where transferred in bond from customs to excise warehouse, the sales tax is only payable when exwarehoused for duty.
War veterans' badges
Wool not further prepared than washed.

Additions to list of Goods Exempted from Canadian Sales Tax:

Usual coverings to be used exclusively for covering goods not subject to the consumption or sales tax.
Materials to be used exclusively in the manufacture of usual coverings to be used for coverings for goods not subject to the consumption or sales tax.
Woolen rolls or wool yarn milled for a producer of wool from such wool supplied by him for his own use.
Articles admitted free of duty under Tariff Item 692:
Cabinets of coins; collections of medals and collections of postage stamps; medals of gold, silver, or copper, and other metallic articles actually bestowed as trophies or prizes and received and accepted as honorary distinctions, and cups or other metallic prizes (not usual merchantable commodities) won in bona fide competitions.
Articles included in Tariff Item 139:
Glucose or grape sugar, glucose syrup and corn syrup, or any syrups containing an admixture thereof.
Bakers' cakes and pies, not including biscuits.
Reduction in tax on Printing Paper:
The rate of the tax on printing paper for use exclusively in producing newspapers and quarterly, monthly and semi-monthly magazines, weekly literary papers unbound, hymn-books, religious tracts and Sunday School lesson pictures is reduced by 50 per cent on the amount of the consumption or sales tax.

The Governor in Council is empowered under the Sales Tax Law to add to the list from time to time.

Illinois Bankers' Convention

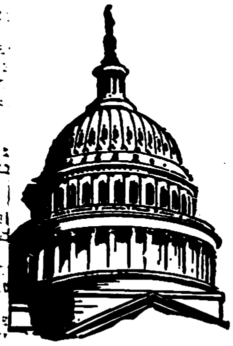
The annual convention of the Illinois Bankers' Association will be held at Decatur, Ill., June 19 and 20.

Congress Is On Trial Before Nation

Dilatory Legislative Tactics and Failure to Pass Immediate Tax Reduction Must Be Justified to Public

By JOHN M. TOWNSEND

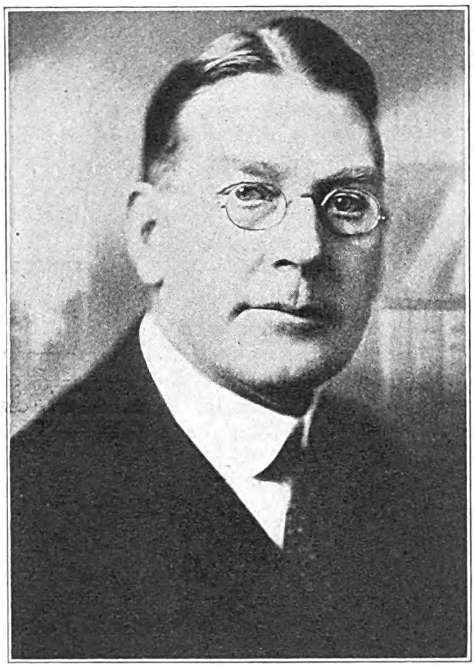
Washington Correspondent,
Manufacturers News



Washington, D. C., Mar. 19.—When Congress at behest of the President, refuses to grant a reduction of 25 per cent to income taxpayers, although everybody favors it and when the surlus in the Treasury warrants it, the politcal situation in Washington can readily e recognized as at its lowest ebb. Vetrans around Washington know that Conress can—if it makes up its mind—o anything within its province quickly and well. This Congress has set itself delibrately to play politics and the Democrats are bound to play politics with the Tax Bill to the last ditch in the hope that they can force President Coolidge to surrender on the Mellon Plan and sign a bill of their making.

INHERITED TROUBLES — Although President Coolidge has been on the job for nearly eight months, all of his real troubles to date have been inherited ones. He inherited a new Congress elected at the election a year ago, which was plainly constituted to make even more political trouble for Warren G. Harding than it has made for him. To date, the Democrats, in all of their investigations and political speeches, have merely been trying to "get something on" Calvin Coolidge while, at the same time, exposing the shortcomings of the Harding Administration. President Coolidge inherited the Naval Oil scandal and he inherited Harry Daugherty and all of the other chief topics of political investigation and conversation. He also inherited the surplus in the Treasury and his method of disposing of it was the method Warren G. Harding had in mind, namely, tax reduction. He inherited the depression in the agricultural sections of the West and South, some of which have improved and none of which can improve permanently until foreign markets are restored. He inherited the Merchant Marine problem and the Veterans' Bureau scandal. If the President had the co-operation of a Congress which was willing to work, he might be able to liquidate some of these assets or liabilities, as the case may be, and make some real progress toward normalcy again. Until this political cyclone blows over, however, he can do little but stand his ground and administer the executive affairs of the Government as best he can.

CONGRESS ON TRIAL—By reason of its large membership and divided responsibility and the nature of the business before Congress, members of Congress, regardless of party, have heretofore usually escaped personal responsibility for the shortcomings of that body when election time came around. The failure of this Congress, however, to vote a prompt reduction in tax payments this year, when there was no real excuse for such delay, has hit the pocketbooks of so many voters that there is a chance these voters, this Fall, will take some of these Congressmen to task for their premeditated opposition. While the Democrats in Congress are playing politics with every angle of the tax reduction legislation, particularly in the House, in the hope that, eventually, a Democratic tax reduction bill will be enacted, the opposition of that party to quick and reasonable tax legislation is, in fact, particularly jeopardizing many Democratic House seats gained at the last Congressional election. It is not often that Congress is called upon to take a direct crack at the pocketbooks of the country, but in the refusal of the House to consider an immediate reduction of this year's taxes, the dividing line between the President and his Administration and Congress has been made especially clear. Furthermore, the dilatory legislative tactics in both houses, the penchant for investigation at heavy cost to the taxpayers and the kind and nature of the investigations, have centered public attention upon Congress as it has not been since the days of Cannon.



P. & A. Photo

HON. CURTIS D. WILBUR

The New Secretary of the Navy, Former Chief Justice of California's Supreme Court, Who Succeeded Edwin Denby

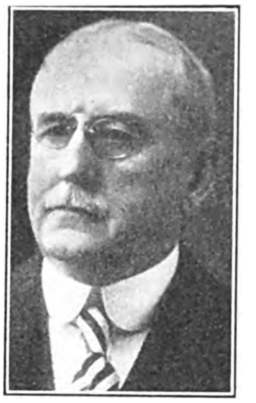
THE LAFOLLETTE GAME — Senator Robert M. LaFollette, according to his close friends, will not make a nation-wide presidential contest this year. He has neither the health nor the strength to make such a fight and there is not a favorable outlook for the success of a third party presidential candidate. Therefore, there is no financial backing for it. On the contrary, Senator LaFollette proposes to continue to play for control of a "balance of power," not only in the Senate and House, which he and his followers now have, but in the presidential contest as well. To this end, the prediction is heard here that Senator LaFollette will be "independent" in the elections this year and, while being represented in the Republican National Convention, as usual, he will devote his energies primarily to the election to the Senate and House of both Democrats and Republicans who will cooperate with his group as a third party on legislation. If it is necessary to do so to help this plan along, Senator LaFollette may permit his name to be used as a presidential candidate in a few states, but he cannot make a nation-wide campaign for the presidency. It is further hoped by his followers that if his presidential candidacy is confined to a few states it may be possible to carry them and thereby establish a "balance of power" in the Electoral College itself, which will throw the election of the next president into the House of Representatives. The Democrats are beginning to awaken to the danger that LaFollette, while playing his own game in his own way, may prevent them from carrying some of the discontented Western states this year and that, in any event, should they win the election, he and his group will still be a thorn in the side of the dominant party.

HOPEFUL OUTLOOK AHEAD—If the Dawes Committee, which is now working on a plan for economic stabilization of Europe, can develop some plan whereby the economic restoration of Germany can be established on a permanent basis, there is real hope of an early settlement of the reparations problem and consequent economic revival throughout the whole world. The absolute collapse of the German currency system has, in effect, wiped out the whole of the internal debt of Germany and, thereby, made possible the imposition of a foreign debt in its stead. The recent collapse of the French franc has brought France to the realization that if some safe and sane reparations settlement is not quickly reached, France will follow in the path of Germany. The situation could not be better for the purposes of a fair-minded, well-informed international committee than now, and the French loan of $100,000,000 made in New York this week may be taken as indicative of the optimism in Paris over the prospect of an early settlement. In a general way, the Committee appears to be planning to impose on Germany a reparations debt approximating that of the war debt of one of its leading antagonists in the late war. It is manifest that payments on this debt can be made by direct taxes, by trade balances and by payments in kind. It is also manifest that if direct tax payments are removed from Germany too rapidly the currency problem will arise again and it is more or less dubious as to the amount of trade balances the interested governments will permit. Payments in kind will not only serve the purpose of paying reparations, but will keep enough new money in Germany to save the currency problem, leaving further cash payments to be made at a time when it is safe to take cash out of the country. This is the real problem before the Committee, but the outlook for reducing this problem to a negotiable basis, under the circumstances, is good. Any real settlement of this problem will reflect itself favorably in many ways, including a relaxation in the strangle hold which has kept Europe buying food, clothing and other necessaries on a hand-to-mouth basis, often below real requirements, ever since the war.

DAUGHERTY GOES SOON—Attorney-General H. M. Daugherty may retire from office any day. Washington is convinced that Mr. Daugherty will not remain in office beyond April 15, at the latest, and it would not be surprised if he retired much sooner. The Senate investigation, just begun, is apparently to be a long-drawn out affair instead of an expeditious investigation of the actual conduct of the Department. The extraneous character of the evidence thus far taken means that Mr. Daugherty and his lawyers will be kept busy preparing a defense on matters which have no proper place in such an investigation and which were not anticipated. The whole question of Mr. Daugherty's retirement hangs on the ability of Mr. Daugherty to defend himself and, at the same time, run his Department, which is one of the busiest in the whole government these days. While giving Daugherty a square deal, the President must also give the Government a square deal and that problem is a real one.

SECRETARY OF THE NAVY — Hon. Curtis D. Wilbur, Chief Justice of the Supreme Court of California, has accepted the invitation of President Coolidge to take over the Navy portfolio, resigned by Edwin Denby. The President first offered the Cabinet position to Federal Judge Kenyon, former U. S. Senator from Iowa, but the Judge frankly advised the President that he did not consider himself qualified to handle the Navy. Judge Wilbur's resignation from the Supreme bench in California will not be tendered Governor Richardson until his appointment has been confirmed by the Senate. This was done yesterday.

James Brown, Stock Yards' Veteran, Retires After 35 Years of Service



James Brown

James Brown, who for the past twenty-eight years has been Head Cattle Buyer for Armour & Company, will retire on a pension on April 1. Due to the pressure of Mr. Brown's personal business, which has grown rapidly in the last few years, he has decided to devote his entire time to his Illinois stock farms.

Mr. Brown first came to Chicago in 1889, and entered into partnership in the commission firm of Ward & Brown as a cattle salesman. His work proved of such a nature during the five years that he was a member of this firm, that J. Ogden Armour secured him for the Cattle Buying Department of Armour & Company.

Credit for establishing the first tile factory to be operated in Illinois outside of the White Hall District must be given to Mr. Brown. The adventure was a decided success. Many people in the Southern part of the State also remember when Mr. Brown took over the management of an elevator near Springfield, which was another successful undertaking. After three or four years he went West, and in the Spring of 1880, located at Buffalo, Wyo., near Fort McKinney, where he obtained ranching property.

Mr. Brown is now the owner of extensive stock farms located near Dundee and Elgin in Illinois. His cattle herd in recent years has averaged about seventy-five head, and he has been noted for raising some very satisfactory animals.

In June, 1919, he sold his herd down to very limited numbers, but now that he is giving up his active participation in cattle buying at the Stock Yards, he intends to rebuild his herd with animals of the best pedigrees he can secure.

Mr. Brown has been a Director of the International Live Stock Show from the earliest years. His acquaintance among the cattlemen of America is rivalled by few, and his career furnishes a challenge to every young man who must overcome apparently insurmountable obstacles.

A dinner commemorating his long and valued service to Armour & Company and to the whole live stock industry was recently given at the Chicago Club by several of Mr. Brown's intimate friends. Kay Wood acted as Toastmaster, and among the prominent men who attended and gave short talks were F. Edson White, President of Armour & Company; P. D. Armour, First Vice-President, and John Clay, head of the commission firm bearing his name.

Mr. Brown's position will be filled by Tom Cross, who has been Assistant Head Cattle Buyer for Armour & Company for over fifteen years. Mr. Cross started his career with the Hammond Packing Company of Chicago, which was later known as the National Packing Company. He served in the capacity of Head Buyer for that firm until it was dissolved. He then went with Clay, Robinson & Company, selling cattle, which position he held until he entered the employ of Armour & Company. Mr. Cross is well known throughout the Stock Yards, and his many friends heartily endorse his promotion.

A. H. Harris May Succeed A. H. Smith as N. Y. C. Head

Albert Hall Harris, Vice-President in charge of Corporate Relations, is said to be slated to succeed the late Alfred H. Smith as President of the New York Central Railroad. Mr. Smith was killed on March 8 by being thrown from his horse while riding in Central Park, New York City. Final selection of Mr. Harris as the new head of the road is said to await word from George F. Baker, the aged New York financier, head of the First National Bank of New York City and one of the leading stockholders in the New York Central lines.

Charles H. Markham, of the Illinois Central, is also mentioned for the place.

Mr. Harris was born in Rochester, N. Y., sixty-two years ago, became a lawyer and in the early '90's entered the service of the New York Central. He has wide railroad and banking interests. Mr. Harris is Vice-President of the New York Central & Hudson River Railroad Company, the parent corporation, and has been Vice-President of the Michigan Central, Big Four, Pittsburgh & Lake Erie, and other subsidiaries of the New York Central.

Mr. Harris has been designated, according to reports from New York, because of his specialty in railroad financing and therefore is better qualified to carry out the plans projected by Mr. Smith for extending another main line West and taking over the Central Railroad of New Jersey and part of the Philadelphia & Reading.

Artificial Silk Mill in Canada

Erection of the first artificial silk factory in Canada, at a cost of more than $1,000,000, will soon be undertaken near Cornwall, Ont., according to an announcement by Cortaulds, Ltd., of London, England, said to be the largest manufacturers of artificial silk in the world. The Company has purchased 240 acres of land on the St. Lawrence River as a site for the factory, and building operations, it is expected, will begin in the next few weeks. The new business will employ 500 people at the outset.

Corporate Financing Since the War*

Orderly Methods Saved Many Concerns from Disaster; Effect of Huge Influx of European Gold Into the U. S.

By L. L. DALY
Daly & Seddon Company,
St. Louis, Mo.

CORPORATE finance is a pretty dry subject. I might say in that connection that our country has been somewhat backward, especially in the produc- n of books or literature on corporate ance. There have been volumes written municipal finance, etc., but we have y few books which have been written out "Corporate Finance." There was a son, due I think, to the actual conditions at confronted us in this country previous 1914, and the tremendous amount of fi- ncial history we actually created during at period. As a matter of fact, in the last years we have made more financial story in this country than we did in the enty-five years or longer previous to 14.

To get back to that period, or to de- ribe briefly that period, it must be remembered that we are a very young coun- y, and that most of our early capital quirements for development of railroads d larger industrial corporations came om abroad. We looked to Europe to pply us with the capital to develop our untry. As a consequence, we had prob- ly borrowed from Europe, up to 1914, proximately $6,000,000,000, which was st in the form of bonds—railroad, in- ustrial, etc. We had no Federal Reserve ystem and our currency was bond-secured rrency—a very inelastic affair. The war oke out in 1914, and that was really the eginning of our greatest financial de- lopment.

With the war there came a sort of par- lysis of trade in this country. It was enerally believed our foreign trade would ome to an end and that we would go into nancial and industrial depression, which e did.

Strange as it may seem, conditions began o change very quickly. It was not long efore there came a demand for everything e could supply, including foodstuffs, aw materials, etc. As a consequence our ndustrial activity began, and as it grew we ound a great quantity of liquid wealth egan to flow into America in the form of gold. Our gold supply at that time was a ittle over $1,000,000,000; not a large supply as compared with the other nations of he world. But as the demand for these materials increased the gold continued to low into this country and it came in very arge amounts. In 1915 and 1916 almost $2,000,000,000 of gold flowed into America.

Our Federal Reserve System, formed in 1913, changed our currency from a bond-secured currency to an asset-secured currency and created a tremendous reservoir of credit.

As a consequence of this tremendous flow of gold into the country and as the demand from Europe continued, it was found necessary over there to mobilize the American securities which had been sold to them at high prices, by making them exchange with the holders of those securities for war loans in which they invested. As that mobilization went on they accumulated almost $4,000,000,000 of American securities which had been sold over there. They brought them over here and offered them to us, and we purchased those American securities from those people at fifteen and twenty points below the prices they had paid us for them.

Finally the situation became acute. By that I mean that there is a limit to the supply of gold in the world. I believe it is placed at about $8,000,000,000. England and France realized their own credit systems would be seriously impaired if this flow of gold continued. Therefore, it was necessary to resort to some other measure. They had gathered in all the securities available; they sent over $2,000,000,000 in gold, yet the demand continued—the need of liquid capital and the need of materials. So they sought some other method and the result was a Joint Commission was formed, called the Anglo-French Commission, consisting of representatives of the Treasury Departments of France and England. The Commission came to this country for the purpose of negotiating a billion dollar credit.

An Epoch-Making Period

Remember, that was in October, 1915. It was an epoch-making period, because up to October, 1915, this country had never purchased a foreign loan—with the exception of two small loans to Mexico and to Cuba. The negotiations went on for a period of months, the discussions waxed pretty harsh. After months of negotiations the American bankers considered such a loan or credit out of the question. They said it couldn't be done; that the American people knew nothing of foreign peoples; that we couldn't sell the loan. Finally, they agreed to float a $500,000,000 credit as a joint obligation of England and France, to be known as the Anglo-French loan, for a period of five years, with interest at 5 per cent.

Those of us who were in the business at that time and were in daily touch with the situation soon realized that the Anglo-French credit, as far as America was concerned, was a failure. In other words we couldn't sell it. Those countries were at war and might lose; consequently the investor wouldn't risk his capital. Heroic measures were resorted to, to sell that credit to American people. You would approach the American banker and explain that this credit was provided to give England and France half a billion dollars to purchase the wheat and corn raised in his section; but even with those points, and all the arguments you might advance, he wasn't in favor of it.

The distribution of that credit was made, in a large measure, by the big munition manufacturers, the packers, and those engaged in sending war supplies abroad. In turn, many of those munition makers and makers of war supplies distributed the Anglo-French credit in the form of dividends to their stockholders. That was our first introduction to foreign finance.

That was followed by a series of other loans. It was soon recognized that to simply put out a note which was a general obligation of this country was not a good thing for the American investor. He was a little too skeptical; so, it was realized in Europe that they would have to send over a little security to be placed on their notes, "secured by collateral deposit of bonds and stocks." Accordingly, they accumulated all the bonds of neutral countries like Norway, Sweden, the Suez Canal, and South America, brought them over here and deposited them with American institutions.

The individual investor in America did not buy, but the American banker recognized the value of that note and purchased it and, as a consequence, during that period we sold in this country about $2,000,000,000 short-term notes, secured by this collateral.

Beginning of Prosperity

When you take into account that we have, or had at that time, an inflow of $2,000,000,000 of gold; that we purchased $4,000,000,000 of American securities, and that we had extended this credit to England and France, secured by these collaterals, of nearly $2,000,000,000, it will give you a fair idea of the tremendous flow of liquid wealth which came into America and which was exchanged, as it were, for our use. That was really, as I interpret it, the beginning of our prosperity, and you might say of the era of industrial expansion through which we have passed.

Finally in 1917 we entered the war, and the American Government virtually assumed the financing, not only as far as we were concerned, but also the burden of financing France and England. On the note of France and England we extended credit, as credit was needed, to purchase war supplies and munitions. During that period we extended credit to those countries engaged in the war, the huge sum of $9,500,000,000. They owe us today $9,500,000,000 with the interest which has accumulated, close to $11,000,000,000.

---

*Abstract of address delivered before Southern Division, Illinois Manufacturers' Costs Association.)

At the close of the war in 1918 it was believed that our industrial activity had come to an end, that the demand for war supplies was over, that those countries would revert to a peace basis and we would go back to our old position. However, we shortly discovered that was not the situation. We found there was a great demand for the things that are used in our peaceful pursuits; that there was a shortage of everything used in our peaceful lives, and as a consequence, a huge demand sprang up almost overnight. That was the beginning of our industrial activity on what might be called a peace basis.

Prices began to advance at a tremendous rate. While they were going up, inventory values were being increased; so were property values.

Corporations Became Reckless

That's where the abuses crept in. On account of money being plentiful, making prices high, we found many corporations became reckless, and began to capitalize, not so much their increased wealth as their increased values. I don't say all corporations, or we would be in a bad way, but many did do it that way. As a result there was a huge demand for capital. Prices were going up, short-term and long-term credits were in demand, and we began to feel a strain on the Federal Reserve System. The gold reserve was down to 40 per cent, the point of caution. It can go below 40 per cent but that is recognized as the point of caution. Many of the regional banks were obliged to re-discount their own security in other districts. In addition, we were in what was probably the greatest era of speculation we had ever experienced. The stock market was running riot. The banking business ran into loans and finally it became necessary to bring pressure—by the Federal Reserve and in turn by the banks—to bear on the corporations to control credit.

First it was on the automobile industry and that was followed by other industries. There was a curtailment of dealing on the Stock Exchange. As this credit pressure continued we found a slumping of prices, commodity prices breaking about 25 per cent in a period of ninety days, an unheard-of rate. As a consequence of that shrinkage in inventory values there were huge losses sustained. There was hardly a corporation that went through unscathed. Virtually all had to accept huge inventory shrinkages and losses. Corporations were borrowing from their banks as high as they could go when they were overtaken by this tremendous drop in prices—these tremendous losses. Many corporations were virtually in the hands of their banks.

Gold Still Flows to U. S.

While this credit curtailment went on, gold was still flowing in from Europe, after 1920 over $11,000,000,000 flowed into this country and, in a great measure, helped to relieve this tremendous credit strain. As the flow of gold and the credit curtailment continued, we found this elastic Reserve System began to rebound—values began to go up; business was going back; less money was being used; prices were going down and we noticed quite a difference in the prices of long-term securities, which now came into demand. As the interest rate on those securities came down it opened an avenue for corporations to finance themselves, taking their bank losses out of the bank, taking over their short-term credit by pledging their fixed assets, and cutting out their long-term securities.

Many corporations that had sustained losses put out long-term bonds taking up their short-term paper and, as a consequence, capitalizing these losses. This is in a general way the condition that confronted us in what I would call inflated capitalization. Many corporations did have inflated capitalization, or capitalization of losses. They can probably work out this system and eventually become sound, if given a long enough period under high prices. However, will those prices prevail?

Examples of Reckless Financing

Now, for those that took advantage of the increase in prices and reckless credit, we have a concrete example in the Good-

Four Roads to Unity

By DR. FRANK CRANE

EVENTUALLY the clash between the laborer and the employer and even the clash between rival nations will be settled by the simple human process of getting acquainted.

The one cure for War, which is always a struggle between artificial divisions of mankind, whether these divisions are political or social, is the realization of our common humanity.

Anybody acquainted with history knows very well that no great issue wherein vast numbers of men were engaged upon opposite sides has ever been settled by one side gaining an entire victory over the other. Permanent settlement has always come by the two sides reaching an understanding one with the other.

The means of getting acquainted and getting together are simple. It is not a complex problem. It is just a plain human problem which requires heart and purpose. There are four great means of getting together.

First, eating. This is the essence of holy communion. It means recognition of the humanities. There are hundreds of business concerns where the workers do not even know the name and face of the chairman of the company or anyone higher than the works manager. This is a calamity. Non-acquaintance always makes trouble.

Directors, presidents and other high bosses ought to eat regularly with their men. Nothing we can do is so humanizing as eating.

Second, work. Work together. Cut out all this talk of employer and employes. Emphasize the word "co-worker."

Third, play. Play together. Find some sort of amusement in which the laugh of a Judge Gary can mingle with the laugh of the coal heaver in his steel mills, even if it is only at a movie show.

Fourth, patriotism. March together. Keep step. Our country is the one unifying appeal. We may differ about our religious creeds and political parties but we are all common children of the Fatherland. Don't neglect to celebrate the national fetes in some way that shall emphasize our common humanity. We are brothers under the skin. And it is only in making this truth prominent that we shall solve our problems.

TRANSPORTATION

157 Steam Roads Operating Motor Rail Coaches in Passenger Service—Canadian National Tries Steel Cars

WHILE only forty railroads were listed last year as operating motor rail coaches, a compilation made on Jan. 1, 1924, shows a total of 157, or an apparent increase of about 400 per cent. These figures indicate that the railroads of the country are not only using the motor coach in an experimental way, but many have already found it practical and economical, according to the National Automobile Chamber of Commerce.

Among the latter is numbered the New York, New Haven & Hartford Railroad, which began a test of the motor rail coach about two years ago. Three such coaches, each accommodating thirty persons and providing space for 1,000 pounds of baggage, were placed in service. As a result of the success of this venture, a larger type of gasoline propelled vehicle, providing accommodations for sixty passengers and 2,000 pounds of baggage was also placed in service. This is propelled by a 120 horse power 6-cylinder motor.

This larger unit has proved its worth so thoroughly that the New Haven Road has recently ordered ten new units of the same type.

A significant experiment with another high powered motor coach was begun recently by the Canadian National Railroad. This new rail motor coach is driven by a 225 horse power gasoline engine, seats fifty-five passengers and has a baggage compartment over 15 feet long. The coach has a steel body differing from most rail motor coaches which generally have bodies built on a standard motor bus style. The car weighs between 40,000 and 45,000 pounds.

A review of five years of electrical operation on the Rocky Mountain divisions of the Chicago, Milwaukee & St. Paul Railroad has been made by J. H. Rosenstock, Master of Transportation of the General Electric Company, for the American Association of Railroad Superintendents. He brings out the importance of regenerative braking with electrical locomotives, showing that the amount of power regenerated, or put back into the power transmission line has been found to be 11 per cent of the total power used, measured at the locomotive.

The work formerly performed by 112 steam locomotives has been successfully handled by 44 electric locomotives, he says. The steam locomotive made a run of 110 miles, while the electrics make a run of 220 miles, with a change of crew at the end of the first 110 miles.

Class I Roads Earn 4.54%

Net Railway operating income of Class I railroads for January amounted to $51,281,200 or at an annual rate of 4.54 per cent on their tentative valuation, compared with $61,128,970 or 5.58 per cent for the same month last year. January gross was $468,976,600, a decrease of $33,565,250 or 6.7 per cent from January of last year, while expenses were $384,981,380, a reduction of $23,993,100 or 5.9 per cent. Taxes during January, 1924, according to a report by the Bureau of Railway Economics, amounted to $26,000,000, both state and Federal, or about $867,000 a day. This was an increase of about 1½ per cent over taxes of a year ago. Maintenance of equipment expenses were reduced by $12,700,000 from last year while for maintenance of way and structure the increase was $2,423,000.

Railroads Devil's Device, Says School Board

TWENTIETH century civilization would scarcely care to go back to the days when railroads and the telegraph were unknown. But times change, you know, and a century ago these two great aids to present-day business were not so highly regarded. William Butterworth, President of Deere & Company, Moline, Illinois, has sent to MANUFACTURERS NEWS an item of "days gone by" that, in the light of our more modern ways of thinking, is both unique and interesting.

It is entitled "Railroads and Telegraphs in 1826," and the original of this paragraph is said to be in the possession of a Mr. Wells, of Wellsville, O. It was written in 1826 in response to a request for the use of a school house for a debate on "Resolved, That Railroads and Telegraphs Will Prove an Asset to a Young and Growing Country." Here is the reply of the School Directors:

> **"You are welcome to the use of the school house for the debate of any proper question, but railroads and telegraphs are rank impossibilities. If God had intended His human creatures to fly over the ground at the rapid rate of fifteen miles an hour He would have clearly foretold it in His Holy prophets. Railroads and telegraphs are devices of Satan to lead immortal souls to Hell.**
>
> **THE SCHOOL BOARD."**

C. N. R. Equipment Orders

With the placing of a large order for freight and passenger car equipment for use on the Canadian lines of the System, the Canadian National Railways are preparing for the Summer and Autumn traffic which, it is expected, will break all records this year. The order calls for the building of 1,000 sixty-ton box cars, 150 fifty-ton convertible ballast cars, fifty cabooses, 500 general service cars, twenty all steel baggage cars, twenty all steel first class passenger coaches and fifteen all steel mail and express cars. Every piece of equipment will be built in Canadian plants.

S. P. Ry. Employes Insured

More than 31,800 employes of the Southern Pacific Company, or approximately 85 per cent of the carrier's total payroll, have taken out insurance under the Southern Pacific Company's group plan which went into effect Jan. 1, 1924, according to William Sproule, President of the road. At the same time thousands of these workers, who had been one year or more in the road's service have applied for substantial amounts, in addition to the $500 free insurance allowed, at rate much lower than commercial levels.

To Cut Equipment Costs

New equipment orders on railroads in the Northwest will be cut to the bone this year as the result of the policy of retrenchment already in effect and the improvements made last year. The Great Northern, the Northern Pacific and the Chicago, Burlington & Quincy, it is said, will not be in the market during 1924 for any quantity of new equipment. Other railroads in the same district are expected to follow a similar policy.

Ford Seeking A. B. & A. Ry.?

Henry Ford is reported to be negotiating the purchase of the Atlanta, Birmingham & Atlantic Railroad, which operates between Atlanta, Ga., and Birmingham, Ala., touching the seaboard at Brunswick, Ga. A short extension of the road from Birmingham to Muscle Shoals would give access to the Alabama coal and iron fields.

nada's Sales Tax Called Unsound Law by Speaker

(Continued from page 8)

ause it cannot be established without ss discrimination. Take an article which exempt from the sales tax (and it must remembered that in this law, as in all r tax laws, there has been a lengthy list articles which are exempt from the c), it may be imported free of tax, but Canadian manufacturer of such article s to pay a sales tax on many of the maials he uses in its manufacture, which s foreign competitor does not have to y.

Take a job printer whose production of inted matter is $10,000 or more per year; pays a tax on the sale of his printed atter, but the job printer whose output less than $10,000 does not have to pay tax on his sales. It may be he is doing ll work, printing on paper supplied by e customer, and his output might easily present $30,000 for a job printer who ought his own paper. Take furs—furers buy their raw furs free of tax, because ey are on the exempted list. A small etail furrier has been classed as a retailer y the Department. He buys his raw maerial free of tax; he sells his finished product free of tax; but the bona fide manuacturer, with his factory, plant and equipnent, has to pay the Government 6 per ent on his sales. Take rice—we have hree rice mills in Canada. Unpolished ice comes in free of tax. After it has been hulled and polished, it is subject to a sales tax. These mills have to account for 6 per cent on their sales. Small Japanese concerns—and there are a number of them in British Columbia—import rice, uncleaned rice, free of tax and they hull it and polish it, and the Government has failed so far to collect any sales tax from those people. There is a question of confectionery. Sugar is exempt from the tax. The manufacturer of confectionery has to account to the Government for 6 per cent sales tax on his sales. The small shopkeeper who is manufacturing confectionery and selling it over the counter does not have to account for any sales tax, and their competition, aided by this sales tax advantage, is proving a serious condition for the manufacturers of confectionery in Canada.

Tariff Increase Better

We believe that all sales taxes should be abolished and that the customs tariff should be increased, particularly on finished goods. Such a policy would, in our opinion, mean that industry would revive; employment would be stimulated; immigration would be attracted; the railways would have greater earnings; the farmers would have a better market; and the country, generally speaking, would progress. Had Canada increased her customs tariff, we believe that sufficient revenue would have been derived without the necessity of a sales tax, and I think we need only turn to your own country for the proof of that statement. The United States made large increases in is customs tariff after the war, and in addition to raising the necessary revenue, the high tariff of your country has restricted imports from those countries where labor is cheap, and whose currency has depreciated; and it has made your country prosperous, which contrasts favorably, from your point of view, with the depression which has hung over Canada for the past three and a half years.

The men who are to administer the law frankly do not know how they are going to handle the question of refunds. Manufacturers are in a quandary as to the return of the tax to the Government; it is a very unsatisfactory situation. I think that any country which is considering other forms of taxation, should very, very carefully consider the effect of a sales tax before embarking on such a form of raising revenue. In the countries where it has been investigated, it has usually been decided that it is the last resort for raising revenue.

Indianapolis Employers' Officers

At the February meeting of the Board of Directors of the Associated Employers of Indianapolis the following officers of that organization were elected for the ensuing year:

President—Fred C. Gardner; Vice-Presidents—W. B. Harding and Samuel O. Dungan; Treasurer—J. Edward Stilz. A. J. Allen was reappointed Secretary and is now entering upon his twenty-first year of service with the Association.

FOREIGN TRADE

Spanish Government by Royal Decree Forbids Foreign Currency Purchase—Order Hits American Exporters

BY royal decree the Spanish Government has recently passed orders forbidding the purchase by exporters to that country of foreign exchange, ording to advices to the U. S. Departnt of Commerce from its Commercial tache at Madrid. The meaning of the anish order probably is that Spanish imrters are unable to purchase dollar exange in payment for American merchanse, owing to the uncertainty on the part the Spanish banks as to the application the decree.

Two cablegrams have been received at ashington from the U. S. Commercial ttache, the second being supplemental to e first and somewhat clarifying the sitation. As received by the Chicago Disict office of the Bureau of Foreign and omestic Commerce, these cables read:

> Madrid office cables royal order forbids purase foreign currency. Banks cannot negotiate me paper without sufficient proof. Bona fide erchandise held unpaid, with result banks canot cover transactions. Some banks will not pay tters of credit. Bankers think arrangement temorary and expect immediate relief.

The second cable read as follows:

> Madrid office cables royal order on exchange transactions amended by Commission being empowered to negotiate same provided sufficient reasons given. Situation not greatly improved. Royal decree March 12 rules foreign currency balances in foreign banks must be declared and liquidated within month. Impossibility dealing in future exchange considered unfavorable cotton imports.

If foreign currency balances in Spanish banks are liquidated, it will result in the transfer of foreign currency funds from Spain, and consequent use in international value of the Spanish peseta.

To prohibit dealings in future exchange will result in inability to finance imports of cotton and other commodities on a time basis, as the Spanish importer will be unable to buy a future to cover his requirements over the succeeding month.

Customs Ruling in Argentina

Lamport & Holt, Ltd., controlling a line of ships plying between New York and South America, has issued the following notice to shippers:

"By a recent regulation by Customs officials at Buenos Aires, no parcels or sample packages will in future be received in customs deposits at that port unless they are labeled 'Murstra' (sample) or 'Encomienda' (parcel). This regulation will be effective on and after March 15."

Protests Ocean Freight Rates

Interest has been aroused by the protest of Secretary of Agriculture Wallace against the increase of 25 per cent in ocean freight rates from North Atlantic ports to the United Kingdom. This advance amounted to one-tenth of a cent per pound on packing house products. Mr. Wallace objected on the ground that it would injure the farmers in meeting foreign competition. The steamship industry, in its reply, declared that, while the advance meant a great deal to it in offsetting losses in operation, it was not sufficient to make any difference whatever in the prices paid the farmers by the packers.

The rate increase went into effect on March 1, following similar advances from German ports to the United States on Jan. 1, a 15 per cent increase to South America on Jan. 1, and the decision of the Far East Lines to advance rates 25 per cent on July 1st.

Implement Exports Increase

Exports of agricultural implements from the United States in January again increased, amounting to $4,369,386, compared with $3,336,188 in December, and with $2.844,284 in January, 1923, according to the Department of Commerce. This is almost double the exports in January, 1923, and three times those for January, 1922. The value of implements exported during the seven months ended January, 1924 was $32,135,462, while in the same period of 1923 it amounted to $18,033,798. This total for the period ending in January, 1924, is greater than the total exports of implements in 1922, and is more than 60 per cent of the exports in 1923.

$1,500,000 in Mah Jong

Mah jong sets stood sixth in value in the list of declared exports from Shanghai to the United States last year, according to a report to the Department of State. They were exceeded in value only by exports of silks, laces, skins, eggs, and tea. The total value of the mah jong sets which Shanghai sent us in 1923 was $1,505,000, which was $176,247 more than the value of declared exports of hairnets, which have been for years an important import from China.

American Products Wanted Abroad

Send to MANUFACTURERS NEWS the numbers of those inquiries you are interested in and the information will be sent you promptly

AUSTRALIA—9503, cloth and trimmings for automobile tops and upholstery; 9466, machinery for manufacturing egg fillers for packing boxes.

AUSTRIA—9493, asbestos for building purposes; 9498, flour, best quality, 30 to 40 tons monthly; rice, 30 to 40 tons monthly; 9493, roofing felt; resurfacing materials; roofing slate.

BELGIUM—9476, coal—industrial, gas, and house use.

BRAZIL—9470, radio apparatus.

CANADA—9505, oil, cedar leaf.

CZECHOSLOVAKIA—9465, machinery for manufacturing men's belts.

DANZIG—9462, roofing paper without tar.

ENGLAND—9521, milk—evaporated, sweetened, and unsweetened—1,000 to 3,000 case lots.

ESTHONIA—9515, bicycles, light.

FRANCE—9468, agricultural implements; drugs, crude; insecticides; 9497, pork products; 9488, cotton press cloth for oil and aluminum industries, particularly cotton twill, unbleached and unsponged; 9468, fertilizers.

GERMANY—9499, beeswax; 9513, caustic soda; 9499, carnauba wax; 9498, cotton piece goods; 9481, gum, chewing; 9494, gold and silver in bars; 9489, knit goods, remnants; 9499, paraffin; rosin; 9519, shoes, large quantities; 9463, saws for woodworking mill; 9499, tallow.

HAITI—9473, match-making machinery, electrical.

INDIA—9469, buckles for men's and boy scouts' belts; 9446, cotton goods, remnants, and seconds; 9491, cotton piece goods, including white mulls, shirtings, nainsook, twills, printed sateens, poplin, and velvet; 9469, fittings for furniture, harness, and saddlery; locks and fittings for suitcases, trunks, and pocketbooks.

IRELAND—9500, roofing slates; 9501, roofing slates.

ITALY—9514, rosin for manufacture of paper and soap.

LITHUANIA—9483, sirup, corn, 30 to 40 tons.

MEXICO—9517, phonographs; phonograph records; phonograph supplies.

NETHERLANDS—9504, automobile accessories; fire-fighting apparatus; lighting material, electrical; novelties, all lines.

PANAMA REPUBLIC—9516, paper, writing, drawing, ruled sheets, and wrapping; 9456, school desks; 9516, school supplies; stationery.

POLAND—9512, rosin.

SOUTH AFRICA—9457, alarm clocks; watches, medium priced.

SPAIN—9478, scrap rubber.

SWITZERLAND—9507, automobile motors with magneto ignition, 4 and 6-cylinder, 30 to 35 horsepower; 9495, hemitine crystals; 9495, logwood or campeachy extracts.

SALES MANAGEMENT

*Present Period of Intensive Selling Has Abolished Old-Time "Order Taker" for Creative Salesmanship

II

By HOMER J. BUCKLEY
President, Buckley, Dement & Co.,
Advertising Specialists

SELLING is much closer to an exact science than most of us might think. The salesman who makes a study of the art of selling will find that he can "size up" his prospective buyer instantly and with an amazing degree of accuracy. Certain appeals with which he becomes familiar can be depended upon to invariably and uniformly breed certain emotions, which in turn cause certain definite actions. And a knowledge of these principles is absolutely essential to the process of bringing a customer to put his name on the dotted line.

My analysis of the salesmen in the insurance field is that they are divided into three classes—

THOSE COMING IN,
THOSE REMAINING,
THOSE GOING OUT.

Who is responsible for this condition?

I'll say to you frankly that if the merchandising concerns of the country operated on the same basis of personal selling as that on which the insurance agencies of the country do, most of them would have been broke a long time ago; and by the same token, if the insurance companies generally adopted the same efficient selling methods, training of salesmen, creating leads, follow-up systems and paving the way for the salesmen as merchandise concerns do, they would increase their business by leaps and bounds.

Insurance agencies—many of them—have succeeded to the degree they have in spite of poor salesmanship and lack of any intensive follow-up methods or any system of creating leads for salesmen.

Cold solicitation on unknown or uncertain prospects is the hardest game in the world to put any salesmen up against, and it is criminal that in this day and age so much of it is still going on.

Too many companies in the insurance business are lacking a well-defined plan of guidance for their general agents and sales forces in the matter of localizing sales, ferreting out potential prospects, and doing missionary work ahead of the salesman—to warm up prospects and place the company and salesmen in a favorable position for a hearing that will lead to sales.

Insurance salesmen waste altogether too much time chasing around looking for prospects. It's expensive and it's discouraging.

Homer J. Buckley
Underwood & Underwood

What insurance firms and general agents need is not more solesmen—but more high-grade planning of how to merchandise their business, to educate prospects to their needs and to win for their salesmen a careful hearing, by the employment of a follow-up system of sales literature to prospects. The company that canvasses the territory of each salesman systematically with business-building sales literature will double the selling efforts of their men and increase sales volume.

This is not theory—it's the record of hundreds of organizations, such as Burroughs, Ditto, National Cash Register, Addressograph, and others.

Too many insurance salesmen are one-time callers. If, on the initial call they meet with a sales resistance or are deliberately sidetracked with a discouraging interview, they fade away and oftentimes—more often than otherwise—they lose out on big business that just awaits cultivation.

The high cost of one-time calls should interest every insurance executive, and I am going to give you some figures which, while not taken from insurance experiences are, nevertheless, applicable to your selling efforts.

A thousand business men (merchants) kept accurate records for six months to see how many calls salesmen made before they stopped calling, and how often the salesman called before he secured the business. Here is the record on the calls:

48.2 salesmen made one call and quit;
24.4 salesmen made two calls and quit;
14.7 salesmen made three calls and quit;
12.7 salesmen made four calls or more.

The investigation revealed that 60 per cent of the merchandise the business men purchased was ordered on and after the fifth call.

I know this applies to insurance, because we had in our business an experience that coincides exactly with this point. About two years ago an insurance man called on me to talk group insurance. I was indifferent to his solicitation and terminated the interview very quickly. I did not know much about group insurance or its benefits, and not being up on it I was, therefore, down on it.

In the course of nine months, the same man called on me once every month. The first few times I resented it and told him so, but he was tactful and gracious and did not get peeved at my brusque handling of him, and finally he softened my attitude towards him.

In between calls he worked a little follow-up system on me, sent me data on corporations that had group insurance and how they felt about it—very effectively handled, pleasing letters. After nine months this man sold us a contract for our 300 employes and subsequently has written health, accident and old-line life insurance for a half dozen executives around our place, and all of us are boosters for him.

He was a creative salesman in every sense of the word. This is the type of salesmanship that we need in business today. The day of the order taker is gone and gone forever—I hope.

We are in a period of intensive selling—a time when it is necessary to have more than mere salesmen, if the business is going to grow—we must have creative salesmen.

Morris Hand Cranes

Electric cranes are often too powerful and too expensive for their service requirements, while most hand cranes are too cumbersome and difficult to operate, so Herbert Morris, Inc., of Buffalo, N. Y., manufactures a hand crane that fills the gap between these two extremes. These Morris cranes are easy of operation, swift of movement and built of the strongest and lightest materials possible, considering the work they are made to perform.

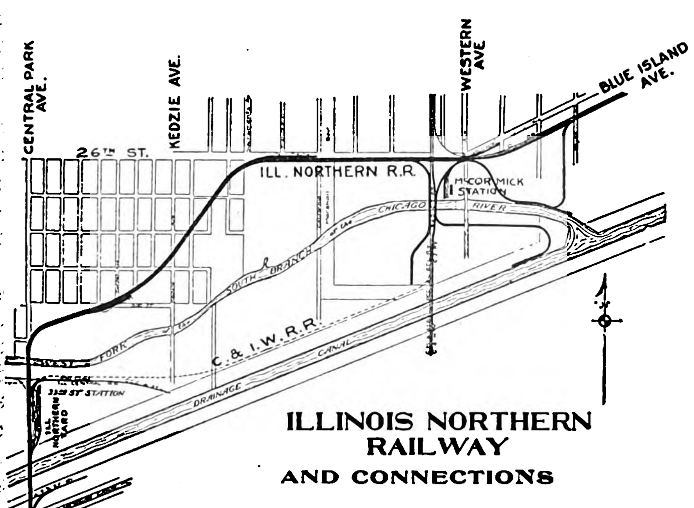
STERLING SERVICE



ILLINOIS NORTHERN RAILWAY
AND CONNECTIONS

Manufacturing Locations for Sale

Along the lines of the Illinois Northern Railroad, within the city limits of Chicago, are a number of first-class locations for factories. To factories locating along the line of this railroad the following advantages are offered:

This railroad has a local freight station from which transfers can be made to any of the lines operating in Chicago. Chicago rates apply to all freight in or outbound with unimportant exceptions. This road is purely a switching railroad run for the advantage and benefit of the business located along its line. The railroad has plenty of engines and men to take care of all business promptly. Few railroads in Chicago are in as good position as the Illinois Northern to give prompt, efficient service to shippers.

Land for manufacturing purposes along this line can be obtained at reasonable prices.

For complete information, including rates for transportation and prices of land, apply to

T. J. MALONEY, General Freight Agent
606 So. Michigan Avenue CHICAGO

Steady Prosperity Throughout the United States Seen for 1924, by Cadillac Head—Conditions in Southwest

STEADY, conservative prosperity for the country as a whole, absence of disturbing periods of either inflation or deflation and a substantial increase of motor car production during the year, were conclusions expressed by H. H. Rice, President and General Manager of the Cadillac Motor Car Company, upon his return from a recent trip through several of the Southwestern states.

"The purpose of my trip through the Southwest, and particularly through Missouri, Kansas and Oklahoma, was to determine business conditions there," Mr. Rice states. "The trip has convinced me that conditions will be far more prosperous than in 1923. We expect our business to be increased about 25 per cent over the 1923 total, although 1923 was our largest year.

"I was greatly impressed by the substantial developments going on in the states I visited; and there is evidence of return prosperity in the oil regions. Nowhere did I find evidences of over-extension of credit. Merchants have met the period of deflation by cutting inventories to a safe basis. They are not overstocked nor is there a shortage of goods which might create a seller's market. I look for a safe middle course on the part of business and industry in those sections this year; and that is the basis of the best form of prosperity.

"As to general business conditions in 1924, I believe that what applies to the Southwest is also true of the country as a whole. Nobody ever made money by selling the United States short. European conditions are not likely to hurt materially the prosperity of our own country. The European situation is improving, but we are developing our own prosperity aside from developments abroad, and as Judge Gary expresses it, with 110,000,000 contented, happy people, we are beginning to realize that we have within our own country all the elements necessary for economic well-being."

Use the Mails for Bigger Business

Seven Cents!

GOVERNMENT budget experts have recently made their estimate as to the cost of operation of an automobile on a mileage basis.

In preparing the annual budget the Government statisticians have figured original cost, depreciation, gasoline, tires, etc., and reports that the cost per mile for motor cars is 7 cents, and for motorcycles 3 cents.

Allowance is made for certain conditions, such as mountainous regions and poor roads, but while the figure may be high in some localities and low in others the experts state that the 7-cent figure is adequate and fair, and it has been accepted by the budget committee in figuring estimates.

Work for Auto Tax Revision

"A saving of $25,000,000 annually to the motorists of the country, which will result from concurrence by the United States Senate with action of the House of Representatives on the war excise tax on motor vehicles provision of the revenue bill has been the direct result of the work of lo- automobile clubs affiliated with the American Automobile Association," says H. M. Brown, General Manager of the Chicago Motor Club. "The Chicago Motor Club has had an active part in the fight for the relief which the House of Representatives has given and which we believe the Senate will also endorse. Fortunately our Congressmen have shown a ready willingness to come to the assistance of the motorists of the nation."

Misalignment Causes Tire Wear

One of the most prolific causes of tire trouble and premature wear on the casing is wheel misalignment. This means, of course, the wheels are not running true and it may be any one of the four.

The front wheels are cambered to provide ease in steering and are thus toed-in to care for the natural spread in driving. But if the pitch, or camber, is wrong the car will not meet the highway naturally and thus some part of the casing will have to bear an unnatural brunt.

Again, if the rim is not setting snugly the tire will wobble and it is sometimes difficult to tell this from misalignment.

Auto Production Increases

Production of 349,141 passenger cars and trucks in February was reported to the directors of the National Automobile Chamber of Commerce in New York. The output figures for February set a new high mark for this time of year, the total being 26 per cent in excess of production during the corresponding month last year.

Olds Breaks Sales Record

In the month of February the Olds Motor Works broke all previous sales records for a single month. February sales exceeded those of January, previous high month, by over 1,300 cars. The figures show an increase of 340 per cent over February, 1923, and 220 per cent over February, 1919, the next highest February.

General Motors Truck Sales

Sales of motor trucks during the first two months of 1924 by the General Motors Truck Company have exceeded all previous records for the same period, Vance H. Day, General Sales Manager, reports. The demand has been so great that the Company has more unfilled orders on hand than in any previous March.

akes-to-Gulf Waterway Is Urged On Congress by Illinois Manufacturers

HE Lakes-to-the-Gulf waterway—from Lake Michigan at Chicago to the Gulf of xico at New Orleans, via the Illinois l Mississipi Rivers—has been under con-eration by the Rivers and Harbors Com-tee of the House of Representatives of ngress during the past week. A number measures dealing with this important provement in the Middle West have been sented to the Committee, but the chief e apparently is that of Congressman lliam E. Hull of Peoria.

Manufacturers and Middle Western com-rce in general were represented at these arings by the Illinois Manufacturers' As-ciation. Charles A. Livingston, of the sociation's staff, appeared before the mmittee, with a statement of existing nditions which, in part, was as follows:

"The Illinois Manufacturers' Association lieves that the Hull Bill, or a measure nilar to it, can be agreed upon by the rious interests in Illinois, if the following sentials are drafted into the Bill:

"1. An adequate waterway that will carry barge ffic at all seasons.

"2. Provision for liquidation of past damage ims against the Sanitary District of Chicago iefly resulting from overflows and prompt ad-dication of any possible future damage claims, eferably by a fair-minded commission.

"3. Protection against future damage by means levees when necessary.

"4. Protection against pollution by raw sewage by means of dependable sewage purification works.

"The waterway from Chicago to the Mississippi River that will enable shipments to the Gulf of Mexico is needed to conserve the interest of Illinois manufacturers who have been placed at a disadvantage since the construction of the Panama Canal. The Panama Canal gives Eastern industry an extraordinary advantage over the Middle West as a result of cheap water transportation through the Canal to the Pacific Coast and Latin America. The Illinois waterway would be of tremendous advantage to the manufacturers and farmers of Illinois.

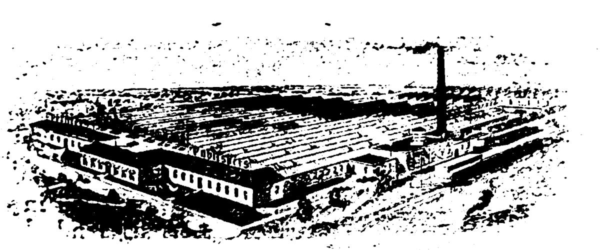
"The manufacturing industry of Illinois in 1919 produced $5,500,000,000 worth of manufactured products, a large portion of them coming from the Chicago district, and employed something like 800,000 persons. These industries all would benefit by the construction of a navigable waterway between Lake Michigan and the Mississippi River, even though they might not all ship by water. There is now a differential approximating from $1 to $1.50 per 100 pounds upon all our products when we attempt to distribute them upon the Pacific Coast as against the Atlantic ports. There is also a large differential between our transportation costs and those of the Atlantic ports in attempting to reach Southern distributive territories. Farmers, as well as manufacturers, would profit materially by the operation of this waterway."

Dairy Belt Farms Produce Over $1,500,000,000 in Year

The purchasing power of the dairy farmer is now from 5 to 10 per cent greater than before the war, while the purchasing power of the farm market generally is still below the 1913 level, according to Howard-Moorhouse, Inc., in a recent statement. Farmers in the Dairy Belt, the statement continues, will receive a gross sales income of close to $2,000,000,000 during the present crop year of 1923-24, to be divided among a farm population of 5,185,000 persons, and amounting to $380 per capita as compared to $415 in the Corn Belt and $185 in the Cotton Belt.

The sales income of the twelve states in the Dairy Belt—Minnesota, Wisconsin, Michigan, Pennsylvania, New Jersey, New York, Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut—will be about $150,000,000 over last year, an increase of 7 to 8 per cent. Total sales will amount to over $1,500,000,000 out of a total farm sales income of $9,500,000,000, or about one-sixth of the cash farm income of the country.

Per capita consumption of dairy products is expanding, but is still considerably below that of European countries.



What Are You Looking For From a Printer and Binder?

Equipment	The necessary modern efficient machinery and buildings to economically and speedily produce the printing and binding required.
Personnel	An organization of thoroughly trained men and women to operate the plant and deliver according to agreement, both as to time and quality.
Experience	Forty-six years of active continuous operation under the same name and management.

Our advice is to place your printing and binding with a firm that you know has these qualifications.

Your inquiries will be given our utmost care and attention.

BUSINESS AND FINANCE

*"The Field of Investment"—WhatIs Capital and Why Do People Save, Discussed Here by Investment Banker

By C. W. SILLS

Vice-President, Halsey, Stuart & Company, Chicago

THE topic assigned to me for discussion is a broad subject and difficult to treat in the brief space of time allotted to me. I shall, therefore, be able to merely touch upon some of the high spots to give a general idea of the subject. The outline given me to cover embraces seven main headings, as follows:

I. Definition of Capital.
II. Why People Save.
III. What are the Sources of Capital Supply?
IV. The Sources of Demand for Capital.
V. Forms of Credit.
VI. Commercial and Investment Credit Instruments.
VII. Functions of the Commercial and Investment Banker.

I. DEFINITION OF CAPITAL—Surplus wealth or savings is capital. Most people consider the capitalist one of great wealth. This is entirely erroneous. Every individual who saves in excess of consumption is a capitalist, provided his savings are not hoarded. Directly or indirectly he becomes a capitalist insofar as his savings are utilized, and all such wealth is utilized in the great scheme of present day business. Were it not for this, our governments, municipalities, industries, transportation units, public utilities, building operations, etc., could not function. We would revert to the day when communication, international and national, would stop and we would all be grubbers for mere existence, living from day to day by physical exertion for food. The four essentials of production are capital, land, labor and management. The capitalist receives interest and dividends, land owners rent, laborers wages and the business man profits on earnings of management.

"Why Do People Save?" "What Is Capital?"

IN accordance with the arrangement made with the Y. M. C. A. School of Commerce and the Investment Bankers' Association of America, MANUFACTURERS NEWS herewith presents the first installment of the second address delivered by some of Chicago's leading financiers and investment bankers before the Y. M. C. A. School of Commerce.

The general topic of this notable series is "Fundamentals of Investment." The first address was by Eugene M. Stevens, Vice-President of the Illinois Merchants Trust Company, and was concluded in the last issue of this magazine.

TWO KINDS OF CAPITAL—There are two kinds of capital in industry—working or short-term capital, and investment or long-term capital. The basis of this particular classification is the purpose for which such capital is used. I wish to point out the distinction clearly to you in order that you may thoroughly understand the significance of the various institutions which furnish capital on the one hand, or require it on the other, and the different types of credit instruments which evidence these transactions.

Working capital, as such, is used in financing the short-time day-to-day and month-to-month working requirements of industry; i. e., inventories, wages, supplies, taxes and general operating expense. Credits for working capital are furnished by the commercial banking institutions, usually for not longer than sixty or ninety days at a time, and have their origin in commercial transactions involving the purchase and sale of goods. The maturities of the various kinds of commercial credit vary as to the length of time involved in the manufacturing and distributing processes, these credits being in turn subsequently liquidated by the resale of the goods purchased, either as finished or partly finished products. Due to the vicissitudes of business generally, the credits extended by the commercial banker must of necessity be short-term, for he must at all times be in a position to meet the demands of depositors, whether demand or time. His loans, therefore, will usually consist of self-liquidating paper of the nature I have described, and are evidenced on the books of the bank by the item Loans and Discounts.

As distinguished from working capital, the purpose of investment or long-term capital is to provide the permanent facilities in industry necessary to do business. The credit so extended is used in the purchase of such assets as land, buildings, plants, machinery, equipment, improvements of all kinds, etc., each representing the facilities essential to the production, manufacture and transportation of goods. Because of the very nature of its use, investment capital cannot be liquidated by resale to jobber or consumer, but must and can only be paid off from the earnings therefrom. Such credits must necessarily be long-term and, therefore, their extension to borrowers is usually confined to individuals, and institutions such as insurance companies, savings banks, building loan associations, Federal and Joint Stock Land Banks and others better adapted to the making of long-term loans than the average commercial bank.

II. WHY PEOPLE SAVE—People save, not from a desire to accumulate money, but from the desire to command the commodities and services which money gives. This desire to save or, more accurately, the appreciation of the necessity for saving, has come down to us from our early ancestors who lived at a time when the scarcity of food and the bare necessities of life during

---

Are You "Behind the Times"?

Not many years ago your grandfather reaped his crops—picked his cotton — dug canals and loaded his ships by hand. He also shoveled coal on his fire and hauled out ashes.

Today — you have advanced. You have machinery to do the work your grandfather did by hand. But — do you still shovel coal and haul out ashes? In Chicago today — Manufacturers are keeping abreast of the tide of industrial advancement and *improving* their products, simply because they know that—

If it's done with heat—

ds of the year made saving during s of plenty a requisite to life itself in itter experience of drought and famine. ngs are the means of protection from itable age and death and loss of pro- ive energy. They provide the necessi- for dependents engaged in work other production, which is essential in the ntenance of family life. They furnish ation for coming generations, ending urther productivity.

his saving in modern times takes the n of savings deposits, investments of all es, insurance policies, etc., the growth volume of which becomes increasingly ater as new means and methods of pro- tion are found, thereby releasing for ther production and consumption the e, energy and capital thus saved.

(To be continued)

Bankers to Talk Agriculture

The joint conference of the Agricultural mmission of the American Bankers' As- iation with the Committee on Agricul- al Relations of the Illinois Bankers' sociation and the Agricultural College the State University of Illinois, which is originally set for Feb. 29 and post- ned, will be held on April 3 at the Col- ge of Agriculture, University of Illinois, rbana. The purpose of the conference is formulate a program of agricultural ork in the state to be carried out by the ssociation and to devise ways and means r doing so.

Corporate Financing Since the War Has Made History

(Continued from page 12)

year Tire & Rubber Company, which finally had to be reorganized and refinanced.

Compare it with what we might call an example of orderly financing. Take the Western Electric Company. It found a demand for capital; its business was increasing at an enormous rate; it was necessary for them to secure more capital. They did not wreck their financial structure and offer for sale a lot of preferred stock and notes, etc. They needed $25,000,000 and in 1920 it put out $25,000,000 of five-year 7 per cent general debenture notes. See how orderly they handled it. They didn't have a very long time to accumulate that amount of money so they put a conversion privilege in those notes providing that the investor, if he cared to do so, could convert those notes into 7 per cent preferred stock of the Company. That gave the investor a 7 per cent security, due in five years, and it also gave him an option on an equivalent amount of 7 per cent preferred stock of the Company. As conditions improved, the Western Electric improved, and as the earnings improved and 7 per cent looked particularly desirable as an investment;—as a consequence it was no trick to convert that $25,000,000 of borrowed capital into $25,000,000 of owned capital without any strain. And there are many other similar examples of sane financing.

These are the types of finance that, I think, have been largely overlooked. Of course, it is true some corporations were badly strained, pressed hard, had large losses and had to make the best bargain they could. The investment banker realizing that, put on rigid restrictions; but as time goes on we will learn that these conversion privileges are very valuable and it will often provide credit at a very low cost to your corporation.

Wilson & Co. Earns $7.61 On Common Stock in 1923

The annual report of Wilson & Company, meat packers, shows that 1923 was the best year since 1919 for the Company, so far as net income in concerned. The net income for 1923, before depreciation, amounted to $2,450,866, equivalent to $7.61 a share earned on common stock. The 1922 figures showed on 96 cents a share on the common. Despite this improved showing, the balance sheet as of Dec. 31, 1923, revealed a substantial decrease in working capital.

Current assets, as shown in the balance sheet, were about the same as in the previous year, but there was an increase of nearly $4,000,000 in notes payable, which in itself, explains the drop in net working capital from $19,599,155 at the end of 1922 to $15,622,086 as of December 31, last. Inventories were reduced by about $5,000,000 while receivables jumped $4,000,000. There was a gain of more than $1,000,000 in marketable securities.

A Helpful Banking Service

OUR direct connections with 7500 banks in the United States and 6000 in foreign countries make it easy for manufacturers and merchants everywhere to avail themselves of the many facilities of this vast organization.

A manufacturer shipping goods can assure himself of expeditious and efficient service by dealing through a Continental and Commercial correspondent.

New Tax Bill Like Window Tax in France, Says Revell

The House of Representatives of the Federal Congress has passed a new tax bill; not just what the Administration wanted or the people expected, but it has finally passed one and sent it to the Senate.

Throughout the controversy that has raged over the "Mellon Plan," the "Garner Plan," and various other "plans," Alexander H. Revell of Chicago has contributed a number of interesting letters on this subject to members of both branches of the Federal legislature. Now that the Senate has before it the House Bill, Mr. Revell sent, a few days ago, the following unique message to each Senator:

> "Many years ago, one basis for appraising buildings for taxation was to count the number of windows. The result was that each new structure was built with as few windows as possible. Fresh air, sunshine, and health gave way to darkness, poor ventilation, and disease.
>
> "The almost total absence of windows noted by travelers, in many of the older houses in France, is due to the window tax. In some structures, close observers will see comparatively modern patch-work windows, the result of later intelligence.
>
> "Were such a taxing system in vogue today for improved realty, it would be termed the wildest kind of economic and hygienic folly. Yet in other channels of revenue, our modern tax regulators have apparently made little or no progress beyond this primitive system. They have an eye to the moment only. Instead of seeking to promote the largest wholesome expansion of industry, with an attendant increase in revenue, they ask: 'What is the most we can get? Never mind the aftermath.'
>
> "Industry, as well as individuals, need decent living conditions, else the disease of deficits and unemployment ensues.
>
> "Can Congress see the parallel?"

Fairbanks, Morse & Co. to Issue Big Stock Dividend

Stockholders in Fairbanks, Morse & Co. are to participate in stock distribution of more than $7,000,000 from its $17,400,000 surplus, according to an announcement by the Company. The Company started in 1893 with an investment of $300,000 which has now grown to $24,800,000. It is the plan to increase the common stock from 325,000 to 375,000 shares, no par, and to issue $12,500,000 of new 7 per cent cumulative preferred stock. With this it is intended to declare a stock dividend of $25 a share, payable in the new preferred stock, on the 293,977 shares of common stock now outstanding. The stock dividend, therefore, would amount to $7,349,425. It also is intended to retire the present $1,700,000 preferred stock. The recapitalization will leave about $5,150,000 of preferred and 81,000 shares of common.

Studies Textile Industry Abroad

J. H. Chaplin, Vice-President and Director of Sales of The Root Company, Bristol, Conn., manufacturers of automatic counters, has recently gone to England to superintend the installation of some of these machines in a number of textile mills. While in England Mr. Chaplin will study textile methods of that country.

Speakers at March Meet of the Costs Association

At the March evening dinner of the Illinois Manufacturers' Costs Association, to be held at the Hotel LaSalle on March 27, two well-known speakers on costs will be heard. The first will be G. M. Pelton, Comptroller's office of Swift & Co., Chicago, formerly Assistant Professor of Accounting at Northwestern University School of Commerce and with Arthur Andersen & Co. certified public accountants. His subject will be "Delegation of Functional Responsibilities in Industry."

The second speaker will be John C. Naylor, Comptroller of the Pet Milk Company, St. Louis, a lecturer on accounting at St. Louis University and a member of the Executive Committee of the Southern Illinois Manufacturers' Costs Association. His subject will be "Normal vs. Actual Overhead Costs."

Southern Costs Assn. Meets

An especially good program was arranged for the March dinner of the Southern Illinois Manufacturers' Costs Association, held at the Missouri Athletic Club in St. Louis on March 21. Francis A. Thornton, Professor of Economics and Secretary of the University of St. Louis, spoke on the "General Economic Situation of To-day." Federal income taxation was discussed by F. C. Belser, members of Price, Waterhouse & Co., of St. Louis, his subject being "Federal Income Taxation."

HEAT LIGHT —UTILITIES— POWER COMMUNICATION

E first World Power Conference ever eld is scheduled in London in July, . Government representatives and bers of engineering societies of the ng nations of the world will meet to ss and develop means for the use of ower resources of the world, and, ac- ing to present plans, the conference be divided into four main parts:

The national power resources, including electric, oil and minerals.
Power production.
Power distribution.
Power utilization in industry, in the home, the use of power in electro-chemistry, for ination, etc.

here are also being planned meetings conferences of groups of specialists; civil, electrical and mechanical engi- s; of power consumers and manufac- rs of the instruments of power pro- tion; of experts on the financial and nomic aspects of power production and

t is further planned to discuss the pos- lity of establishing a Permanent World wer Bureau to collect data, develop in- tories of world power resoucres, and the international exchange of informa- n on the entire subject.

). C. Merrill, Secretary of the Federal wer Commission, has recently returned New York from the British capital where, Chairman of the American organizations be represented, he attended meetings of various official boards which are per- ting plans for the meeting.

Insull to Buy C. & I. W. Ry.

Plans are being made by the Common- alth Edison Company and the Peoples s Light & Coke Company, two Chicago rporations under the management of muel Insull, for the purchase of the icago and Illinois Western Railroad, erating about twelve miles of track on e outskirts of the city. Application for rmission to make the purchase has been ed with the Illinois Commerce Commis- on.

The companies will pay $204,500 for tstanding capital stock, $516,000 for de- and notes having a face value of $650,- 0 and will assume $959,000 general ortgage 6 per cent gold bonds maturing 1947, heretofore guaranteed by the olese & Shephard Company.

The railroad is vitally important be- ause it affords connection between the rgest plants of the two Chicago utility ompanies and all the carriers that tap e coal fields upon which the city is de- endent for its gas and electricity supply.

The railroad has a direct or indirect onnection with all railroads in Chicago nd would provide a direct means of trans- orting coal from the main line roads to the Crawford Avenue generating station of the Commonwealth Edison Company, ultimately to be the largest plant of its kind in the world, and to other plants of the companies.

The Crawford Avenue plant will occupy a tract of land containing approximately seventy-two acres and when completed will represent an investment of about $70,000,000. The estimated coal consumption of the plant during next year will be about 700,000 tons and when it is completed will have an estimated consumption of 3,000,000 tons annually.

North Shore-Milwaukee Report

Another corporation to record the most successful year in its history is the Chicago North Shore & Milwaukee Railroad, which operates the electric line between Chicago and Milwaukee. A notable feature of the report is an unusually successful compaign for employe and customer ownership. More than $1,000,000 of stock has been sold to employes and customers.

About 70 per cent of the employes bought stock, the majority paying for it on a monthly payment plan. The number of stockholders has increased from 840 to 1,936, while the number of subscribers buying stock on monthly payments brings the total to more than 3,000.

Operating revenues last year totaled $5,945,271, or 18.71 per cent more than 1922, while net income of $686,864 marked a gain of 32.61 per cent. Additional equipment, costing $649,000, was acquired. Dividends totaling $159,267 were paid on the prior lien and preferred stocks, after which a surplus of $350,237 was established.

Edison's Net Income, $6,276,374

Net income for 1923 of the Commonwealth Edison Company, according to its annual financial statement, was $7,552,117, equivalent to 11.21 per cent on the average capital stock of $67,362,525 outstanding during the year, or to 10.49 per cent on the $72,000,000 stock outstanding at the close of the year. Net income for 1922 was $6,276,374, equivalent to 10.91 per cent on the average capital stock of $57,530,200 outstanding during that year, or to 10.46 per cent on the $60,000,000 outstanding at the end of the year. After paying dividends, 1923 produced a surplus of $2,163,115, which brings total surplus up to $12,703,312.

Chicago's 'Phone Calls

The average number of telephone calls in Chicago during 1923 was 3,250,000 daily. That is an average of more than one call for every day for every man, woman and child in this city.

"I'll Call You"

Softens the Pang of Parting

TO the traveler, evening brings lonesome hours. Sometimes you long to pack your grip, jump the first train and get back home at once, regardless of the unfinished business of the trip.

When you feel this way, go to the telephone and call home by "long distance." The Bell wires will carry your voice, which is yourself, back to your loved ones, relieve their anxiety as to your safety, and give you new zest for the morrow's tasks.

QUALITY, PREPARATION AND SERVICE

TO claim for a product that it is the standard of its kind, is an assumption that should not be made unless it can be maintained. We will not knowingly make exaggerated claims for our coal, and we believe that we do not overstep the bounds of truth when we say that our *Genuine Harrisburg White Ash Coal* is accepted in general as the standard by which Southern Illinois coals are measured.

Thousands of years after old Mother Nature deposited this particular seam of coal, nearly four hundred feet beneath the earth's surface, the hand of Providence seems to have guided us in locating it and making it available for use. We have spent thousands of dollars in equipment in order that, after bringing this coal from the bowels of the earth, it could be properly sized and prepared for marketing, either for domestic or steam use. We, of course, must acknowledge that credit is due **MOTHER NATURE** for the quality, but, on the other hand, we must not be deprived of our share of the credit for supplying the means and method of preparation. Quality and preparation are absolutely essential—we have both.

Your Time Is Money

Your freight shipments have often been delayed more between your doors and the freight stations than on the railroad.

Quick and careful freight house trucking is our specialty.

Perhaps the operation of your own trucks runs your trucking costs too high.

We can do your trucking cheaper and quicker than you can — that is our business.

Perhaps your trucking demands come only at certain intervals.

Tell us your requirements and let us submit our estimate for your trucking.

Perhaps your neighborhood can support a regular trucking service.

Let us study your needs and submit a schedule to care for your neighborhood trucking.

Perhaps you require fast and safe suburban and interurban service.

Our despatcher can give you a schedule as exact as a railroad time card.

We have 75 trucks from 1 to 7 tons capacity in perfect running order day and night.

Let us help you save your money.

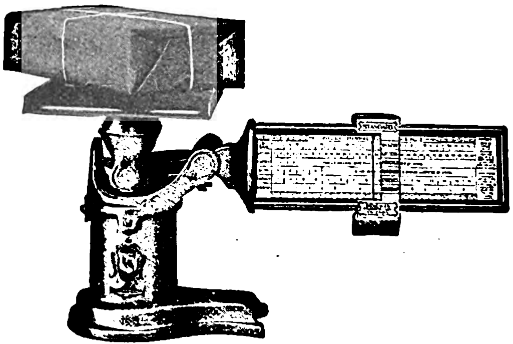
"Standard" Postal Scale
With Adjustable Beam and Interchangeable Dial



Made in Two Sizes
No. 2 "Standard" Capacity 2 pounds
No. 4 "Standard" Capacity 4 pounds

A fine wire on the sliding poise indicates the cost in cents on all different classes of mail matter.

The beam can be instantly turned by the hand to any angle, so that the dial can be read from any position.

In case the postal rates should change at any time, a new enameled dial can be mailed and inserted by anyone. This insures a perpetual scale. Warranted accurate.

An Epoch in Our History

1914–1924

IT IS with a profound sense of appreciation that we announce the tenth anniversary of our organization. We pride ourselves not so much upon what material progress has been made, as upon the cherished relationships that have been established during this eventful period.

In sincere gratitude to our many friends who have made this milestone a possibility, we now dedicate ourselves to that ideal of industrial perfection which will make us worthy of their continued approval and support.

Patience, Patience, Patience

THE future of the Illinois waterway, or so much of it as depends on legislation by Congress, is not reassuring.

Eastern interests, principally New York and Canada, are opposed to diversion of water from the lakes through the Sanitary District. They exert a strong influence on the House Committee on Rivers and Harbors, which has under consideration the Hull Bill, which would make the Illinois waterway possible.

Most of the opposition is based on possible injury to power interests, but Wisconsin, Indiana, Ohio, Michigan, Minnesota, and Iowa interests are apprehensive over impaired navigation that may result from lowering the lake still further. They claim they have already lost six valuable water inches.

Secretary of War Weeks has asked that legislation providing for a flow of 10,000 cubic feet a second through the Sanitary District (needed for sanitation as well as for volume through the Canal and the Illinois River) be held up until November when a decision on the legality of such flow will be reached by the United States Supreme Court.

Chevalier Joliet and Pere Marquette, who were the first white men to visit Illinois in 1673, going down the Des Plaines and the Illinois to the Mississippi River, both recommended (to France) an Illinois waterway that could carry barges and ships as well as birch bark canoes.

Apparently all we need is patience—and more patience—and still more patience.

Wrecking the Railroads

IN 1923 a total of 1,897 bills concerning the regulation of railroads were introduced in the legislatures of forty-three states, and of these 377 became law, according to the National Industrial Conference Board. An idea of the character of the bills presented may be gained from the following examples, none of which was enacted into law:

> **One bill required that all shipments must be moved sixty miles per day, although for the country as a whole the greatest average daily movement per car was 30.7 miles, made in October, 1923. Another bill provided for the rectification within a year of all curves of more than two degrees. In one state a bill was introduced prohibiting the use of the telephone in the dispatching of trains.**
>
> **In another state, a bill restricting the speed of passenger trains was presented, which would have had the effect of adding five hours to the schedules of the trains on the line of one of the railroads which crossed the entire state.**
>
> **In the Illinois General Assembly attempts were made to**
>
> **(a) reduce the number of cars on freight trains, practically splitting in half the size of the present trains.**
>
> **(b) unnecessarily increase the number of train men in order to afford more employment to Brotherhood members.**
>
> **(c) make it unlawful for railroad companies to carry more passengers than seating capacity.**

Of the 377 bills which became law, probably a majority were of minor importance but nearly every one added to the cost of railroad operation. No wonder the railroads—as a whole—did not earn more than 4.18 per cent on capitalization in 1923. No wonder shippers cannot get lower freight rates.

Taking the Risk Out of Foreign Trade

FOREIGN trade in the Middle West is looking up. A significant meeting representing the Mississippi Valley was held last week at the Union League Club in Chicago. It was under the auspices of the American Manufacturers Foreign Credit Insurance Exchange, Inc., and 180 foreign trade fans were present. It was a rallying of the Central West membership of the Exchange, which is national in scope.

"Making Foreign Trade Safer" was the keynote of the meeting. That is what the A. M. F. C. I. E. is doing. It issues credits; it takes the risk out of foreign trade; it makes sure exporters will get their money; it lists the "dead beats" and the undependable among prospective overseas customers; it investigates the financial stability of all foreign buyers, many of whom need such investigation.

This organization is doing more, perhaps, for foreign trade than any other body. It is conducted by business men on business principles, and its officers and directors and credit experts know the foreign trade field like a well-thumbed book.

No One Escapes Taxes

MANUFACTURERS and business men owe it to their employes to explain to them either through letters or talks or possibly notices on bulletin boards, that they do not escape taxes. Henry Ford recently had an article in *Collier's Weekly* in which he said:

> It is high time that we got to thinking straight on taxes. There should be nothing political about taxes. The bread we eat is not partisan, and neither should the taxes we pay be partisan. People seem to be fooling themselves about taxes. We have had a period of hysteria in government. No one seems to care how much government costs, provided the money is raised from the other fellow.
>
> It is time we put a stop to this and started to think of taxes in terms of the cost of living. Every cent the Government spends, just as every cent we, as citizens, spend, has to come from somewhere. Any administration or any set of legislators that advocates high taxes ought to be run out of office, because what they are really advocating is the high cost of living.
>
> There is nothing more dangerous to the prosperity of the country than putting heavy taxes on those who seem to have more money than they need.

Mr. Ford says that he personally does not care how much he is taxed and we believe him. He adds, however, that the more taxes he has to pay the less he can do for the workmen in his employ—and we believe that also.

Other People's Money

TAXPAYERS—including the millions who are indirectly taxed for rent, food and other living expenses—should keep an eye on Congress. Special measures now under consideration call for an expenditure of $600,000,000 in addition to budget expenses.

Meanwhile, there are so many investigations in Congress that the Tax Reduction Bill may not be passed.

Write to your congressional representatives. Tell them to go light on spending the people's money and get down to business on a tax reduction bill. Otherwise living costs will be higher than ever before.

The Senate Finance Committee has shown its good judgment by recommending the Mellon Tax Bill, which is a scientifically prepared measure. It will reduce taxes and furnish the needed revenue. But it has a long, hard journey before it can get the approval of both houses.

Hope for Wisconsin

MANUFACTURERS of Wisconsin will be glad to learn that David S. Rose is a candidate for Mayor of Milwaukee on an anti-Socialist, anti-tax boosting, anti-industry-baiting ticket. The Socialists have driven a good many manufacturers out of Wisconsin. Perhaps the movement to put Mr. Rose in as a safe and sane mayor may furnish an example to the rest of the state.

Varns America Against Bolshevists

Soviet's Insidious Efforts to Wreck U. S. Government Told by Russian Count, Former Imperial Army Officer

By COUNT CHEREP-SPIRIDOVICH

Late Major-General of the Russian Imperial Army

Count Arthur Cherep-Spiridovich

REVOLUTION, which has worked such havoc in Russia, simmers in Chicago. Some day it will reach the boiling point; then look out for an plosion. I do not want to be considered alarmist, but manufacturers, business en and, above all, the working men of is country, should give careful thought what has happened in Russia and the ossibility that it may be repeated in the nited States.

"A revolution can never happen in this ountry," is the confident assertion of men our intelligenzia. Alas, that is what hey thought in Russia! No one ever be-eved that educated men and women would e hunted down like rabbits, shot and tor-ured. No one ever believed that property ights utterly would be destroyed; that the an with a factory, a home or a small in-ome would have his property wrested rom him by the commissars of the Red epublic and plunged into lower depths of isery than the imagination even of a Dos-oyevsky could conceive. They said there ould be no revolution in Russia. They aid there could be no World War, though have foretold them, but we must believe what we have seen and what we have ex-erienced.

I have been through hell in Russia and do not want to see the United States lunged into the same reign of terrorism. No one but a Russian who speaks the language and is in contact with the Russian-speaking elements in Chicago, can realize the danger. There are at least 300,000 persons in Chicago who came from Russia and speak Russian. All but a slender 3,000 of these are bolsheviki. They are bolsheviki by instinct and education. They are in constant touch with the Russian Soviet. They are well supplied with funds. They are exercising an insidious propaganda in their homes, in factories where they are employed, in politics, and even in the public schools. I am informed on creditable authority that some of these Russian children have demanded that they be permitted to debate in school the question of recognizing the Soviet Government.

Of these thousands of Chicago bolsheviki, I do not know how many would plunder, burn and slay, but they are revolutionists at heart and ready to overturn American institutions, with the same recklessness and enthusiasm that marked the plundering by the Russian "jail birds" of the landed estates in Russia and the looting of factories and stores in Petrograd, Moscow, and other Russian cities. They are admirers of Trotsky. Trotsky to them is a god, but one of their own race. Not only one of their own race, but one of their own trade, for a great many of the Chicago Russians are in the clothing manufacturing plants, from one of which Trotsky was graduated before he engaged in journalistic work in New York and went to Russia to be crowned as one of the Red kings.

The only Russian newspaper in Chicago, *Russki Vestnik,* is a bolshevist anti-Christian organ, although its owners themselves are not Red, and belong to the church. But their writings are of the character that is most pleasing to their readers, who are bolsheviki.

How Can Reds Be Fought?

What can be done to counteract this revolutionary propaganda in Chicago? The small group of Russians, 3,000 in number, who are anti-bolsheviki, are doing what they can, but they are poor. They are men and women who have fled from Russia, some with only the clothes on their backs and a few jewels.

I am conducting a little book store at 752 North Robey Street, Chicago, for the purpose of giving Russians decent books and wholehearted advice and help. We are doing the best we can to counteract the bolsheviki movement in this country. But unless this small group is helped to organize a center and given the means to enlighten their compatriots, they will be submerged by the Red wave, tempted or terrorized to join the Reds or compelled to leave Chicago.

Counteracting the threatened revolutionary movement in this country and the second World War against the U. S., is all that I have to live for. Nothing else is left. My family is gone, my property has been confiscated or destroyed, my friends have been shot or have become victims of starvation and that is why I feel so strongly upon this subject.

When I read in a morning newspaper on June 8, 1918 that my two surviving sons, officers, had been shot to death by the bolsheviki in Moscow, a mile distant from my home, after they had been tortured for forty-eight hours by Chinese executioners, I concluded I had nothing more to do in Russia. My wife and my only brother had died heartbroken when my two other sons and two only nephews were killed in the World War.

An officer attached to the staff of Colonel Raymond Robins, of Chicago, who was then in Moscow, warned me that my death was already decided upon by the Reds and that every second counted if I were to be saved. The bolsheviki feared an outburst of the Moscow people's anger, if I were murdered, but watched me closely and resolved to kill me at the first opportunity. I was indifferent, had reached the state of mind best described by the fatalistic Russian

Russian Major-General Opposes War

COUNT Arthur Cherep-Spiridovich, a Major-General of the Imperial Russian Army under the late Czar Nicholas, is the author of seven books on international political history, written before 1914, in which he foretold the war and most of the events which have occurred since that time. He is a descendant from the ancient Grand Dukes of Russia and Lithuania. When 19 years old he was brilliantly graduated from the Imperial Navy School at Petrograd and transferred to the Admiralty, reaching the rank of Major-General at an early age. For twelve years he served as President of the powerful Slav Society of Moscow, the efforts of which had aided in the liberation of Rumania, Serbia and Bulgaria. He was President of the Balkan Committee in Paris in 1912-13, and of the Central Committee of "Pro-Bohemia, Croatia, Hungaria, and Polonia" in 1913-14. He is master of nine languages.

Though born in September, 1868, the General is still strong, enthusiastic, cordial and indefatigable. He never smokes, never drinks spirits and seldom eats meat, because it means the killing of an animal.

"Nichevo" (nothing matters),* but in one sleepless night the idea came like a flash that Providence took from me my entire family in order to make me go away and work to stop the silly World War and prevent other wars.

Escapes From Russia

When the German Ambassador was killed, Moscow was in a panic. I profited by it and jumped on a train going to Archangel. Providence again saved me, and I slipped into a steamboat going to Murmansk. Arrested by the bolsheviki and condemned to death upon arrival at Kem, I was saved by the British Marines who captured the steamboat with the bolsheviki and me on it. Only three hours before our approach to Kem, the British General Maynard, took the city. Had it occurred only four hours later, I would have been shot. On General Maynard's train I came to Murmansk on the Arctic Ocean, and joined General Fred Poole who declared that I ought to remain with him as his right hand. Not until a month later could I persuade him to let me go to London to pursue my efforts to bring about World peace.

On Sept. 13, 1918, I was in London facing General McDonogh, Chief of the War Intelligence Department. I reminded him that in 1912, twenty-four months before the war started, I had sent to the then British Secretary of War, Winston Churchill, a detailed report warning him that war was imminent, that Germany, Austria and Turkey would assault Russia, that Italy would be attracted, and other things now realized. I received a personal letter of thanks from Winston Churchill.

My advice to immediately sign a peace with Bulgaria was accepted by England, and this was done two weeks later; as I foretold, this caused the disruption of Austria from within and, four weeks later, the panic in Germany and her surrender. Thus, it seems, my interference saved some 2,000,000 or 3,000,000 of American lives.

After several months in London, I became convinced that the chief efforts of the Russian bolsheviki in staging a world wide revolution would be directed in the United States, where so many of their sympathizers were located, and so I came to the United States.

The greatest danger in this country is found in the indifference of the intelligent English-speaking people. "There are none so blind as those who cannot see; none so deaf as those who cannot understand."

Chicago the "Red" Center

"Scrutator," a writer in the *Chicago Tribune*, recently pointed out the danger when he said that Chicago was selected to be the Red center of America. Why? Because there are but 700,000 Americans and 2,100,000 foreigners—all being carefully *bolshevized* while *nothing* is being done to explain to the masses that a revolt is staged to make easier a foreign circular attack. Americans are blindly optimistic, chiefly because they have no school of foreign politics and no reliable history. Conferences held at Williams College, Williamstown, Mass., were amazingly childish. Millions of dollars are being granted to universities, but a paltry $700 cannot be found to publish a *truthful* history of the last 150 years, which I wrote, and which is indispensable if this country wishes to create statesmen (now lacking) and avert a revolution.

For a modest sum of $3,000 yearly a "Sunday School of World Affairs" could be conducted, but those who throw away millions to the universities (which are "one big football team," a scientist has said) do not understand the need of having at least one "School for Foreign Affairs," in which could be explained the "Science of Political Foresight" elaborated by me after fifty years of study.

Some thinking persons warn us of the approaching catastrophe in our civilization. "Will civilization survive?" asked even John D. Rockefeller in Chicago. Yes! I am sure it will, if the "Science of Political Foresight" is spread and an address worthy of history is published, and if an anti-Red counter propaganda can be started at once in Chicago. The Teapot Dome scandal is being artificially staged, as any moving picture is staged, only to impair the prestige of the Government in the eyes of the masses, and, as Mr. Daugherty took certain measures against the Reds, he receives his punishment.

Every day we read warnings of a new war. On March 1, 1924, it was said by Shaw Desmond, and on March 7 by O. Garrison Villard, and others, that another war is inevitable. Bertram Russell, in his book *"The Prospects of Industrial Civilization,"* foretells a nearly universal war against the United States. This is partly justified by the appeal of Ramsay MacDonald to Poincare "to face the United States *together*," and the warning of G. Bernard Shaw that "the payment of the British debt *must* be lightened." Japan and China both are furious against the United States.

"An Ounce of Prevention"

All this is conducive to certain catastrophe, but the situation could be remedied in my judgment by proper enlightenment, education being too slow a method. In Russia, the Bolsheviki party counts only 500,000. In the United States there are at least 5,000,000 persons who aspire to a "change." When once it is started, it always brings revolt, and revolt speedily grows into revolution. "An ounce of prevention is worth a pound of cure."

The Massachusetts Public Interests League of Boston has issued a leaflet on the penetration of women's colleges by the propaganda described as "radical," which covers all varieties of subversive movements from "Parlour Socialism" to straight bolshevism, all of which movements are assisted by the world-revolution center at Moscow. Here is a phrase from that leaflet:

"The radical propaganda now being carried on in many women's colleges is of so demoralizing a character that it is highly important that parents and the pub should know it."

I entirely agree with *The Dearborn I dependent,* which says that nearly all t women's clubs in America are "bolsh vized." These clubs count 11,000,0 women.

Mississippi-Warrior Barge Line Give Express Service

The Mississippi-Warrior Service, operating a Federal barge line between St. Louis and New Orleans, announces two new express services between those points. The first, effective today (March 29), is from New Orleans to St. Louis for the benefit of the coffee trade, giving a 10-day service at a saving of 10 per cent in freight. Steamers will leave New Orleans every Saturday.

Effective April 4, an express service Southward from St. Louis will be inaugurated, with landings at Cairo, Memphis and Vicksburg, giving a 5-day express service. Steamers will leave St. Louis every Friday evening, arriving at Cairo on Saturday, Memphis on Sunday, Vicksburg on Tuesday and New Orleans on Wednesday night.

This is a new fast merchandise service and is in addition to the present regular through steamers. The new service will accommodate about 8,000 tons of high class merchandise per month, while the regular service will take care of another 40,000 tons of general cargo downstream. The new express service gives shippers the benefit of practically all-rail speed at approximately 20 per cent saving in freight charges.

H. E. Ruddiman is General Agent of the Mississippi-Warrior Service, with offices in Chicago.

State Police Friends Are Urged to Help Candidates

Friends of the proposed state police in Illinois are urged by the State Police Auxiliary Committee, Chicago, to get voters out to the state primaries on April 8 in the interest of the following candidates for election to the legislature who are favorable to passage of a state police law:

10th District: Ogle and Winnebago counties—Senator H. S. Hicks, Rockford; strong for state police; his opponent is Representative Charles W. Baker, Monroe Center, opposed to a state police.

16th District: Marshall, Putnam, Livingston and Woodford counties—Senator Simon E. Lantz, for re-election; strong for state police; different elements working against him.

18th District: Peoria County—Former Representative Charles W. La Porte, Peoria; strong for state police; four candidates in race.

24th District: Champaign, Piatt and Moultrie counties—Senator Henry M. Dunlap, Savoy; for re-election at request of 325 prominent citizens, also friends throughout the state; "father" of the State Police Bill; Radicals gone to extremes, classing him with "Rogues Gallery" subjects.

"Every good citizen having friends or business relations with citizens in those districts should help get out the vote. Flood them with letters," says the Committee's circular.

(*Bismarck always wore a ring with "Nichevo" engraved on it.—Editor)

What Lies Ahead of Us In Business*

Forecast of Conditions Shows Big Improvement This Spring, With No Continued Decline Before Next Fall

By RAY VANCE
President, Brookmire Economic Service, Incorporated

I

THE subject of my talk naturally divides itself into three sections: First, what lies immediately ahead of us? Second, what lies ahead of us during closing months of 1924? and Third—at lies ahead of us for the next five or years?

The present business situation is one out which business economists disagree dely. In such a condition it is absolutely possible that I should give you an analy- and conclusions regarding future busiss without touching upon matters which realize are in dispute today. Briefly, ere are three views held regarding the tcome.

The most pessimistic view is that we are ll in a great depression which began rly in 1920, and which will not end till has been as great as was the war prosrity. Those holding this opinion are mpelled to believe that we have as yet ffered little more than half of that deression, and that the improvement of nditions in 1922 was simply a false ripe for which we must suffer in a prolongaon of the depression, which is likely to e business worse than it was in 1921.

The second, and somewhat more hopeful ew, is that last Spring we reached the est of prosperity from which we must go rough a major depression before we can ope for prosperity again. This does not ecessarily expect conditions to become so ad as those of 1921, but does carry the nplication that they will continue to get orse throughout at least a large part of 924.

The third and most hopeful view is that ast Spring marked the close of a period f business improvement which will be followed by a period of prosperity before we nter another general business depression. uch an opinion must treat the business eaction of the past Summer as a temporary etback, and must expect a continuation f better conditions at least through the ummer of 1924.

These variations in conclusions are not wholly accidental, but are the result of diference in methods by which the situation s judged. Let me, therefore, state in the riefest possible way some of the fundamental beliefs and disbeliefs with which I pproach the matter of business forecasting:

1—As a student of economic history, I cannot elieve that business prosperity is in itself a sin or which we must atone by a directly equal depression.

Ray Vance

2—I do not believe that business, automatically and regularly, passes through periods of improvement, prosperity, liquidation, and depression in cycles which cannot be varied by voluntary human effort.

3—I do believe that at irregular intervals we, in our business activities, produce unhealthy conditions in business.

No business situation is completely free from these unhealthy spots, any more than the human body is ever in a state of perfect health. But there is a breaking point for business just as surely as there is a breaking point for human health. Depressions are apparently just as certain to come as human sickness. But here the parallel ends. The human patient frequently dies. Business always gets well. From history I believe that every business prosperity will eventually end in a depression and, conversely, that every depression has a prosperity period coming beyond it.

Misuse of "Business Cycle"

You can call this succession of prosperity and depression a business cycle if you want to, I call it that myself. But the words "business cycle" have been shamefully misused—sometimes by business forecasters themselves—and even more frequently by hasty critics of the activity. It is true we have periods of prosperity and periods of depression. From that very fact we must have improvement while we are on the way from depression to prosperity, and we must have liquidation while falling from prosperity to depression.

The business cycle, then, is an order of events occurring in a fixed sequence which gives us an assurance of the tye which the next movement in business must follow. But this leaves us the all-important question, when will a change for the better or for the worse take place?

Answering this question brings us to the recognition, measurement and appraisal of those symptoms which tell us months in advance either that business is getting so unhealthy that a period of depression is coming, or that conditions are again healthy enough to warrant the hope of coming prosperity. And in this study let us remember that no situation ever exists without some bad symptoms. Nor does any exist without some symptoms that seem to point to prosperity. Further, let us remember that prosperity and depression are in themselves only relative terms. In other words, are things to get immediately better or immediately worse?

As a very first test, if we are going into immediate depression we should expect to find a situation in which speculation of various kinds has been occupying more than the average amount of our time for six months. But, if we are going to have prosperity until next Summer, then one symptom should be relatively low speculative activity. Last Spring, for a few months, this symptom was decidedly pessimistic. Stock prices were high and activity on the exchange was large. Business houses were placing orders well in advance of their needs. Here and there a commodity like sugar was developing a run-away market. But last Fall that was changed. Stock prices were below normal. Business houses were buying from hand-to-mouth, commodity speculation was at a low ebb. We shall have to score the first point for the optimists, so far as the next few months are concerned.

However, let us not take a single symptom too seriously. There is no greater danger in business forecasting than to think that, if at some time in the past, a given symptom of business health was followed by a given outcome, then that every time that same symptom appears in the future it must be followed by the same outcome, and that there can be no other, no matter how surrounding conditions may vary. Surrounding conditions do vary, and results must vary with them. Let us look, then, at some further symptoms.

If we are to have an immediate business decline, then one of the symptoms should have been a production of goods above what is necessary to maintain the ordinary standards of living. This carries a danger of accumulating inventories and of frozen credits. Here, again, the optimists score for the next six months, the pessimists for the longer outlook. Production in the United States and Canada last Fall was not so large as is necessary to maintain average standards, though lately it is larger.

---

*First of two installments of address delivred before the Illinois Manufacturers' Costs Association at luncheon meeting, March 18, 924.)

We cannot fully appraise the measuring of any given domestic production till we also consider the foreign trade movement. Heavy exports, without balancing imports, may aid greatly in reducing inventories; or heavy imports, without balancing exports, may mean that inventories are being built up. Here the pessimists score. For a few months last Fall the figure was optimistic but it soon came back to the pessimistic side.

Variation of Inventories

So far, in considering the relationship between available supplies and probable demand, we have assumed that inventories accumulate whenever the supplies exceed average demand. But that is not necessarily true at all times, any more than it is necessarily true that inventories are always being reduced when new supplies are less than average demand. We could all live below our average standard without actual physical suffering, and I am sure we should all like to live above our average standard if we had the purchasing power. And sometimes, for months or even for years at a time, we do vary from that standard.

Furthermore, we use much of our current supply in semi-permanent improvements, such as construction work, which nearly alway moves in great waves, either above or below the average. The test or symptom of what lies ahead, in this respect, is to be found in the relative intensity with which existing purchasing power is being used. If it is being used to the limit, or nearly so, then it is hard to expect further expansion and there is real danger of a drop. However, if there exists unused purchasing power, the outlook is optimistic. And here, again, the optimists score for the nearby months, pessimists for the end of the year. In all months up to January, of this year the intensity of this turn-over was less than normal, and an expansion of buying waited only on the decision of the owners of those deposits.

Of course, most bank deposits are only bank loans in another form. Therefore, the significance of this fourth symptom is necessarily qualified by the probabilities that current bank losses may be either expanded or contracted. There are dozens of ways of measuring the probabilities, but I like best to take the simplest ones.

If the price of money—that is the commercial paper rate—is below average, the supply must exceed demand, and the probability is for expansion. If the rate is higher than the average, then present demand exceeds the supply, and the probability is for contraction. The symptom here favors the optimists. Rates in New York, one of the world's two great money centers, have been and still are below the average, indicating that the surplus of bank deposits is not likely to be taken away by a contraction of loans, but may even be expanded a little further.

Symptoms In London

We can go on for another symptom to London, the other great money market, and there we find rates of last Fall below the average, which again we score for the optimists, as a symptom for the next few months.

The symptoms covered so far are those regularly and mathematically covered by the general barometer chart of the Brookmore Economic Service. On balance they indicate that business is in a condition healthy enough to go on for another six or eight months or, in other words, they fit in with the third opinion which is that the reaction of the past Summer and Fall has been a temporary setback, that business will score a considerable improvement this Spring and that no long continued decline will start before the Fall of 1924.

(To be concluded)

"Do" and "Don't" Suggestions to Avoid Factory Fires, by Chicago's Fire Chief

JOHN C. McDONNELL, Chief of Fire Prevention and Public Safety of the Chicago Fire Department and acknowledged to be one of the best-posted men on fire prevention in this country, has furnished the Illinois Manufacturers' Association with the following valuable suggestions to manufacturers who want to avoid fires:

"DO" SUGGESTIONS

By the Bureau of Fire Prevention and Public Safety.

Swing all EXIT doors outward.

Keep all aisles and passages to EXITS and FIRE ESCAPES free, unobstructed and direct.

Keep all windows leading to FIRE ESCAPES unlocked and ready for use.

Keep FIRE ESCAPES painted and in good condition.

Maintain EXIT and FIRE ESCAPE signs and lights where necessary.

Provide suitable metal containers for rags, papers, excelsior and similar rubbish.

Remove rubbish from your premises daily.

Isolate, or at least properly protect, all hazardous processes where volatile oils, gases or materials are used.

Notify the Chicago Bureau of Fire Prevention and Public Safety before installing any oil storage tanks.

Keep gasoline, benzine and other volatile oils in approved safety cans.

Install and keep in good condition, all fire fighting equipment.

Provide metal lockers for workmen's clothes.

Protect your building against your neighbor's fire hazards.

Where possible, organize a fire brigade for your own protection.

Acquaint yourself, your employes and members of your household regarding the nearest fire alarm box and how to operate it. Keep a box key available if same is a key box.

In case of small or suspected fire, in Chicago, phone "FIRE 1313."

Good suggestions for fire prevention can be found in publications of the National Fire Protection Association, 40 Central St., Boston, Mass.

"DON'T" SUGGESTIONS

By the Bureau of Fire Prevention and Public Safety.

Don't lock EXIT doors while building is occupied.

Don't obstruct aisles, passages nor corridors leading to exits and fire escapes.

Don't keep gasoline, benzine, etc., in ordinary cans.

Don't put gasoline, benzine, etc., on a fire escape.

Don't install an oil tank without notifying the Bureau of Fire Prevention and Public Safety.

Don't allow hazardous processes to remain unobstructed.

Don't allow a careless neighbor to endanger your building, life and merchandise.

Don't allow paper, rags and similar rubbish to accumulate.

Don't put rubbish in other than metal containers.

Don't tamper with electric wiring.

Don't fail to inspect all fire fighting equipment regularly.

Don't pile stock closer than 18 inches to ceiling and sprinkler heads.

Don't obstruct fire doors with merchandise.

Don't set ovens, ranges, furnaces nor boilers on combustible floor.

Don't construct dry rooms of combustible material.

Don't allow fire escapes to rust.

Don't permit smoking in a building where a large amount of combustible material is stored or where a hazardous process is carried on.

Don't fail to provide yourself with a fire box key, where necessary.

Don't overlook the advantage of your own fire brigade.

The January fire loss in Illinois amounted to $4,462,332, according to the monthly report of State Fire Marshal John G. Gamber. An overheated bearing caused the Corn Products loss, and this gave friction from running machinery first place among the list of causes of fires for the month, with $1,000,461. Other leading causes were: stoves and furnaces, $332,256; sparks on roofs, $273,193; electricity, $247,306; exposure, $233,182; defective or overheated flues, $174,233; spontaneous combustion, $160,847; petroleum and its products, $130,959; matches and smoking, $101,450. Factories suffered the largest loss, with $1,574,025; stores were next, with $895,257.

Boycott by Housewife and Market Hurt Sugar in 1923

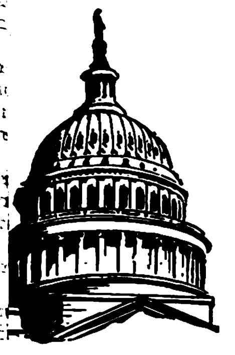
Last year was unprofitable for sugar refiners, but profitable for producers, according to Earl D. Babst, President of the American Sugar Company. He mentions the housewives' boycott and the wide swings and constant fluctuations in prices as the causes. Thus, the Company refined 1,165,000 tons of raw sugar last year, with a loss of $1,693,070, whereas in 1922 about 1,650,000 tons brought a profit of $10,083,932. But the Company received profits of $8,508,163 from investments, etc., and $4,542,631 from sales of real estate, although this is carried as a reserve. Including the profit on investments sold and income from investments, the Company earned $12 a share on its $45,000,000 common stock, after preferred dividends, compared with $12.01 a share in 1922. Excluding the profit on investments sold, the surplus, after preferred dividends for 1023, was equal to $1.92 a share on the common.

Public Demands Action by Congress

Popular Outcry for Constructive Legislation Heeded; Lakes-to-Gulf Waterway Plan Faces Crisis in House

By JOHN M. TOWNSEND

Washington Correspondent, Manufacturers News



Washington, D. C., Mar. 26.—Washington has not yet got out of the doldrums of non-legislation, occasioned by the investigating habit which still infects the veins of Congress. Neverthe-ss, out of respect to the demand of the untry that Congress do something be-des investigate, some of the appropriation lls have begun to move and the outlook r real legislation has slightly improved. side from taxation and bonus legislation, owever, there is little certainty as to what e legislative wheels will grind out.

PROGRESS OF INVESTIGATIONS—With the refusal of Harry F. Sinclair to nswer any further questions of the Sen-te Oil Investigating Committee, on the round that all questions at issue between he Government and himself have now been aken into court for a judicial determina-on, the work of that Committee is coming apidly to a close. It remains yet to be een, however, what the Committee will do with Mr. Sinclair because of his refusal to estify further. In the meantime, the Daugherty investigation is proceeding teadily, without, however, much direct evi-ence relative to the Attorney General offi-ially. Practically all of the leads thus ar established by the Committee have run o friends of Mr. Daugherty, rather than o himself, or up blind alleys. This investi-ation promises to continue indefinitely. he investigation of the Internal Revenue Bureau of the Treasury and of the Shipping Board, by a committee of the House, has only begun. This Congress, therefore, will have some form of investigation under way at all times, some of which will probably be continued well into the Summer.

RIGHTS OF INVESTIGATORS—Apparently, Mr. Sinclair has determined to ake into court the question of the right of congressional committees to compel private citizens to testify and to bring their books and papers. This question has never been definitely determined in all its aspects anywhere. Of course, in this particular instance Mr. Sinclair stands in the position of having become a partner of the Government in an oil lease belonging to the Government. His objection to further testimony at this time rests primarily on the proposition that no citizen should be asked to give evidence relative to matters concerning which the investigating committee has itself inspired a prosecution before another branch of the Government. Furthermore, Mr. Sinclair declined to be put in a position where he would have to refuse testimony on the ground that he "might incriminate himself," whereas, as a matter of fact, he denies that he has been incriminated. While Sinclair's objections are technical, with respect to the situation before him personally, his refusal to testify has raised the broader and more general question as to the right of congressional committees to interrogate witnesses about their affairs in a manner which has resulted in the present atmosphere in Washington surrounding most congressional investigations. The issue really hangs on the question as to whether or not a committee of Congress has the right to invoke judicial procedure in any case which does not relate to matters pertaining directly to legislation, or to the defense of the honor and good name of Congress itself, or to impeachment proceedings in which Congress is given a judicial status by the Constitution. No two cases relative to the rights of the legislative body to compel testimony, upon which decisions have been rendered, stand exactly on all fours, and even if fought out in the courts, it is possible that the learned judges will again prefer to decide with emphasis upon the technicalities connected with the position in which Sinclair finds himself rather than upon the broader legal question which involves the right of any witness who may be called before Congress at any time. The determination to test the issue really arises from the fact that Congress has no rules of evidence in taking testimony and frequently goes far afield in its researches.

HON. CHARLES B. WARREN

Newly Appointed Ambassador to Mexico Leaving the White House After Conference With President

TAXATION LEGISLATION—The Tax Bill passed by the House has become stalled in the Senate Committee on Finance, where it is likely to remain for some time to come. Up to this time, it has been impossible to get the members of the Finance Committee to act with expedition on the measure, some of the members being engaged in investigations and others having to make up quorums in the Senate while the balance of their colleagues investigate. Thus far, only a few of the paragraphs of the House Bill have been acted upon by the Committee. In the meantime, the Democrats have launched an attack on the Treasury reports relative to the amount of surplus revenues now in the Treasury or which may be expected to be there in 1924, when the appropriations of this Congress are effective, and also in 1925. The purpose of the attack is to show that there will be a larger surplus than Secretary Mellon is willing to admit, thereby making it possible for Congress to pass a tax bill different from the Mellon Plan and also a Bonus Bill carrying a provision for a cash bonus in lieu of the insurance provision in the House Bill, if the veterans prefer it. President Coolidge has recently summoned the House and Senate leaders to the White House to confer with him on the legislative program of this session and he has especially urged that the Senate give early consideration to the Tax Bill, but thus far his plea has not been productive of results.

THE BONUS BILL—At this time there is a considerable coterie in the Senate which favors passing the Bonus Bill ahead of the Tax Bill on the ground that Congress cannot know until the Bonus Bill is passed just how much revenue the Treasury will need. In other words, the advocates of the cash bonus plan desire to make their fight for the cash bonus without any hindrance on the part of a tax bill which by its limitations in revenue due to tax reduction, would materially reduce if not entirely wipe out any surplus which might be applied to the payment of a cash bonus. The Bonus Bill, as passed by the House, is a straight insurance bill, except that veterans who are entitled to a cash payment of less than $50 are to be paid in full, as well as the heirs of those soldiers who died in battle or since the war. At the end of twenty years these insurance policies will be considered as fully paid up, and, in the meantime, after a lapse of two years, the holders of the policies may borrow on them up to 90 per cent of the face value. It is estimated that this Bill will cost the Government about $2,150,000,000 in twenty years, in annual installments of about $100,000,000 each. It can safely be said that the House Bonus Bill comes nearer satisfying President Coolidge than any bonus measure heretofore proposed, but at this particular time it would not be any safer to assume that he would sign the bill than to assume that he would not sign it. So far as a heavy cash bonus bill is concerned, it can be set down now, as heretofore, that the President will not sign it unless it carries with it some taxation provision which will raise revenue enough to pay for it. This struggle for precedence between the Bonus and the Tax Bills will be determined shortly, after which the Finance Committee will have to decide whether it will add a cash bonus provision to the House Bill.

CHICAGO WATERWAY PLANS IN JEOPARDY—Plans of the Sanitary District Board of Chicago for the further extension of the Chicago sanitary system, for the development of waterpower, and for the opening of a Lakes-to-the-Gulf waterway, really face a crisis in the near future. At the present time, the right of the Sanitary District to take 10,000 cubic feet of water per second from Lake Michigan is being contested in the courts by the Government, at the instance of Canada and half a dozen Lake States, which contend that navigation on the Lakes is being adversely affected by a lowering of lake levels consequent upon this flow. In the meantime, Representative W. E. Hull of Illinois has offered a bill for the improvement of the Illinois River for waterway purposes, which has met with a hostile reception in the House Committee on Rivers and Harbors, and hearings on the measure, after being begun, have been arbitrarily set over until April 14. Secretary of War Weeks has gone on record against the diversion of 10,000 cubic feet of water by the Sanitary District, and he is backed up by the Chief of the Army Engineers' Corps. The outlook for remedial legislation at this session of Congress is not good, and in all probability the first final decision on the subject will come from the Supreme Court, which has set the waterway case for hearing on Nov. 10.

1,000,000 Left Farms for City

At least 1,000,000 persons left the farms and went to the cities last year, according to figures compiled by the Sears-Roebuck Agricultural Foundation. This, coupled with the fact that the population of the country had increased 1,400,000 during the year, means, roughly, that there are 2,400,000 more persons to feed with 1,000,000 fewer persons to feed them. The Foundation pointed out that the situation is so serious as to warrant immediate relief for the farmers. The report stated that in every other respect the farm outlook is very good.

"Leviathan" Named Fastest Ship Plying Atlantic Ocean

The S. S. "Leviathan," operating under the United States Lines, is officially announced as the vessel maintaining the highest average speed in the Atlantic steamship service, according to the Atlantic Conference of Trans-Atlantic Steamship Lines with headquarters in Brussels.

The place of honor is awarded the "Leviathan" following the minute checkup of the runs of all the passenger vessels during last season. The conference keeps close records of all trips made by steamships operated by companies in the organization.

According to the conference figures the speedy ships of the North Atlantic and their standing are as follows: "Leviathan," first, with an average speed of 23.57 knots; "Mauretania," second, 23.51 knots; "Majestic," third, 23.29 knots; "Aquitania," fourth, 22.65 knots; "Berengaria," fifth, 22.27 knots; "Olympic," sixth, 21.44 knots.

What's Coming *in* MANUFACTURERS NEWS

for the Issues of April and May

Don't miss these splendid articles and the ones to follow.

What a Funny Thing a Whale Are - - - - - - - BOB BECKER
Some fishing stories that will make you smile.

Importance of Accounting to Management
A. R. ERSKINE, President, The Studebaker Corp.
One of the many good cost addresses which are appearing regularly in this magazine.

Brushing Up On Your Golf Game for the Coming Season
"CHICK" EVANS
A golf article that will help you to get in shape at the beginning of the golf season.

Reviving the "Apparently Dead" - - - Capt G. R. C. FISHER
A series of lectures on "Safety" which are being applied in some of the largest manufacturing concerns in the Middle West.

What's Coming in Radio - - - - - - - - Dr. J. H. DELLINGER
Chief of Radio Laboratory, Bureau of Standards
Tells of some of the wonders of the latest and most popular science of today.

Minority of Minority Rules in U. S. - - - - - - - WM. H. BARR
President, National Founders Association
Showing figures on average voter's indifference and why business men should take active interest in ballot.

Golf — Some Interesting Phases of It - - - - - - - C. A. PACKARD
A series of three stories.

A Training Program for the Factory Foreman - - J. K. NOVINS
Of interest to executives. This series begins next month and is sure to have your careful attention. **See Page 13 of this issue.**

WILBUR D. NESBIT with another of his latest poems that please, etc.

Wolff Joins Buckley, Dement & Co.

Harold A. Wolff, well known among Chicago advertising men, has joined the staff of Buckley, Dement & Company, direct mail producers. Mr. Wolff will assist Mr. Buckley as a contact man in merchandising and service. He was formerly associated with the Brunswick Company.

Heads Domestic Commerce Bureau

Secretary of Commerce Hoover announced the appointment of Henry H. Morse, present Chief of the Specialties Division of the Bureau of Foreign and Domestic Commerce, as Chief of the Division of Domestic Commerce of that Bureau t succeed Irving S. Paull, present incumbent, who has tendered his resignation.

H. G. P. Deans Re-elected

The Bankers' Association for Foreign Exchange has re-elected H. G. P. Deans, Chicago, as its President and elected the following officers: F. M. Horton, Cleveland, First Vice-President; G. N. Mohler, Cincinnati, Second Vice-President; Fred W. Allen, Chicago, Secretary, and F. C. Clifford, Milwaukee, Treasurer. Mr. Deans is Vice-President of the Illinois Merchants Trust Company, and is one of the best known authorities on foreign exchange in the Middle West.

Pennsylvania Safety Council

"Preventing Accidents" and "Conserving Health" will be the two main topics to be discussed at a safety conference of the Engineering Section, National Safety Council, in Pittsburgh, April 1, under the auspices of the Western Pennsylvania Division of the National Safety Council.

John W. Mack Killed

John W. Mack, inventor of the Mack Truck, and founder of the Mack Motor Car Company, now the International Motor Company, was instantly killed recently near Neffs, Pa., when a work car of the Lehigh Valley Transit Company crashed into the automobile he was driving.

onverting Men Into Real Producers

Proper Education of Industrial Apprentices Would Eliminate Untrained Workmen and Labor Turn-over

By J. F. KOLB
Illinois State Supervisor of Industrial Education

INDUSTRY does not and cannot live to itself alone. Its products acquire merit or demerit from total community, state or national conditions. ce industrial production depends on ac- ired abilities of individuals to produce, ich results from education, training and perience of varying value, the community ould periodically take an invoice of ex- ing means of increasing the value of its oducers.

When we complain of the quality or uantity of production we are unconsciously criticizing our methods of educating and aining our producers.

This criticism is usually expressed in ne or more of the following ways depend- g on the point of view of the individual peaking:

The quality of our product is not high enough successfully meet competition, and we can't hange the quality much with our present working force.

Our men do not turn out a fair day's work for he wage paid.

Our working force is not a convertible one.

There are too many handymen working in our raft.

There are too many specialists, such as ma- hine-tenders, in our trade.

Last, and possibly the most potent, is the statement, "the cost is prohibitive. I think I will wait till later to buy"; or, as one gentleman expressed himself, "they have induced me to engage in that type of enterprise for the last time."

Criticism of this type is valuable only when it compels us to unite in analytical investigation which will lead to an introduction of the right kind of corrective measures.

In analyzing this situation it is apparent that industry has in many cases taken advantage of the extended use of improved machinery and, further, that they are continuing to improve machines at a rapid rate with the hope of eliminating the human element, at least to a large degree. However, the manufacturing and building industries have overlooked the possibilities of building larger and more lucrative business by converting our most valuable natural asset (men) into extremely valuable producers who, as they were developed, would very soon replace one of the most disturbing elements in modern business—the untrained or partially trained workman.

A dearth of skilled labor in many fields has compelled unconscionable competition for the services of the few at unreasonably high wages or salaries on a comparative basis, and in most cases a distinct loss in production because of the acute shortage of a high grade labor supply has been felt keenly by everybody. The responsibility for these conditions cannot be charged to the failure of any particular group but every citizen must admit his responsibility for this condition and then, in the interest of himself, his community, state and nation, help in the correction of a bad situation, which no doubt will become worse as time passes, if he does not act.

Addresses of E. M. Hicok and F. W. Hansen in Pamphlet Form

SEVERAL requests have been received by MANUFACTURERS NEWS for the publication of the address of E. M. Hicok of the Western Electric Company, Chicago, and President of the Illinois Manufacturers' Costs Association, before the Southern Division of the Association at St. Louis on Feb. 15, on "Some Inventory Methods As Developed by the Western Electric Company," and the address of F. W. Hansen, Auditor for the Weller Manufacturing Company, Chicago, before the Association at Chicago on Feb. 28, on "The Proper Segregation and Distribution of Labor and Expense for Accurate Costs."

Owing to lack of space it will be impossible for MANUFACTURERS NEWS to publish these two interesting papers. However, the Illinois Manufacturers' Association will publish them in pamphlet form, and they may be obtained by writing to John M. Glenn, Secretary of the Association, 76 West Monroe Street, Chicago.

There are several important factors to be considered in the development of a better producer, such as:

1. Changing public opinion of the relative values of people engaged in different occupations.
2. Education and training to correct deficiencies in present working force.
3. Taking the precaution to prepare prospective employes with the thought of eliminating losses due to transition from present activity (school) to desirable employment, and continuing the development of each after employment.

Approval Stimulates Ambition

One of the most important means of developing better producers is to encourage the public to admit the importance of any productive occupation carried on in a community and to accord the people engaged in that occupation the approval that every man seeks and which stimulates ambition and growth. Public opinion changes slowly, but anything done to eliminate the stigma now attached to industrial employment will be eminently worth-while in promoting the advancement of the majority of our people.

Education or training to correct deficiencies in our present working force is the next step, and should be as thorough as time and available facilities will permit. In undertaking this work the schools, employers and employes should take advantage of all existing schemes. Better training of industrial employes in the evening vocational classes for adult journeymen workers and part-time day vocational classes for apprentices in industry could be employed. Further, a part of the training of the apprentice or journeyman could be given effectively on the job, providing time and men having instructional ability could be detailed to this service.

Workmen cannot, in most cases, under present conditions, learn the entire trade and all they should know about a given process or operation, merely because, as a rule, everyone has expected "George" to take care of the job, and "George" has been too busy trying to get some other fellow to do it. Every one engaged in trade and industrial occupations realizes that there is much about his job that he does not know. In production he finds no way of acquiring the information and experience, because there has been no concerted effort —and very little individual effort—to discover the means of helping him obtain the aid he needs. Further, few of the men in the different crafts possess the ability to use the mathematics and science connected with their occupation which are almost indispensable for successful performance of many types of work they are called upon to execute.

Vocational Schools An Aid

Much of the needed education and training can be given through the public schools, which today are better equipped and more able to help those needing training, experience and education necessary to teach them the use of mathematics, science, etc., applicable in their trades. The problem of training the present working force should be a continuing one, employers or employes constantly taking advantage of the possibility of placing the working force on a higher plane—both educationally and from a productive point of view.

One of the sources of annoyance in many industries has been that of inducting into the business young people who do not know whether they were really interested in the occupation and who had no preparation which would make it easy for them to pass from the schools to employment they would not be able to discharge or which might prove to be distasteful. In other words, it was an entirely new field with which they were wholly unacquainted, and too often the lack of appreciation of the requirements of the occupation and lack of assurance that they would be properly trained have led embryo mechanics to become dissatisfied, causing an appalling and disastrous labor turn-over.

Since ever-increasing numbers of young people are continuing their education to and sometimes through the high school, a large portion of whom will undoubtedly engage in productive effort in the trades or industries, many of them could be induced to enroll in vocational full-time classes for the purpose of preparing for industrial employment with profit to themselves and to the community. With the education, training, and experience of preparing for industrial occupation, gained in the school, they would be able much more readily to make the transition from school to employment and, because of their training and experience, would not make as many mistakes in selecting employment as they do today. This would help reduce the personnel turn-over.

The co-operation of the employers, employes, local school boards, and the Illinois Board for Vocational Education can effectively meet the needs of the groups above mentioned. Employers and employes should consult the members of their local school boards and at the same time write this office notifying us that they are interested in the establishment of industrial classes in their community. We will then exert every effort to assist in the establishent and maintenance of such classes.

Tax on Final Sales Offers the Safest Form for Farmer, Says Ira C. Copley

"THE natural instinct of self-preservation urges every man to pass on to some one else any tax which can be thus shifted. Most of the excess profits taxes on business are capable of shifting in one way or another," said Hon. Ira C. Copley of Aurora, Ill., in an address before the recent Farmer-Manufacturer Convention in Chicago on "Taxation."

"If the tax comes from a local merchant, he can add it to the price of his merchandise, and again human nature leads all the smaller merchants, who do not have such high taxes to pay, to bring their prices up in line. The seller can do the same, as can also the manufacturer or producer, whose market is limited. It all falls on the shoulders of the ultimate consumer in the higher prices he pays for everything he uses.

"The farmer is almost the only fellow who can't do this, because his market is the market of the world. Therefore, he pays every other man's excess profits taxes, and has no excess profit of his own to offset it.

"In the matter of high surtaxes, the same principle applies. They are shifted, as far as possible, and again fall on the same victim—the ultimate consumer. The surtaxes collected on the largest incomes are only one-sixth of what they were when the tax law was first passed. The Government is not getting the money. The public is paying the penalty. The enormous increase in tax-exempt securities has created an artificial market for money, or rather, it has thrown a dam across the great lake of money from which borrowers draw, and we are maintaining two levels, one for the taxable, the other for the tax-exempt. Every business of every nature that borrows money pays a higher rate because of the working of these two forces, the surtaxes on high incomes, and their ability to take refuge in tax-exempt securities.

"The pool of money from which business draws its needs has been very much reduced. Therefore, rates are higher. The manufacturer pays more for what he uses; so does the wholesaler and the retailer; in fact, every producing or distributing agent does, and this cost is added to the price of all commodities. The railroads pay more for their money, so their freight rates must be higher. The price of grain and all farm products is made in the great centers. Liverpool is the wheat market of the world, and fixes the world's prices. When freight rates go up, the wheat raisers of the Middle West and Northwest have to deduct from their prices the rate increase necessary to get their grain on the world's market. They pay in great part these surtaxes, if they would only realize it, and the Government doesn't get the money.

"So, the farmer is almost the only class which pays from both ends, as the ultimate consumer, and as a direct deduction from the price of his products. He has been the bulwark of this Republic, but he goes 'bug house' about once a generation. He is very much helped in this 'jazz jag' by the demagogs in politics. They almost stampeded him for free greenbacks in 1876; for free silver in 1896. In both of these instances, he alone would have paid the greatest part of the bill. Now the bloc representing him in Congress tries to make him think that some other fellow is going to pay his fair share of the taxes, and in this contest of wits, the farmer finds himself paying, not only his own share of the taxes, but a great part of the other fellow's.

"He has always returned to his senses within a short time, and in every period has again become the stabilizing influence of this Government. When he finally grasps the fact that the ultimate consumer pays practically all taxes, and in direct ratio to his purchases, the farmer will agree with the business men that a tax which gathers the most money from the sources which it was intended to tax, and furnishes the least incentive to pass those taxes on, is going to be the cheapest way for him to *get out.* Then he must inevitably come to the conclusion that a tax on final sales *offers* the fairest and safest form of tax for him."

Service for Farmers the Plan of New Organization

James R. Howard, former President of the American Farm Bureau Federation, and H. W. Moorhouse have joined forces in a new organization to render an agricultural business service known as Howard-Moorhouse, Inc., with offices at 58 East Washington Street, Chicago. This new service will attempt to interpret the theoretical valuation estimates of crops and live stock, as issued by the Federal Government, and the actual sales figures, which, Mr. Moorhouse points out, frequently differ between $5,000,000,000 and $10,000,000,000 a year.

"Business men realize that agriculture in America is passing from pioneering to permanent building, and they also appreciate the interrelationship of the farmer and the business man," said Mr. Howard in explaining the service his new organization will perform.

World Production of Coal

The world's total production of all coal in 1923 was approximately 1,335,000,000 metric tons, according to the United States Geological Survey. In comparison with the preceding year this was an increase of 112,000,000 tons, and it was but 7,000,000 less than the output in 1913, when the high record was established. The world's output in 1923 was 16,000,000 tons larger than in 1920, an increase that was largely due to recovery in the production of the United Kingdom, France, Poland, and Russia.

Railroad Problem in U. S. Explained by N. Y. Bank

Fundamental economic principles involved in what is popularly characterized as the "Railroad Problem" are dealt with in a little book published by the Bank of the Manhattan Company, New York, entitled "The American Way." This is the second volume of "The Manhattan Library," the first being "The Greatest Family *in the* World."

There is widespread interest these days for fundamental economic information, in non-technical form, that is capable of being easily understood, and this series of booklets by the Bank of the Manhattan Company is disseminating such information—an intelligent and helpful service to their customers, their community and the country at large.

John W. Eldredge Is Dead

John W. Eldredge, Vice-President of the National Sewing Machine Company, Belvidere, Ill., died recently at his home in that city. He was 49 years old.

Training for Factory Foremen

BEGINNING on May 3, MANUFACTURERS NEWS will publish the first of a series of twelve articles on

A TRAINING PROGRAM FOR THE FACTORY FOREMAN.

This series which will appear each week, is practical, constructive and complete. It is one of the most interesting presentations of the subject that has been written. There is not a dull line in it. It is devoid of untried theories and contains no superfluous bunk. The articles are written by J. K. Novins, a New York industrial engineer.

It is the kind of matter that will appeal from the first article to any progressive factory executive.

Every successful manufacturer knows that his profits depend largely upon the efficiency of his foremen and their ability to win the co-operation of employes. Foreman-training has been receiving as much attention during the last few years as the equally important matter of factory costs. The series deals with the following subjects:

1. The Factory Foreman Today.
2. Assimilating the Factory Foreman.
3. What Shall the Foreman Study?
4. How Shall the Foreman Study?
5. When and Where Shall the Foreman Study?
6. Who Shall Teach the Foreman?
7. Picking the Foreman-Student.
8. Planning the Routine of the Group Conference.
9. Outlining the Foreman-Study Course.
10. The Federal Board Plan for Foreman Training.
11. Choosing Text Material for the Foreman Conference.
12. Sources of Information for the Foreman Group in the Industrial Plant.

Step by step factory executives are shown how they can, by proper instruction and friendly conferences with their foremen, obtain almost immediate results in

Increased production.
Improved management of men and machines.
Reduction of errors and complaints arising from work under supervision.
Elimination of waste and spoilage.
More friendly relations between employes and management.
Development of weak points in the organization.
Bringing out and making better use of strong points in the factory management.
Development of team work.
Arousing interest in winning promotion.
Proper understanding of the economics of industry.
Proper handling of equipment and material.

We know you will be interested in this series. We know that, after you have read the first article, you will recognize its practical worth and that you will put its valuable suggesions, as far as you can, into practice.

TRANSPORTATION

Pennsylvania Railroad Plans to Add Norfolk & Western Line As Subsidiary, Giving Greatest Mileage In U. S.

THE Pennsylvania Railroad is planning to add sufficient track mileage to the System to make it, without question, the largest railroad system in the United States. The Santa Fe now holds that position, its directly operated first-track mileage now totaling 11,710 miles against 11,684 for the Pennsylvania.

The Eastern road, however, is negotiating for a leasing arrangement with the Norfolk & Western to operate its 2,238 miles of track. With this addition, if plans now being worked out by committees representing both transportation companies are completed, will bring the Pennsylvania and its subsidiary operating companies up to a total of 13,912 miles, forming a close network over the whole territory from Chicago to New York at the North, and Norfolk, Va., at the South.

The Norfolk & Western connects with the Pennsylvania System at Cincinnati, Columbus and Norfolk.

Radio on C. N. R. Trains

The latest train on the Canadian National Railways to be equipped with radio receiving sets is the International Limited, the crack passenger train running daily between Montreal and Chicago. This train has radio equipment attached to the observation car. In addition to the loud speaker, there are eight pairs of head phones. The Canadian National Railways, in addition to utilizing independent broadcasting stations, has a powerful broadcasting station of its own situated in Ottawa.

Ford's R. R. Lost $98,207 in 4 Years

Henry Ford's railroad, the Detroit, Toledo & Ironton, operated as a "plant facility," has lost its owner $98,207 in the four years of operation, it is declared in a report by the Committee on Public Relations of the Eastern railroads. This loss was incurred, the report continued, despite the fact that between 1920 and 1923 the movement of automobiles increased from 14,000 tons to 1,271,000 tons.

Consolidate Chicago Offices

Consolidation of the Chicago offices of the Pacific Steamship Company, Admiral-Oriental Line and Dollar Steamship Line is announced by R. Stanley Dollar, Vice-President of the Dollar Steamship Line. It was stated that the consolidation of the Chicago offices in no way affects the status of the three companies as separate organizations. R. W. Bruce is made General Agent of the consolidated offices, with headquarters at 112 West Adams Street, Chicago. He was formerly agent of the Admiral-Oriental Line at Kobe and Shanghai, and General Agent at Chicago. R. W. Proudfoot, General Agent of the Dollar Steamship Line at Chicago, has been promoted to General Agent for the Southern California territory, with headquarters at Los Angeles.

Southern R. R. to Pay Dividend

After a wait of thirty years, owners of the $120,000,000 of common stock of the Southern Railroad are again to receive a dividend. Directors of the road, at a recent meeting, voted a quarterly payment of $1.25, which establishes the stock on a $5 annual rate. This is the first dividend paid on this stock since the road was reorganized in 1894. During this time earnings have been put back into the property and the System expanded throughout the South, until now it is the sixth largest system in the country, operating about 9,500 miles of road.

Capital expenditures since 1906 have totaled $145,000,000, in addition to more than $50,000,000 derived from surplus earnings. There has been a steady growth in earning power. In 1922 gross income was $24,956,246 and surplus from operations was $7,323,797. Gross income for last year is estimated around $31,700,000, marking the best year in the company's history. The railway's securities total approximately $455,000,000, of which $275,000,000 is in bonds, $60,000,000 5 per cent preferred stock, and $120,000,000 common stock.

427 Miles Built in 1923

Construction of new railway lines in the United States continued to be very small in 1923, according to the Bureau of Railway Economics, but there was a marked increase in the construction of second track for the purpose of double-tracking lines of heavy traffic.

The new lines built consisted of only 427 miles. With the exception of the years 1920 and 1922, this is the smallest mileage ever reported to have been built in a year. On the other hand, there were 684 miles of line double-tracked, as compared with 196 miles in 1922 and 143 miles in 1921.

Abandoned and actually torn-up lines amounted to 129 miles, while 384 miles were abandoned, but not taken up. This was a reduction as compared with the record of recent years, and indicates that for the first time since 1915 there was a small net increase in the total mileage of railway line in the country.

To Remodel the "Ohio"
